**THE AMERICAN QUARTERLY REVIEW**, No. XXXV., new series, September. Philadelphia, L. R. BAILEY. New York, G. & C. CARVILL & Co.—There are papers in this number of great ability. We would instance that on "the Documentary History of the American Revolution," albeit it is sadly calculated to shake one's faith in the truth of History—and that on National Defence, which should be generally read. We shall hereafter make extracts from this latter paper.—To-day we devote all the space we can spare to extracts from the paper on *Audubon*—which vindicates, in a becoming strain, the character, veracity, ability, and perseverance of this enthusiastic man of genius.

We make these extracts without much connection, and leave them to speak for themselves:

Passing by for the present the names of a galaxy of worthies who have long rested with the glorious dead, we may confidently refer, as a living example, to him, the titles of whose works stand at the head of this article; who, for untiring zeal, singleness of purpose, and devotedness of heart, has never been surpassed by any devotee of that goddess who disclaims all *cabinet* courtship, and who may be wooed with success only at the foot of those altars sacred to her own cause.

The name of *Audubon*, already enrolled in the records of imperishable fame, will descend unsullied to the remotest posterity; will live and flourish when the insignificant few of his contemporaries, whose jealousies urged them to reckless efforts to despoil him of his dearly purchased honors, shall

long have been consigned to the oblivion of things that never were. Our readers are, most of them doubtless, familiar with the first volumes of both of his untitled works, the "Birds of America," and the interesting letter press entitled "Ornithological Biography." It is the object of the following pages to introduce to our author's compatriots the second volumes of those works. We enter upon this subject fully impressed with the difficulty of the task, aware that trans-Atlantic arbiters of taste and science have already wielded abler pens in the same cause. On opening his volumes of Ornithological Biography, the reader is charmed with the vein of active benevolence displayed towards the objects of his research, whom our author is ever disposed to view with a partial eye, as the companions of his early youth, and as friends of maturer age: not less striking in the fervent piety which breathes through all his pages, together with a keen sensibility to favors conferred, evinced in his frequent and liberal acknowledgements to his early patrons.

The volume before us, like its predecessor, is by no means confined to the dry details of the scientific descriptions of the objects so beautifully depicted in his great work; each species being presented in a style so familiar, easy and accurate, as to bring the reader into the actual presence of, and render him personally acquainted with the most attractive portion of the animal creation; thus furnishing a feast of reason adapted equally to the taste of the uninitiated and to the most profound. Each consecutive number, consisting of five plates, is followed by an episode, containing novel and interesting views of the manners and customs of the thinly settled portions of our country, liberally interspersed with curious anecdotes, derived from his intercourse with semi-civilized man, and occasional representations of natural scenery, unsurpassed in beauty in the dreams of romance. These little histories, which were originally introduced into his volumes of text with the view of relieving the monotony of scientific details, or for the amusement of the general reader, have now become important scraps of our author's Biography, and are perused with pleasure and profit by all descriptions of persons; they are in fact replete with information of a most important nature in several departments of science, besides enabling us to estimate at their true value the labors and almost unparalleled exertions of a successful and enthusiastic devotee in science.

From what has already been stated, it will be perceived that our animated author is seldom caught in the croaking mood; he nevertheless opens the second volume with the description of the *Reven*—a bird sacred to fabulous history, and possessing no very amiable character; he loses nothing certainly, in sitting for his portrait before a master hand. We now recognise in him, dispositions and habits as respectable as they are venerable, and which fully entitle him to the honor here reserved for him. But the limited space to which our observations are necessarily restricted, will not permit us to enlarge on the many remarkable beauties and curious features which present themselves in this department of the work; nor do we deem it necessary to adhere very closely to any particular order or arrangement. We may safely refer to his description of the Turkey-buzzard, as peculiarly graphic, and in many points highly important in a physiological view.

Mr. Audubon has been highly censured for some original observations on the power of smelling in this species, and published formerly in the Transactions of the Royal Society of Edinburgh. There were not wanting some closet naturalists, who, wedded to old prejudices, boldly impugned the veracity of his statements. The entire correctness, however, and strict union with nature, has been subsequently proved beyond the possibility of contradiction, by the institution of a series of labored and careful experiments, performed under the auspices of disinterested persons, and witnessed by many of the most eminent men of science, and most of the professors in the Medical School of Charleston, S. C. Every one whose mind is open to conviction, is now satisfied of the fact first announced by Mr. Audubon, that the turkey-buzzard is directed to his food by the power of vision, and not by the faculty of smelling, which exists indeed in rather an inferior degree in these animals;—thus casting back upon its source the foul aspersions of ignorance or malice.

But, to return to our author—whose reasonings have always facts and observations for a basis.—His accurate, and, we may say, *personal* acquaintance with the feathered tribes, we have enjoyed frequent and various opportunities of testing.—Sometimes at great distances, by their mode of flight; again, when nearer, yet out of sight, “by the tones of their voice,” or the melody of their song, were the various species recognised.

But the case of the *white headed eagle* furnishes a striking instance of his critical acumen, and must convince the most skeptical. At page 163 we have the following remarks on this bird:

“I have no doubt that in a state of confinement this species sometimes requires a long series of years before it obtains the full adult plumage, by which it is so distinctly characterized. There is now one living in the suburbs of Philadelphia, which was eight years in coming to its state of maturity. Almost every person who saw it in its brown dress, called it either a new species or a Golden Eagle! Nay, some said that it must be the pretended *Bird of Washington*! A friend took me to see it; I felt assured as to the species, and told him that his head and bill would become white and that its size, which was rather larger than common, was not such as to indicate a new species.”

This fine specimen, which is still living at Mr. M'Arar's garden, has been actually described as a new species by a naturalist of Philadelphia. Yet we are assured by those who witnessed the experiment, that the unerring *aquiline eye* of our author detected the species, and pronounced, with the certainty of brotherly recognition, that an old acquaintance stood before him, ere he had approached within several feet of the object; and although at the time not the least indication of a coming change of plumage was apparent, he asserted that it could not be long before the usual characters would be developed. In less than two years his predictions were verified.

But amidst the universal peans which resound far and near, to the merits of lofty genius and well tried talents, “what notes of discord are those which disturb the general joy, and silence the acclamations of victory? They are the notes of *John Hook*, hoarsely bawling through the *American camp*, beef! beef! beef!” (Vid. *Wirt's Life of Patrick Henry*, p. 374.)

'Tis true, the unassuming, confiding and modest historian of nature has his enemies, and perhaps there is no one whose brilliant productions are more calculated to excite *envy*; but fortunately, the intellectual force of our author's opponents falls far short of the activity and zeal which they have brought to bear in so unjust a cause. Otherwise we should have experienced a degree of mortification in confessing that these opponents are chiefly limited to Mr. Audubon's native countrymen. As it is, their vain efforts would be calculated to excite amusement, were it not for the malice by which in most instances they are characterized. In alluding to some of their unfounded charges, we shall assume the forbearance of Mr. Audubon, who has at all times abstained from mentioning the names of those who have so unjustly persecuted and reviled him. In this respect he has not only displayed a Christian virtue, but may find his account in having thus deprived those names of the only chance which they ever possessed of descending to posterity along with his imperishable works.

It is not requisite now to enter into any disquisitions to refute long exploded errors: in every instance it will be found, on close examination, that all the specified charges put forth to fix the stigma of mendacity to the name of our author, or to convict him of the base attempt to palm upon the public the spurious productions of a vitiated imagination, for grave truths in natural history, have invariably arisen out of the ignorance or malice of the accusers.

Thus the extraordinary and curious facts in the physiology and habits of the turkey-buzzard, so faithfully observed and accurately detailed by Mr. Audubon, were not only received with disdain, by his opponents, but were publicly cited as sufficient evidence of the ignorance and presumption of our author. At the present time, after the repeated and satisfactory experiments, instituted expressly to determine the disputed points, by numerous and highly reputable and disinterested witnesses, no one who entertains the least regard for his own reputation or honor, would presume to express a doubt. Not less satisfactory have proved

ed the results of subsequent investigations, by competent observers, on the “habit of climbing of the rattle-snake,” together with the occasional disposition of this animal to enter the water to swim—both of which facts had been repeatedly cited to reflect on the veracity of our author—and were even urged during a successful canvass for the election of Mr. Audubon as a member of the American Philosophical Society, as sufficient reasons for excluding him from its honors; but the mere positive assertions of inexperience and prejudice, failed before the published testimony of such observers as Gen. Jessup, Gen. Gibson, Col. Abert, Lieutenant Swift, &c. of the United States Army.

This active little band of brotherly censors have not confined their exertions to our own country; and they have found a most faithful correspondent and ally in the person of a Yorkshire “Wanderer,” who has passed the greater portion of his life in fruitless efforts to run away from his own shadow. He has published a work in England, on “Wandering,” in the preface of which he assures us, that “Sir Joseph Banks predicted that he would write a book,” which would “improve and extend materially the bounds of natural science.” We have waded through its pages, in vain, to discover the fruition of this prophecy. At page 37, we meet, in his own language, expressions admirably well calculated to enable the reader to estimate, at their true value, these abortive pages.—“Ludicrous extravagances! pleasing to those fond of the marvelous; and excellent matter for a distempered brain!” This able and active little censor, having of course nothing but the advancement of science at heart, and desirous to purify the pages of *Natural History* from the baneful *fables* which too frequently disfigure it, commenced an early warfare, ay! “war to the knife,” with the Author of the “*Ornithological Biography*,” whom he appears to have viewed from the commencement as a poacher on the manor which he considered peculiarly his own! He appears to be well supplied with materials for detraction, which will not appear strange, when it is known that one of the American band of censors has feasted at Walton Hall? How utterly fruitless would be the effort to deceive him, and save him from the effects of the hallucination under which he labors as regards the true character of Mr. Audubon, is well exemplified by a confession of his own, occurring at page 101 of his book, viz.: “When you once fancy that the thing you are looking at is really what you take it for, the more you look at it the more you are convinced that it is so.”

**THE UNVEILED HEART.**—A simple story by the author of early impressions. 1 vol. Boston. JOHN ALLEN & Co. For sale in New-York by WILEY & LONG.—The preface tells us, this prettily printed volume has no pretension to pass for a *novel*—and, certainly, so far as inspiring interest is one of the characteristics of a novel, it lacks that. It is a simple story, meant to unveil the heart, by a series of scenes such as may occur in real life—the design strikes us as better than the execution.

**THE LITTLE SCHOLAR LEARNING TO TALK.** JOHN ALLEN & Co.—A clever design cleverly executed. This is a picture book, which having first attracted the eye of childhood, is then made the vehicle of explanatory instruction, conveyed throughout in the tone and manner of a mother conversing with her children—and illustrated in each instance by a picture. It is quite worth buying.

**VISIT TO WORDSWORTH.**—The following extract is from one of the most recent of Mr. Brooke's letters from England.

We wound up the slope of the hill to present our letter of introduction to Mr. Wordsworth. My friend, to whom the letter especially belonged, rapped at the door of the Poet,—and I sat down on a neighboring ledge, and took out my writing materials, to note some of the peculiarities of this new scene. Before I had gone far with this, Mr. Wordsworth himself came out, and his cordial unaffected welcome, soon relieved me from all embarrassments. Among all the great men on the two sides of the ocean, whom it has been my fortune to see, he is

the only one whose real self, embodied the man whom my fancy had drawn. He dwelt too in some such place as I should suppose a poet to dwell. A lover of nature, he had sought the loveliest spot he could find; and he had found what ought to be, and what seems as if it were made to be, the very spot for such a man. He took us into his library, among his books, busts, and paintings,—and though there was nothing remarkable in such a study, yet it is pleasant to have been in the study, from which so much of beautiful poetry has come. He then walked with us over his grounds. Back of his dwelling is a mountain of some considerable height, on the side of which the house seems to stand. In front, on a little elevation, an artificial mound, called Rydal Mount (the name of his seat) he showed us a charming view of Windermere in the distance. Here with a poet's soul, he dwelt upon the beauty of the spot,—with no affectation, no display of words, but in that calm and quiet narration ever the offspring of natural feeling. “I live,” said he, “on other peoples' prospects. I have the finest view of Windermere, and yet it costs me nothing.” Here you see is what is gained by living over other peoples' heads. I have all their prospects, and my own too:—and I thought it was no bad speculation even for a Poet, to make such a purchase, as I saw in the glen below him, some pretty vales, and the little church with its Gothic tower just peeping through the trees. He took us next from this wide view, to Rydal water, a little lake, or pond as we should call it, at the base of the mountain—and as we went through a bower of burrs, with logs for seats, our eyes fell upon this lovely spot. No wonder, thought I, that you can write poetry in such a place, I even feel it in my own veins. We moved along through various walks that wound around the hill—now in wood, now in gardens, now in field, now on the slope of the hill, now on plain, and now on precipice almost—and then we returned to the cottage itself, all inwreathed in shrubbery and flowers. “The eye,” said he, “must study landscape scenery before it can properly love it. It needs training for this as it does for the proper perception of all the beauties of a great painting. An impression may be made—but the intense delight that a true lover of nature feels, in looking at a beautiful prospect, comes of education in part,—and I could well see that the maker and adorning of the charming spot, had studied nature as other people study books, not even forgetting the humblest blade of grass.”

The poet with an earnest hospitality, pressed us to partake of his dinner, which was already upon the table, some three or four hours earlier than a London dinner. There was no escaping such an invitation thus given, though there is nothing I dislike so much, as eating dinners on a letter of introduction—but as this was no dinner purposely prepared for guests, the objection was softened much. The conversation ran upon our country, and its resources, and its probable destiny. “Heaven grant,” said Mr. Wordsworth, “that your experiment may succeed. It is a bold and great one—and if it meets success, lifts men upward one further step—but I do not believe it will. There are too many in the world that will seize that splendid prize of yours—the chief magistracy, I mean—honestly if they can, but at any rate they will seize it, if they have to do it, even as Caesar did. I cannot believe,” he added, “your States will hold together. You count too much upon the moderation and virtue of all mankind—for one man who will demagogue much, can do infinite mischief, where he can act upon a whole people, who are in fact the whole government of the State.” I told him of our checks and balances, and all those bulwarks upon which we rely. The conversation then ran upon, what he termed, the utility of an aristocracy, that should in some degree concentrate wealth for the purpose of patronizing genius, and rearing up a society in which men of intellect and learning should live and flourish. I told him we must rely upon our mercantile wealth for all this—and then I pressed the question, of which was the better in the scale of human happiness, that the mass should flourish as with us, or the few as in Britain. The mass he contended were happy here, and had enough to eat and wear.—“The aristocracy and gentry provided for all the poor.” I shook my head, and only added that the mass seemed made for other purposes than to eat, drink, and wear. The conversation changed.—Thus do Englishmen and Americans differ. An Englishman has no idea of what a popular government, by ever impelling and exciting the mass to improvement, can do in elevating their minds and

characters, to say nothing of that lower object, the acquisition of property,—and what renders them doubtful of the principles of the mass, is its ferocity when excited here in England, and Ireland.—We have no such mobs unless it be in New York, which is getting to be a European city, that some chance or other has dropped on our side of the water.

After dinner, when we were introduced to the family of Wordsworth, who, received us with a hospitality as kind and as unembarrassing as his, he generously offered to conduct us to some of the scenery around, which we expressed some interest in seeing, as they were spots which his poetry has made known in America, as well as in England. I felt much reluctance in troubling such a guide,—but yet how pleasant it is, to have the Poet himself, in his own person, pointing out the vale and mountain, and lake, that his own pen has peopled with the beings of his own fancy! And how delightful this idea of consecrating one's own home, through all coming time, by throwing around it the enchantment of poetic fancy,—giving the hills that shall never die, and the waters that shall never cease to flow, trumpet-tongues that for all ages shall speak the poet's name—making them by his genius the monuments of his own glory—lotteries Mausoleums too than man can pile together,—and as everlasting as earth itself. The pyramids of Egypt are no such monuments as Langdale Pikes,—and as long as they stand, Wordsworth's name will dwell with them, and thus long the traveller will view them with an interest, that the scenery itself wild as it is, can never create.—Wordsworth showed us all, and wandered with us some three or four miles more. He took us to the grounds of Captain Hamilton (of men and manners memory, whose book by the way has done us infinite mischief in England, for all the intelligent people look upon him as a man of talent and character, while Mrs. Trollope's is every where viewed as an amusing caricature)—and, as he was not now at home, he showed his house and grounds. His house is on but a narrow piece of ground,—and yet the ground has been so laid out, with such a seizure of prospect, and such an improvement even of the ledge of rocks near which it is, that it is made a charming spot. I do not know but that this turning of ill to good, is one of the finest achievements of English taste, I have ever seen. Even the little cliff is made an ornament.—The water-view in front is fine. And then the flowers and shrubbery, they so adorn the house as to make it seem a fairy bower. But Lady——, somebody whom Hamilton is to marry, or has married, will remove him from this, to a larger place, where more friends can be accommodated. Mr. Wordsworth next escorted us over the grounds of Lady Is Fleming—Rydal Hall, as it is called. "To have an idea, said he, of the manner in which property is preserved under our laws, and in a single family, you must remember that this estate has been in the family (of Norman descent,) ever since the days of Henry VI." I remember by the way, a good discussing this law of Primogeniture, with an Englishman in London, who, at least gave me a new, if not a good argument in its behalf. "Our law, said he, makes but one poor devil in the family, the eldest son—yours make many, for it throws wealth into the hands of all. The younger sons with us must look out for themselves. Yours are looked out for!" Mr. Wordsworth pointed out to us a beautiful cascade on the estate of Rydal Hall, near which was built a rustic seat to give a front view,—and then from these garden scenes, we began a ramble over the rougher hills. The poet took his umbrella, for here there is a shower every other hour,—and though he was obliged to handle this, and watch his straw hat that the wind played roughly with, yet, sixty-five years old, as he told us he was, he would clamber up and down the cliffs, with as sprightly a foot as we could. He guided us to Loughrigg Mount, where we had a view of the Grasmere Lake, and clambering over a wall, where the poet lost his hat, for which we had a race,—and then sitting on the brow of the mount, we had a view of a little paradise below—mountains all around, a little lake—with a narrow valley highly cultivated—flocks grazing on the brows of the hills—a church in the distance—the village of Grasmere,—a well made road winding around the water—nature and labor doing so much—indeed it is one of the most beautiful views I ever had of such a character! On we went, then, to yet wilder spots, till we came to a lone house amid the hills, where poverty plainly dwelt, which Wordsworth

entering, brought the good woman to the door, whom he addressed in almost another language, (the Cumberland dialect) and after inquiring about her health and that of her family in the kindest and most familiar manner, solicited for us the guide of her son. This was yet the best display of Wordsworth's character I had seen, so much of simplicity was there—so free from ostentation—such a benevolence,—and then so much of respect and affection from the old woman, to one who had evidently done her a thousand generous services. I shall always love the man and his poetry the better for such a scene. While the guide was adjusting his dress, we sat down upon some rocks, and Wordsworth pointed out the scene of his "Excursion," and some of his minor poems. He then dwelt upon the critics who had assailed him in his early life, and made his poetry unpopular. They may have affected my fortunes, he said, and thus my enjoyments and my means of doing good,—but they have never wounded my feelings—for I never wrote for popular applause,—I felt that the time would come, when justice would be done,—and now I have that justice—now when the reward is most sweet, as I am about to end my days. "I have it in such an interest as you and others like you, just beginning life, and from the most distant parts of the world, have expressed in my behalf." Indeed he has. His morn was dark and cloudy.—The noon of his life had none of the midday light. But his sun is setting in one unbroken stream of lustre. All are awarding him praise. Tardy justice has come at last, with triple honors. Even the sole and proud position of Milton is in danger. But I believe all this is but the beginning of his fame, for his is a school that stands the test of time, the school of Nature.

Our guide having at length arrived, Wordsworth marked out our route on a slip of paper, with all the views of interest for miles, over all of which he had wandered, and which he had studied for years and years. I could not avoid expressing warmly a wish that he could visit America, and there find a wilderness of scenery worthy of such a pen,—immortalizing our mountains and our vales, as he had those of his own home. "I shall never see America," he said.—"I might if I were younger—but I shall never cease to have an interest in all its history." I took out my pen, ink and paper, and asked for his autograph. "Langdale Pikes in front of us. June 20th, 1835," with "Mr. Wordsworth," was on mine, and "Vive, valeque" on that of my friend. I bade him adieu with tears in my eyes. How painful it is to part thus forever from such a man!

In these details of an interview with Mr. Wordsworth, I hope my friends will not think that I violate any of the civilities of life by a publication. I feel that I have done nothing of which he would complain, occupying the position in the world that he does, and this must be my acquittal; for of all unpleasant offices, that of reporting a private conversation upon matters where secrecy is tacitly expected, I should avoid the quickest. It is ever dangerous ground to tread I know, and a great discrimination is to be used. And he who expects such kindness from many literary Englishmen, professing no more liberality toward the American government than Wordsworth's political principles can allow him to have, will expect in vain. Beware, I tell my countrymen, of wasting admiration upon certain men, radicals though they be, and great admirers though, of radicalism on paper, but aristocrats and fops in fact. A courtier of the mob here, on paper, is often a Lord-hunter in person. I have been told—I do not know, for I have not seen him but in his seat in the House of Commons, and do not wish to see him elsewhere, after what I have heard—that a certain novelist, whose talent and whose power, all Americans show their taste in extolling high, is but the person whom I have described, and that the incense we burn at his altar, is but stuffed at, as the offering of some brute beast. As a fact, it is stated, that the kindness which is shown to Americans by Sir Robert Peel, whose political prospects depend upon stopping the progress of American principles, is much more remarkable than that of the radical who writes so much in their favor.

[From *Mephistophiles in England*.]

TAGLIONI.—Between the acts the curtain rose for a divertimento in which the incomparable Taglioni made her appearance. She was greeted with the loudest demonstrations of popularity from

her numerous patrons, which she acknowledged by several graceful courtesies.

"Behold!" said Mephistophiles, directing my attention to the evolutions of the dancer, "the progress of civilization. If all this were not so graceful, it would be indecent: and that such an exhibition has a moral tendency, is more than doubtful. Look at that young girl in the pit! she has seen sufficient to crimson her face, neck, and shoulders, with a blush of shame; and she hides her head from a sight which has shocked her sense of decency. There is no affectation there. She is an innocent girl, fresh from the country, who never saw a ballet in her life. Yet all the rest, man woman and child, gaze on delighted. Every glass is raised, the more closely to watch the motions of the figurante. Look! she makes a succession of vaults; and her scanty drapery, flying above her hips, discloses to her enraptured admirers the beauty of her limbs. A thousand hands beat each other in approbation. Now she pirouettes, and observe the tumult of applause which follows. See! she stands on her left foot on the point of her great toe nail, extending her right leg till the top of her foot is in a parallel line with the crown of her head. In this position she bends, with an appearance of the greatest ease, till her body nearly touches the ground; and then gradually rises, with the same infinite grace, amid enthusiastic bravos and ecstatic applause. Now on her tip toe, her right leg still extended, she moves slowly round, liberally extending to all her patrons in sight the most favorable opportunity of scrutinizing the graces of her figure, while the whole household testify their infinite gratification at the sight by every species of applause. Again she comes from the back of the stage, turning round and round with the speed of a tetotum, but with an indescribable and fascinating grace that seems to turn the head of every young man in the theatre. During the storm of approbation which ensues, she stands near the footlights, smiling, courtesying, and looking as modest as an angel. Then comes Perrot, who is as much the idol of the ladies as Taglioni is the goddess of the gentlemen. He leaps about as if his feet were made of India rubber, and spins round as if he intended to bore a hole with his toe in the floor of the stage. Then a little pantomime love business takes place between the danseur and the danseuse: they twirl away, and glide along, and hold eloquent discourse with their pliant limbs; and the affair ends by the gentleman clasping the lady round her delicate waist, whilst he, bending his body in the most graceful attitude, so that his head shall come under her left arm, looks up in apparent ecstacy into her smiling face, as the lady, raised high above him on the extreme point of her left foot, extends her right limb at right angles with her body, and looks down admiringly upon her companion. Thus grouped the curtain drops, and every one cries 'bravo,' thumps the floor with his stick, or beats his palms together, till such a din is raised as is absolutely deafening."

"She is a charming dancer," I observed.

"Yes!" replied he, "she understands the philosophy of her art better than any of her contemporaries: it is to throw around sensuality such a coloring of refinement as will divest it of its grossness. For this she is paid a hundred pounds a night, and is allowed two benefits in the season, which generally averages a thousand pounds each. While you are thus liberal to a dancer, some of the worthiest of your ministers of religion receive about fifty pounds per annum, for wearing out their lives for the good of your souls; and many of your most exalted men of genius are left to starve. Such is the consistency of human nature!"

**INFLUENCE OF PROFESSION ON MORTALITY.**—There are some curious facts respecting the influence of professions on mortality, collected by Dr. Casper, of Berlin, from which it appears that "head work is more injurious than bodily labor; but that the combination of the two is the most wearing.—A sedentary life, free from all excesses, is on the contrary, the condition most favorable to life." Of all professions, that of a physician, according to Dr. Casper, is the most life-wearing; while that of the divine occupies the other extreme of the scale. Of 100 divines, 42 reached 70 years of age and upward—of 100 physicians, 24 only attained to that age. Of 1000 deaths, between the ages of 23 and 62 inclusive, the years of greatest professional activity, there were—of physicians, 610—of divines, 345.

**AVERAGE DURATION OF LIFE.**—Upon the value of the average duration of life, in determining

the relative prosperity of nations, M. Quetelet has some excellent remarks: "It may be said, that nation is increasing in prosperity when it produces fewer citizens, but preserves them longer. This condition is entirely to the advantage of the population; for if the numbers born are smaller, the useful subjects are more abundant, and generations are not so frequently renewed, to the injury of the state. Man, in his early years, lives at the expense of society. He contracts a debt, to be repaid at a future day; and if he does not live to discharge it, his existence has been a burden to his country. To estimate this expense, it is sufficient to state, that a child, from its birth, till it attains to twelve or sixteen years, costs, in the hospitals of the Low Countries, 1,110 francs; say, however, only 1,000 francs. Every individual, then, who survives infancy, contracts a sort of debt, which cannot, at least, be less than 1000 francs—the sum thus paid by society for each infant, when abandoned to its charity. In France the annual births amount to 960,000, of which, 9-30ths die before attaining to a serviceable maturity. These 430,000 unfortunates may be considered as so many strangers, who, without fortune or industry, take a part in the general consumption, and depart without leaving any other trace of their passage, save eternal regret.—The expense of their maintenance, without reckoning the time they have pre-occupied, represents the enormous sum of 432 millions of francs. If we consider, on the other hand, the grief that such losses must occasion, which no human sacrifice can compensate, it will be perceived how important a subject they afford to the consideration of the legislator and philosopher. It cannot be too often repeated, that the prosperity of States consists less in the multiplication than in the preservation of their component numbers." This reflection gives a new item in the long account between mankind and their governors, on the score of useless wars, by which so many are cut off at a moment of their incipient utility, and the greatest possible waste is occasioned of the national resources.

**THE MOVING PLANT.**—The following interesting notice of the Moving Plant appears in No. 122 of Maund's Botanic Garden, a work replete with information on such subjects: "This plant was, formerly, called *Hedysarum gyrans*; and the peculiar property of continual motion which its ternate leaves possess has interested naturalists ever since it was noticed by the younger Linnaeus. In a letter to his friend Mutis, he says, 'I have raised a very wonderful plant this year in my garden. It is a new species of *Hedysarum* from Bengal. This plant has a spontaneous motion in its foliage, which seems almost voluntary. You are aware that various parts of the vegetable body, especially those subservient to impregnation, can be so stimulated by the touch as to exhibit some kind of movement. You know also the motions of some kinds of *Mimosa* and *Oxalis*, as well as of the *Dionea muscipula*, arising from the touch of any extraneous body, or from agitation of the wind. But the plant in question is not affected by either of these causes. Whether in the open air or in a close room, it spontaneously moves its leaflets, now one way, now another, one, two, or more at a time; not all at once, nor all in one direction; and this takes place whether the air be serene or rainy. It has not yet flowered, but I expect that event in the course of the autumn. The plant requires great heat.' Instances of incomprehensible action like this can but awaken the attention of the most apathetic.—We will give a figure and particulars of this plant in the fifth page of the Florist Register. The irritability of such plants is better known, especially that of *mimosa pudica*, or humble plant, whose leaves shrink from the touch, the culture of which may be recommended to the curious amongst our young friends. Seeds are easily obtained, and an efficient hot bed during summer, in which the plants should be constantly kept, will sufficiently mature them for the purpose of showing their sensitive peculiarities. This is a property which advances the vegetable towards the animal kingdom, just as instinct advances the brute towards the human species.

**THE RIVER.**—On last Friday night it commenced raining, and has continued to rain; with occasional intermissions, from that time to the present. The river has in consequence risen considerably; there is now water enough for middle sized boats, and the river is still rising. The Tempest, a handsome new boat, departed this morning, and several

other boats are taking in freight.—[Pittsburg Gaz. of 21st.]

**WHEELING, Sep. 1.**—It rained through the whole of Saturday. The river will doubtless rise to-day or to-morrow and continue navigable for steamboats until closed by ice. The past season has been a remarkable one. The water has not been so low as to prevent the departure of steamboats down the river daily, and there have been but eight or ten days in which they could not ascend to Pittsburg. One class of our enterprising navigators has been greatly disappointed, and consequently suffered much loss—we mean the owners of keelboats. The year may be said to have been lost to them—like the farmers, who from the operation of contrary causes, lose a crop by the suspension of the rains.

**CHOLERA.**—The last Milan (Huron county, Ohio) Times mentions, that no other cases of Cholera had occurred in that vicinity subsequent to those stated to have taken place in the family of Anson Merry, a few weeks since.

**HEALTH OF NEW ORLEANS.**—The True American of the 10th instant, states that the number of deaths in N. Orleans during the previous week, had amounted to about one-third more than the usual number. The increased mortality was attributed to the hot weather of that week. The temperature had become more agreeably at that date,—there having been a refreshing shower of rain on the day before—and it was expected the city would regain its accustomed degree of health.

The Boston papers, of yesterday, announce the demise of the venerable Jacob Kuhn, at the age of more than four score years, more extensively known, perhaps, than any other individual in New England, from the office he held. Mr. K. was chosen under the colonial government, messenger, or sergeant-at-arms, to the House of Representatives in Massachusetts, which he held for more than half a century, and like his prototypes William Cooper, town clerk of Boston, and Abraham Newland, cashier of the bank of England, was never absent a day from his official duties, during that long period of time, each considering his respective avocation paramount to every pleasure or other pursuit in life. No better proof of his integrity and talents can be adduced than that he was annually re-elected without opposition, amidst party strife and political calms, never having an opponent.

**IMPORTANT NOTICE.**—Section 5.—No auctioneer on the same day and at the same place where his public auction shall be held, nor any other person, at the same time and place, shall sell at private sale any goods liable to auction duties, under penalty of forfeiting their price.—[Vide Auction Laws S. N. Y.]

**THE BANK OF THE U. S.** is closing up its concerns, as speedily we presume, as comports with public convenience, and that of the debtors of the Bank. We find in the Boston Atlas the following statement:

The Bank has twenty-five branches. Eight of them are sold, or nearly wound up. These sales have been effected at one, two, three and four years' credit. In two instances the instalments have extended to five years. Two other branches will be sold, probably, in a few days. A negotiation for them is in progress. The eight branches above alluded to, are Portsmouth, Hartford, Utica, Buffalo, Louisville, Lexington, Charleston, and Baltimore. The two under negotiation, are Fayetteville and Nashville.

**BANK OF MASSILLON.**—At a meeting of the Board of Directors of the Bank of Massillon, on the 5th inst., Parker Handy, Esq. was elected Cashier, and A. G. Hammond, Esq. appointed Teller, in the room of J. D. W. and T. J. Calder, Esqs. resigned.

The number of inhabitants in the territory of Arkansas, with the exception of two counties, which have not yet been heard from, is 51,809.

**ATROCIOUS ROBBERY BY A LANDLORD.**—We learn by the Kingston (U. C.) Gazette, that a most infamous crime was perpetrated in that city, the week before last, by William Carroll, keeper of the Canal Coffee House. The sufferer is a Mr. Wilson, an English gentleman, who arrived at Quebec, in July last, in the Mary, from London, and whose object in visiting this country was to purchase lands. On arriving at Kingston, Mr. Wilson took up his abode at Carroll's and entrusted to him, for

safe keeping, a heavy square box, covered with matting and corded. The box contained Spanish dollars, and must have been worth at least \$800.—The wretch, Carroll, took advantage of the absence of Mr. Wilson, who had gone to Toronto on business, and on Wednesday evening, the 24th ult., he suddenly disappeared, carrying the box with him. It is said that he is gone to the United States by the way of Oswego.

**AN ALTERNATIVE TO BE THOUGHT OF.**—At the Anniversary Dinner of the public Schools in Boston, on Wednesday, the following toast was given by Edward Everett:

**Education.**—A better safeguard for Liberty than a standing army. If we retrench the wages of the schoolmaster, we must raise the wages of the recruiting Sergeant.

[From the Evening Post.]  
(In imitation of the Ode in the 8d Canto of Don Juan, beginning with "The Isles of Greece! the Isles of Greece!")

MY NATIVE LAND.

I.  
My native land! My native land!  
A land with every gift replete,  
All perfect from its Maker's hand,  
An Empire's glorious seat!  
And far removed from thrones and slaves,  
There freedom's banner proudly waves.

II.  
The frigid and the torrid clime,  
The temperate and the genial beam,  
The vale, the mountain top sublime,  
The arid plain, the swelling stream,  
There linked in Union's golden chain,  
Bear witness to her vast domain.

III.  
Her mountains look o'er realms serene,  
O'er waving fields and cities free;  
And mightier rivers roll between,  
And bear her wealth from sea to sea;  
While o'er old ocean's farthest deep  
Her banner'd navies proudly sweep.

IV.  
On Plymouth's Rock the Pilgrim lands,  
His comrades few, and faint with toil;  
While warring tribes in countless bands,  
Roam lawless o'er the uncultured soil.  
A few brief years have rolled away,  
And those dark warriors—where are they?

V.  
And where are those, th' heroic few,  
That landed on that rocky shore?  
Their voice still rings—their spirit too  
Still breathes—and will forever more!  
For in their sons still burn those fires  
That freedom kindled in their sires.

VI.  
'Tis something—though it be not fame—  
To know we spring from noble race,  
To feel no secret blush of shame  
For those we love, suffice our face.  
Then let us to our sons transmit  
A land and name unsullied yet.

VII.  
To us was left in sacred trust,  
A realm redeem'd, a glorious name,  
The ashes of the brave and just,  
Fair freedom and immortal fame!  
And in our hearts the spirit dwells  
Which power defies, and force repels.

VIII.  
We've not to weep o'er glory fled—  
We've not to brood o'er servile woe—  
We call not on the illustrious dead  
To shield us from a living foe;  
And should our pride be o'erthrown,  
'T will be by native swords alone.

IX.  
The standard which our sires unfurled,  
And which through peril's path they bore,  
Still floats o'er half the western world—  
Still waves on many a distant shore—  
And long shall wave, triumphant, free,  
O'er dome and tower, o'er land and sea!

PARTNER WANTED.

Wanted, a partner in an extensive Printing Establishment. No one need apply who is not a thoroughbred printer, competent to superintend and direct an office in which upwards of 30 persons are employed, and able to furnish \$3000 cash capital. The best of references will be given and required. Letters, with real name, may be addressed to P. P. P., Post Office, New-York, postage paid, and they will be promptly attended to. May-4

TO TUNNEL CONTRACTORS.

Proposals will be received by mail, or otherwise, for excavating a Tunnel on the summit of the Sandy and Beaver Canal. The Tunnel is 900 yards long, the material to be removed is a soft sand-stone rock, the highest part of the ridge through which it passes is about 30 feet above the top of the Tunnel. As the deep cuts at the termination are not excavated, most of the material will have to be removed through shafts. Proposals must be accompanied with good recommendations, as to skill and competency.

E. H. GILL,  
Engineer.

New-Lisbon, Ohio, Sept. 17, 1845.

## LOCK GATES, FOR CANALS.

DAVID WILKINSON, of Oshon, Albany county, State of New-York, have obtained Letters Patent for the United States for an improvement in Lock Gates, &c., in view of the invention of engineers and constructors to his invention, the result of thirty years' practical experience. The chief feature of his invention is the self-adjusting valve gate, which is opened in a great degree by the reason of the water, and is closed by the weight of the valve gate, rods and screws, and kept secure and close by a pull, the improvement requiring very little force, in aid of the power of the water, to raise the valve gate. The Lock Gate is kept perfectly tight, or free from seepage, by the method of adjusting the self-friction roller upon the quadrant or circular railway. By means of a thumb on the capstan, the chain for moving the gate can never become tangled or ride on the capstan, and by means of a pull in the hand of the capstan, it can never be turned the wrong way, thus effectually guarding against much danger.

There is a lock in operation at Hightstown, New-York, where the experiment has been fully tested, to the satisfaction of all scientific men who have viewed it, and which has a self-adjusting valve gate, opening an aperture five feet in length, by 18 inches in width, under a pressure of 24 feet lift.

Having transferred the Letters Patent to Mr. JOHN L. WILKINSON, canal contractor, rights to construct under the same, may be obtained from him by applications addressed to Oshon P. O. Competent workmen to construct the gates and put them into operation, will be supplied, if desirable, either by the inventor or the assignee.

The following letter, from Judge WALKER, of New-York, one of the most experienced engineers in the United States, is conclusive with respect to the character of this gate:

"Monticello, (U. Canada,) Aug. 14, 1835.

"Dear Sir: I have been witness to a trial of a new paddle gate invented by David Wilkinson, Esq., for Locks, to be introduced into the canal. It is 8 feet long, by 18 inches wide, and I am certain it is the best improvement of the kind which has been tried in this country. I think it will not get out of order, and is so simple, that a 15 years' old boy will open it, and there is no danger of throwing persons into the lock, from the operation, as nothing of the kind can happen.

"I think you will be much pleased with it. It applies its own weight to any head which can be used in locks, and is more particularly superior in the plan of the lock, to fill and empty rapidly, so easy as you please.

"I am, very respectfully, dear Sir, your obedient servant,

"BENJ. WRIGHT.

"To Edward F. Gay, Esq.,

"Civil Engineer, Lancaster, Pa."

To which is added the testimonial of J. B. MILLS, Esq., Engineer, who has been associated with the greatest works of internal improvement in the Union.

"Mr. Wilkinson has recently invented a valve for Lock Gates, which is undoubtedly of great value, and readily applied. Mr. W. has the contract for constructing the Lock Gates upon the St. Lawrence Canal, (which is the largest upon this continent,) where it is determined to adopt his valve, and his manner of working the same. Having the utmost confidence in Mr. W.'s valve, having seen it applied, I most confidently connected it to all those interested in the construction of Canal Locks.

"J. B. MILLS,

"Engineer St. Lawrence Canal.

"Corwail, (U. C.), Aug. 21, 1835."

## TO CONTRACTORS FOR EXCAVATION AND

## RAILROAD

PROPOSALS will be received at the Office of the Philadelphia and Reading Rail Road Company, in Philadelphia, on the 19th and 20th days of October next, for the grading and masonry, of about sixteen miles of the Rail Road between Pottsgrove and Northtown.

In this distance, a large amount of heavy work, deserving the attention of skillful and competent Contractors, is to be let. The jobs of most magnitude, are a Tunnel 800 yards long, and a Bridge across the Schuylkill, near Phoenixville.

Plans and profiles of the line, and drawings of the different constructions on it will be exhibited, and all other information in relation to it will be afforded, on application at the Engineer's Office, at Pottsgrove, for ten days previous to the letting.

MONROE ROBINSON, C. E.

Philadelphia, Sept. 2, 1835.

at NewtO19

## RAILROAD IRON.

300 tons of Railroad Iron of the T pattern, just imported and for sale by

BOWLAND & ASPINWALL,

35 South street.

## RAILROAD CASTINGS.

MARY & WARD, Proprietors of the Albany Eagle Air Furnace and Machine Shop, will make to order car wheels, chairs and knees, and every other description of castings required for railroads.

R-1y 5614

## AUBURN AND SYRACUSE RAILROAD.

## NOTICE TO CONTRACTORS.

Sealed Proposals will be received until the 15th day of October next, at noon, by the undersigned, Chief Engineer and Agent of the Auburn and Syracuse Railroad Company, for the Grading, Masonry, and Bridges on said Road. Individuals desiring to construct for the execution of the whole or any part of the work, will be furnished on application at the Office of the Company in Auburn, with blank forms of proposals, and priced specifications.

The contracts will be formed in the usual manner—a specific price being stated for each item of work, which price is to include the cost of material and labor required in rendering the work complete.

The proposals to be accompanied with the names of sureties, and where the parties are unknown to the undersigned or resident Engineers, the usual certificates of character and solvency will be required.

Individuals who have been employed on other works, must furnish satisfactory recommendations from the Engineer or Superintendents of the same. A rigid adherence to the conditions of each contract will in all cases be required.

It is desired that all the work in each section, including Grading, Curvature, and Bridges, should be embraced in the same contract, and it is requested that the proposals be made accordingly.

The plans of the different structures will be ready for examination at the Office aforesaid, by the 1st day of October next.

EDWIN F. JOHNSON,

Chief Engineer & Agent A. & S. R. R. Company.

Auburn, Aug. 25, 1835. 37-1150

## AMES' CELEBRATED SHOVELS,

## SPADES, &amp;c.

300 dozens Ames' back-swing and plain Shovels, 75 do do round-pointed do 100 do do cast steel Shovels and Spades, 100 do do Bucket Shovels and Spades, 100 do do steel plated Spades.

Together with Pick Axes, Churn Drills, and Crow Bars, steel pointed, made from Salisbury refined iron. For sale by his Agents,

WITHERELL, AMES & CO.

3 Liberty street, New-York.

BACEUS, AMES & CO.

3 State street, Albany.

34-yf

## RAILROAD IRON WORK.

Of all kinds, made to order by GODWIN, CLARK & CO., Paterson, New-Jersey.

Car Wheels, Booms, Axles, and Car Springs, made and fitted complete, at short notice, and full price.

Orders addressed to them at Paterson, N. J., or 34 Bond street, N. Y., will meet with immediate attention.

Paterson, Aug. 18, 1835. 36-1y

## STEPHENSON,

Builder of a superior style of Passenger Cars for Railroads.

No. 224 Elizabeth street, near Blacker street,

New-York.

RAILROAD COMPANIES would do well to examine these Cars; a specimen of which may be seen on that part of the New-York and Harlem Railroad now in operation. J26 15

## RAILROAD CAR WHEELS AND BOXES AND OTHER RAILROAD CASTINGS.

AMES' AXLES furnished and fitted to wheels complete at the Jefferson Cotton and Wool Machine Factory and Foundry, Paterson, N. J. All orders addressed to the subscribers at Paterson, or 60 Wall street, New-York, will be promptly attended to.

AMES' CAR SPRINGS.

Also, Flange Tires fitted complete.

At ROGERS, KETCHUM & GROSVENOR

## PATENT RAILROAD, SHIP AND BOAT SPIKES.

THE Troy Iron and Nail Factory keeps constantly for sale a very extensive assortment of Wrought Spikes and Nails, from 2 to 18 inches, manufactured by the subscriber's Patent Machinery, which after five years' successful operation and now almost universal use in the United States (as well as England, where the subscriber obtained a Patent,) are found superior to any ever offered in market.

Railroad Companies may be supplied with Spikes having counter-sunk heads suitable to the holes in iron rails, to any amount and on short notice. Almost all the Railroads now in progress in the United States are furnished with Spikes made at the above named factory—for which purpose they are found invaluable, as their adhesion is more than double any common spikes made by the hammer.

All orders directed to the Agent, Troy, N. Y., will be punctually attended to.

HENRY BURDEN, Agent.

Troy, N. Y. July, 1834. Spikes are kept for sale, at factory prices, by 1. A. J. Townsend, Albany, and the principal Iron Merchants in Albany and Troy; J. I. Brewer, 222 Water street, New-York; A. M. Jones, Philadelphia; T. Janviers, Baltimore; Degrad & Smith, Boston.

P. S.—Railroad Companies would do well to forward their orders as early as practicable, as the subscriber is desirous of extending the manufacturing so as to keep pace with the daily increasing demand for his Spikes.

H. BURDEN.

## TO TUNNEL MINERS, DRILLERS, &amp;c.

Wanted, immediately, 40 Tunnel Miners, (Cornish Men) to be preferred, 50 Drillers, 20 Laborers, and two experienced Mine Blacksmiths, on the New York and Harlem Railroad, about five miles from the City. Liberal wages will be given, and cash payments made every fortnight. Apply at Mr. FOWLER'S, St. John's Hall, Frankfort street, New-York.

JOHN BUTLER, Contractor.

The Albany Argus, Philadelphia U. S. Gazette and Pennsylvania, will please copy this, and send their bills to the Railroad Company, 14 Wall street, New-York. 25-17

## PATENT HAMMERED SHIP, BOAT, AND RAILROAD SPIKES.

Railroad Spikes of every description required, made at the Albany Spike Factory.

Spikes made at the above Factory are recommended to the public as superior to any thing of the kind now in use. Ship and Boat Spikes made full size under the head, so as not to sink water.

Orders may be addressed to Messrs. SEASTUTTS CORNING & CO., Albany, or to THOMAS TURNER, at the Factory, Troy, N. Y. sept. 18-1y

## RAILWAY IRON.

# AMERICAN RAILROAD JOURNAL, AND ADVOCATE OF INTERNAL IMPROVEMENTS.

PUBLISHED WEEKLY, AT No. 38 WALL STREET, NEW-YORK, AT THREE DOLLARS PER ANNUM, PAYABLE IN ADVANCE.

D. K. MINOR, Editor.]

SATURDAY, OCTOBER 10, 1835.

[VOLUME IV.—No. 40.]

## CONTENTS :

Editorial Notice; Railroads; New Paper—"New-Orleans Union".....	625
Report of E. F. Johnson, Esq., on the proposed Ontario and Hudson Steamboat Canal.....	626
The Harlaens Railroad Company; New-York and Erie Railroad Company; Steamboat Launch; Enlargement of the Erie Canal.....	631
Mad River and Lake Erie Railroad; Extract of a Letter; Railroad "Monopolies".....	632
Ohio Steamboats; St. Joseph's, Florida; India Rubber Fabric; The Tobacco Crop; U. S. Branch Bank at Baltimore; Balloon Communication between London and Paris.....	633
Literary Notices, Miscellaneous, Foreign Intelligence, &c. &c.....	634-640

## AMERICAN RAILROAD JOURNAL.

NEW-YORK, OCTOBER 10, 1835.

RAILROAD from the Banks of the Ohio, opposite Cincinnati, to the tide waters of the Carolinas and Georgia.—We have received a pamphlet containing a Report from a committee in relation to this subject—but have not been able, from ill health, to give it, and several other interesting documents, received within the last three weeks, an examination. We shall refer to it again as soon as we are able.

We take the following brief statement from the first number of the New-Orleans "Union," which shows the deep interest felt, and the active measures taking, by New-Orleans, and the State of Louisiana, in the progress of Internal Improvements.

It certainly evinces a wise forecast, and a thorough conviction of the benefits to be derived from such a course of policy—and we have the utmost confidence that their fullest expectations will be more than realized.

RAILROADS.—Three railroad companies were chartered by the last Legislature, whose importance to this city are superior to any other corporate institutions in this state: we allude to the New-Orleans and Nashville Railroads; the Atchafalaya Railroad and Banking Company; and the New-Orleans and Carrollton Railroad and Banking Company. The capital of these three companies amounts to 11 millions of dollars. The Nashville has a capital of

six millions. The Atchafalaya of two millions, and the Carrollton of three millions. We, in common with many of our fellow citizens, were inclined to the belief that the construction of a railroad from this city to Nashville was agitated at too early a day, and that sufficient confidence could not be obtained to procure subscriptions for the capital. But a closer examination of the question has removed all doubts, and the practicability of the work; its immense advantage to the prosperity of New-Orleans, are manifest to all who have enquired into the subject. The best evidence of this change in the public opinion, and what the sentiments of capitalists are as regards this company, is to be drawn from the fact that all the stock has been subscribed for, with the exception of the shares reserved for the other states, and that a premium of nearly two dollars can be readily obtained for one dollar paid in. We have been promised by a person fully acquainted with the transactions of the company to this date, an accurate account of their operations, and the progress made towards the commencement of breaking the ground for this great undertaking; at an early opportunity we shall present the same to our readers.

The Atchafalaya Railroad and Banking Company was chartered to construct a road from a point on the bank of the river Mississippi in the parish of Point Coupee to a point at or near the Court-house in the parish of Saint Landry. This company has already commenced its labors, and we trust that its completion may not be far distant. This road passes over one of the finest cotton regions of our country, and will be the means of bringing into cultivation an immense quantity of valuable lands, besides connecting sections of the country which will be greatly benefited.

The Carrollton Railroad and Banking Company are bound to construct a road from this city to Bayou Sarah, and as the Atchafalaya Railroad will come in nearly opposite to Bayou Sarah, the Carrollton Railroad will form the last link to connect this city directly with the interior of the western part of our state. The immense quantity of cotton received from Bayou Sarah and the intermediate ports—the sugar made along the line of the road—the continual increasing travelling between those places and this city, will render the stock of this company of immense value, independent of the banking privileges which

they possess. On another occasion we shall resume this subject—we make these passing remarks at this time to call the attention of our citizens to the three great works of internal improvement about to be commenced within the limits of our own state.

We have received the first number of a new daily evening paper from New-Orleans, called the *New-Orleans Union*. It is a large, and well filled sheet, and is to be published for the public, and not for a party—like most of the newspapers of the day.

We give the following extracts from the Editor's (Mr. J. F. Carter) introductory address, which it is to be hoped will be rigidly adhered to, and a similar course adopted by others. We bid him "God speed," and send him a file of the Journal for the last year.

... The editor regrets that he cannot comply with the wishes of those who may desire that his paper should have a partisan character. We have already too many political parties and too many political papers. There is a superabundance of patriotic editors under whose over zealous treatment it may happen that our liberties may be endangered.

We want a newspaper which shall serve as a neutral ground for all politicians, and where sentiments of patriotism and of devotion to the happiness and prospects of our common country may be recorded by the friends of any of the aspirants of public favor.

The subject of internal improvements is one which will occupy the special attention of the editor; convinced that railroads and canals form the strong bonds of our union. On this all important subject no inhabitant of New-Orleans or of Louisiana can feel indifferent—situated at the extremity of the United States, we are from our position most interested in the construction of those works which may connect us more closely with the other parts of our country. The immense quantity of valuable lands in this state fit for the culture of the great staple of the south, offers an additional reason to render us zealous in behalf of those railroads, already commenced or projected within the limits of the state.

Requiring an extra outlay of capital, over and above the other route, to make an equally perfect communication of \$2,740,000, or nearly three millions of dollars! This, in the present depressed condition of the finances of the State, when there are so many, and increasing demands upon its treasury for the construction of lateral canals and railroads, is an important item—and assumes still greater importance, when we consider that a resort to taxation has been seriously contemplated, as necessary to supply deficiencies either already existing or anticipated.

There is another view to be taken of this subject—no one can reasonably doubt, that should the Erie Canal be enlarged to Buffalo, the growing trade of Lake Ontario will require the immediate opening of a communication of the same size to connect with that Lake at Oswego. This result will follow with as much certainty as the construction of the present Oswego Canal has already followed that of the Erie Canal. It is impossible, under an enlarged view of the subject, to doubt that the result will be as stated—neither will it be doubted, that the time is not distant, when the State of New-York, (even should the Erie Canal be enlarged to Buffalo,) will find it not only expedient, but necessary, to open a communication, from Lake Erie to Lake Ontario, within her own borders. This will be done by the State, if she is not anticipated, (which is not improbable, should there be a much longer delay,) by the opening of a similar channel, through private means. I present this view of the subject, to show that nothing will in reality be hazarded, while the probability is that much may be saved, by opening at the present time the Ontario route.

The question, of the relative cost of transportation, which I now propose to investigate, is one of some difficulty, not so much so, however, but that it can be satisfactorily determined, within certain limits.

The view which, in my report, I took of this subject, was based principally, as therein stated, upon "a printed tariff of prices, established by companies engaged in transportation for the year 1834; and since the reduction of tolls," by these prices, a great difference was shown in favour of navigation by wind and steam, upon the larger waters, compared with a canal. These being the rates publicly advertised, it was presumed they were such as could be relied upon, for a safe business, and although, perhaps, exceeding the cost at which particular articles were conveyed in many instances, they were still accurate in the most important point, in affording a correct relative view of the cost by the different mediums of communication. There has been the present year, as I understand, some reduction, not, however, affecting very materially the relative of the prices as exhibited in the last year's tariff.

In the document under consideration, there is a statement of cost of transportation *exclusive of tolls* upon the canal, obtained partly from the tariff of 1834, partly from a "recent tariff," and for the heavy freight one article only is mentioned, viz. flour, and the authority not given. Flour is estimated as being near the average of all the freight, and assumed as such. It is rated exclusive of tolls at 8.9 mills per ton per mile on canal, and on the Hudson River by steam tow-boats, it is 8 mills. The rate for merchandize is 21.5 mills per ton per mile on the canal, and on the Hudson River by steam tow-boats 15.1 mills. There are few articles that are transported in boats at a less rate than flour, and as merchandize is so much higher, there is reason to believe that the price for flour is below the average. The general rates for heavy goods, by the recent tariff, are omitted, and this is to be regretted, as they are the most important for our purpose.

In the document referred to, a comparison is instituted between the cost of transportation, on the two routes from Buffalo to Albany, as follows:

#### By Schooners—

Buffalo to Lewiston, 30 miles, canal, at 15½ mills, -	\$0 46½
Lewiston to Oswego, 146 miles, lake, at 10.9 mills, -	59
Oswego to Albany, 202 miles, canal, at 15½ mills, -	3 13

#### By Canal Boat—

Buffalo to Albany, 363 miles, canal, at 11 mills, -	\$5 16½
Transshipment at Buffalo, -	3 99
	25
	\$4 24

Difference in favour of Erie Canal route, - - - 94

The above comparison is faulty, because,  
1st, The cost of transportation on the canal, exclusive of toll, is rated too low.

2d, Too great a reduction is anticipated, in the future tolls upon the canal.

3dly, The rates per schooner on the canal and lake are too high.

4thly, The extent of canal between Buffalo and Lewiston is 9 miles instead of 30.

Assuming flour to be, as stated in the "document," at 8.9 mills per ton per mile, exclusive of tolls, the average of the transportation upon the canal cannot be safely rated at less than 11 mills. It is supposed in the document that about 40 per cent. will be saved on the enlarged canal. The reasons for this, so far as they are given in the document appended to the report of the Canal Committee, are not satisfactory, since all the circumstances, which have a practical bearing upon the case, seem not to have been considered. The principal advantage contemplated from the enlargement of the canal, is not so much a saving in the cost of navigating, as the increase, it will give to its capacity.—The necessity of making further provisions for the increase in trade, may be considered the chief object of, and to have alone dictated, the proposed improvements.

Instead of 40 per cent., from 25 to 30 is the most that can safely be relied upon as likely to be saved, on the large canal, making the cost per ton per mile 8 mills. More may indeed be saved, but in a work of so great magnitude, involving so large an expenditure, it would not be prudent to anticipate a greater reduction.

In relation to the tolls, the estimate in the document is made on the supposition of a reduction of 50 per cent., one half the present rates. The tolls as they now stand will rather exceed 1 cent per ton per mile, viz.

For flour 9 mills, -	constitutional limit, 8.92 mills.
Do. Merchandize 18 mills, -	do. - - - 17.84 mills.

Ten mills per ton per mile will rather fall short than exceed a fair average. That this will be materially reduced, is, to say the least, extremely doubtful. In the first place, the tolls as exhibited above are now down to within a very small fraction of the constitutional limit. A farther reduction will hardly be required, for securing the western trade, particularly if as great a saving is made, as is anticipated, in the cost of transportation on the enlarged canal. And should the State conclude to expend nine millions of dollars in enlarging the Erie Canal from Albany to Buffalo—another million to connect with Lake Ontario—another for the Niagara Canal—another for the Black River Canal—two millions for the Rochester and Olean Canal—two more to complete the Chenango Canal, with a fourth of a million annually to keep the three last in navigable order, together with whatever shall be required, for the various other projects in embryo, and she will hardly be able to make any material reduction in tolls for some time to come.

Considering all the various demands that are likely to be made upon the treasury, the State will scarcely be disposed to make any farther reduction, unless absolutely required for the security of trade, which is not probable—any calculations, therefore, which are founded on such anticipated reductions, cannot, and, in an improvement of so great magnitude as the one proposed, ought not, to be relied upon. Indeed, as already stated, the tolls are now down to the constitutional limit, and cannot be farther reduced, but by an appeal to the people, and such an appeal, made under a threat of taxation, can never succeed.

The allowance proper to be made, therefore, for the cost per ton per mile upon the canal, is for transportation, exclusive of tolls, - - - 8 mills.  
For tolls, - - - 10 mills.

Total, - - - 18 do.

The cost by the Erie Canal, as enlarged to the size proposed, will therefore be as follows—

Buffalo to Albany, 363 miles, canal, at 18 mills, -	\$6 54
Transshipment, at Buffalo, same as given in the document, -	25
	\$6 79

To present the comparison in the fairest manner, by making the two cases as nearly parallel as possible, I will suppose that schooners are employed from Lake Erie to Oswego, and that a transshipment takes place at Oswego; the conveyance from thence to Albany, being by canal boat, the same as from Buffalo to Albany. It is stated in the document, "that Mr. Johnson, in his report, provides for a larger vessel than can pass the locks on the Welland Canal. We presume that a link in so important a chain of navigation would not be left in the control of neighbors, who are proverbial for taking care of themselves; we, therefore, proceed on the presumption, that a canal for lake vessels will probably be required from somewhere near Buffalo or Black Rock to Lewiston, in order to perfect the scheme." To show the necessity for so much presumption, I will quote what I did say, as follows: "My views of this, (the Ontario route,) are in a great measure predicated upon the supposition of a more complete communication than now exists between Lakes Erie and Ontario. It is only by a work of this description, formed within our own bor-

ders, that the full benefit of the Ontario route can be attained," and I alluded, likewise, to the Welland Canal, and to the unfavorable circumstance "of that work being within the territory and under the control of a foreign power."

As it regards the policy and economy of opening a communication between Lakes Erie and Ontario, suited to lake vessels, and particularly schooners, and the practicability of conducting the trade of the upper lakes to Oswego, through such a channel, there can be no doubt. This fact is distinctly stated in the document under consideration, as follows: "from Buffalo to Lewiston, (alluding to the Niagara Canal,) there can be no doubt of the superiority of a navigation by schooners." The cost per ton per mile by schooners, as assumed in the document, is believed to be, for a general traffic, much too high. It is rated at 10.9 mills per ton per mile. On the Hudson River, by steam tow boats, it is given at 8 mills. In the report of the Canal Board it is stated, that "the charges by steam tow boats are higher than in sloops," and reasons are assigned for the difference. It will not be improper, therefore, to suppose that the charges on the Hudson River, by sloops or schooners, are less than 8 mills per ton per mile.

Allowing the Ontario route to be a general medium of communication, and possessing the same advantages, as it regards amount of business and competition, as exists upon the Hudson River, it is difficult to perceive why the charge for schooners, on that lake, which is given in the document at 10.9 mills, need be much greater than upon the river. The risk and insurance will, perhaps, be more on the lake; but on the other hand, there will be less delay and detention by contrary winds and calms than upon the river. This view of the subject is, however, too limited. It must be considered that the main object to be attained, is the accommodation of the trade of the upper lakes. The vessels, therefore, which deposit their cargoes at Oswego, will be freighted at the ports west of Buffalo. Say at Cleveland, Detroit, Chicago, and intermediate places. The reduction in price per ton per mile, on lengthened voyages, is very great. This principle was particularly illustrated in my report of the Ontario and Hudson Canal. The distance on the Hudson River, between New-York and Albany, is only 145 miles; from Oswego to Buffalo it is 176 miles; to Cleveland 350 miles; to Detroit 420 miles; to Chicago 1170 miles.

The total charge for transportation, as per tariff of 1834, is the same from Buffalo to any port on Lake Erie, between Erie and Detroit. The difference of distance between these places is 176 miles, the same as from Oswego to Buffalo. The total charge is, likewise, the same from Buffalo to any port on Lake Michigan, embracing a range of 300 miles, being 120 miles greater than from Oswego to Buffalo. So far, therefore, as it regards the trade of the immense region of country west of the port of Erie, there would be little impropriety in considering the total charge for transportation the same, whether the cargoes are delivered at Buffalo or Oswego, if we except the cost of passing the Niagara Canal. In the estimate above quoted, as given in the document, an allowance is made for this last item; and hence the other charge for schooner transportation, from Buffalo to Oswego, should, as it regards the trade west of Erie, have either been stricken out, or very much reduced. This is the proper view of the subject, and being of so much importance, it is rather remarkable that it should have been entirely overlooked.

Although fully justified, from the principles above stated, in omitting the charge by schooner from Buffalo to Oswego, I will rate it at 4 mills per ton per mile.† The cost for transportation by the Ontario route, will then stand thus:

Niagara Canal—9 miles, at 20 mills, -	\$0.18
Niagara river, and Lake Ontario, 166 miles, at 4 mills, -	.66
Transshipment at Oswego same as before, -	.25
Oswego to Albany, 202 miles, at 18 mills, -	3.64
	<hr/> \$4.73

From Buffalo to Albany, by the Erie Canal, as enlarged, the cost, as above found, is - 6.79

Difference in favor of the Ontario route, - \$2.06

Making the cost by the Erie route 50 per cent. greater.

Putting the tolls at 5 mills, as assumed in the document, the charge on the canal will be 13 mills instead of 18, and there will

† Since writing the preceding I have been presented with the following, from a source entitled to credit.

Recent charges from Oswego to Detroit, for salt per ton per mile	4 1/2 mills.
" " do. Lewiston, do. " "	6 "
" " Detroit to Oswego, wheat " "	9.9 "
" " Oswego to Cleveland, merchandise, including warehouse charges at Oswego, " "	114 "

The above prices include all expenses of passing the Welland Canal. I am likewise informed that the charge upon salt per ton per mile, from Oswego to Chicago, is but a fraction over 2 mills.

still be a saving on the Ontario route of 30 per cent., as follows:

Niagara Canal, 9 miles, at 20 mills, -	\$0.18
Niagara river and Lake Ontario, 166 miles, at 4 mills, -	.66
Transshipment at Oswego same as before, -	.25
Oswego to Albany, 202 miles, at 18 mills, -	2.63
	<hr/> \$3.72

Buffalo to Albany, Erie Canal, 363 miles, at 13 mills, - \$4.72

Transshipment at Buffalo same as above, - .25

---

\$4.97

Difference in favor of the Ontario route, - \$1.25

If the rate per schooners on Lake Ontario is doubled, there will still be a difference of 59 cents per ton in favor of the Ontario route.\*

The question as it regards navigating the canal by schooners and steamboats, it will be perceived is of little importance in the choice of routes. The advocates of the Ontario and Hudson Canal have never, as I am aware, contemplated an *exclusive* navigation either by schooners or steamboats. In this light the subject was distinctly presented in my report. They were anxious that the canal should be large enough to accommodate vessels of that class, leaving it to those engaged in transportation to find out and adopt the cheapest method.

If the communication is opened by the way of Lake Ontario, the trade from that Lake will be accommodated in connection with that from Lake Erie and the country west. This very important consideration is overlooked in the document. The importance likewise of being in a situation to avail ourselves of the contemplated improvements between Lakes Ontario and Huron, is likewise overlooked. The advantages to be derived by the interior of the State from an enlarged navigation, suited to steamboats, to be effected by the improvement of Seneca River, and extending to the Onondaga, Cayuga, and Seneca Lakes, is in like manner overlooked. Not a word is said of the great difficulty, not to say impossibility, of enlarging the Erie Canal, to the size proposed, without seriously obstructing the navigation, and nothing is said of the advantages offered by the Ontario route in obviating this difficulty, and of the benefits to be derived from the competition, that will naturally result in the transportation on the two routes. Not a word is said as to the great difference in cost, nearly three millions, which is shown to exist in favor of the Ontario route.

It is seldom that a project for a work of internal improvement, however visionary, is destitute of some redeeming features. In the present instance, not a single consideration is adduced by the authors of the document, in favor of the Ontario route. In their estimation there is every thing to condemn, and nothing to approve. That it has some favorable points, I believe I have substantially proved.

A more complete view of the subject in all its bearings, than I have been able to take, with the limited time and means at command, would perhaps exhibit it in a somewhat different light. I believe, however, that I have said enough to produce conviction of the little reliance that can safely be placed upon the opinions and statements contained in the document. The subject is one of great magnitude, and as such demands a candid and thorough investigation.

I might here close my remarks, in full confidence that I have said enough to convince the public, that the Ontario route possesses advantages, which should have entitled it to a more serious consideration than is bestowed upon it in the document of Messrs. Jervis, Hutchinson and Mills. I cannot, however, in justice to myself, avoid noticing a few of the more glaring errors, and misrepresentations, with which that "document" abounds.

On page 10th, is the following: "Mr. Johnson, after stating that experiments in navigating small canals by steam had hitherto failed, seems to think that it can be successful on large canals." By recurring to page 56 of my Report, it will be seen that I expressed myself as follows: "The experiments which have hitherto been made for navigating the *smaller* canals by steam, have invariably failed. It would seem, therefore, that if this great and growing power in the arts, can be applied at all to artificial navigation, it must be on canals of a *large* size." It will be noticed that, what is *conditionally* expressed on my part, is represented as a *positive* declaration.

\* There is another view of the subject, which I have not time or space fully to illustrate. It is an important one, and I mention it because it is omitted in the document. It is that of a comparison in the cost of transportation under a reduced rate of speed from Oswego to Albany, say 2 miles per hour, with the extra cost of conveyance by steamboats upon the Lake, (should the latter be found in excess,) the greater celerity of motion upon the Lake being such as to make up for the deficiency upon the canal, thereby causing a saving perhaps in both time and expense upon the Ontario route.

In expressing my opinion on the use of steam, I was very careful not to excite any undue expectations. The portions of the canal, on which I supposed it might be used to advantage, were distinctly pointed out: they were the two level portions between Utica and Oswego, embracing a distance of nearly 70 miles, more than half of which distance is natural navigation. Notwithstanding this, it is asserted that "the phraseology was such as to leave the preference of the Engineer involved in some degree of ambiguity."

On page 54 of my Report, the average maximum rate of motion, from Oswego to Albany, is estimated at  $5\frac{1}{2}$  miles per hour. One third, at least, of the whole distance is natural navigation, viz., through the Oneida Lake, and along Fish Creek, and Oneida and Oswego Rivers. How much more may be obtained on the Mohawk and Hudson Rivers, it is impossible to say. The greater velocity will take place on this portion, leaving the rate of motion on the remaining portion only four and a half miles per hour. This is given on the supposition that the whole distance from Buffalo to Albany, is passed under the most favorable circumstances in 62 hours, being less than the time occupied on the Erie Canal route, by 83 hours. I farther state that "this is probably a greater difference than would be proper to assume," and I add, "that if the average is taken of sail-vessels and steamboats upon the lake, with steam upon the canal, the ratio of time will not exceed one half, or at most two thirds, which the Ontario will bear to the Erie route." This would bring the velocity on the part of the route which is actually canal, between two and a half and three miles per hour. With this explanation, the amount of truth and fairness contained in the following, from the document, page 19, will be properly appreciated.

"Mr. Johnson, in making a comparison between this route and the Erie Canal, puts the velocity on the Erie Canal at two and a half miles per hour; and on the proposed steamboat canal at five and a half miles per hour. We suppose he contemplated steam power to enable him to obtain this superiority in speed, which, by the usually received principle of computation, would require nearly five times as much power as a speed of two and a half miles per hour!" and thus the matter is left without any further explanation, permitting it to be inferred that five and a half miles per hour, including lockage, was intended in the confined channel of the canal, and that five times the customary resistance is in consequence to be encountered!

On page 14 of the document is the following: "In speaking of the application of steam power to canal navigation, Mr. Johnson calls it a 'great and growing power of the arts.' This solecism is followed by the remark that the 'ingenuity of scientific and practical mechanicians, have been largely put into requisition to improve this truly noble engine of art,' and that 'the application of this power is made with great simplicity,' and 'they see no reason to believe there is well founded probability of any such improvement in its application to navigation, as will warrant a reliance in laying the foundation of a project that will cost millions,' &c.

We are here given to understand that improvements in the application of steam to navigation, have reached their ultimatum,—and that in a work which is to last for ages, no provision is necessary for any anticipated improvement. The idea is too absurd to need refutation. There never was perhaps in the history of the world, a period when the spirit of improvement was more generally abroad, and more successfully at work than at present: and in no one branch of the arts, is there a greater promise of a favorable result, than in the application of steam to navigation.

With what justice it is asserted that the project is to cost millions, &c., the preceding pages will show. Instead of causing any extra expenditure, it will save to the State an outlay at the present time of from three to three and a half millions of dollars, and afford a communication better suited to the ordinary methods of transportation.

On page 18 it is stated that "the navigation of the canal by schooners, requires the passage from one side of the canal to the other, by a pivot or drawbridges, for public roads, and for the accommodation of farms. Mr. Johnson proposes scows or floats, securely moored in basins formed out of the main range of the canal. He says, between Utica and Rome, there is upwards of 20 farm bridges. Between Utica and Little Falls, there is a fraction over 3 farm bridges per mile, for 22 miles."

The manner in which the word *upwards* is italicised, with the statement which follows, leaves it to be inferred that I had purposely underrated the number, and that there were nearer 45 than 20, the distance from Utica to Rome being 15 miles. Now there is actually in this distance but 21 farm bridges, and this fact could as easily have been ascertained by the authors of the document, as the one they presented!

The declaration that scows or floats were proposed by me as a substitute for road bridges, is wholly without foundation. In the description of the character of the canal, I stated that "farm bridges

were incompatible with the character of the navigation." The plan of scows and floats, was suggested to be used in extreme cases for farms only, where road bridges were not accessible, until "the canal should become a boundary of property." The formation of basins and bridges on the towing-path is no plan of mine, and was neither intimated or contemplated in my report; but is a creature of the imagination of the authors of the document, and is such an one as no intelligent engineer would think of adopting. The fact that scows or floats were suggested as a temporary, and not as a permanent arrangement, was clearly expressed in the report; and had the writers of the document but consulted the estimate, they would have seen that pivot bridges were provided for in every instance for the roads, and not a single item for scows or floats was presented; and that the damages for injury to farms, in consequence of intercepting the transverse communication, were all included in the item of commutation for farm bridges.

I have been more particular on this subject, as the authors of the document, in their disregard of facts, have been the means of leading the Canal Board into error, and causing them to do an act of injustice to myself.

What renders the course taken by the writers of the document still more inexcusable, is the fact that upon either plan of improvement, the system of farm bridges must, in most cases, be abandoned. Aside from any considerations of economy, the idea of bridges of that description, 80 or 90 feet long, and raised 5 or 7 feet higher than the present ones, viz. the surface of the water raised 3 or 4 feet, and 2 or 3 feet added to the height of the bridge, is preposterous.

I repeat again that the probability is, farm bridges must, in most cases, be abandoned; and it would not be surprising if, in many places, where the canal is intersected by roads, none but pivot bridges should be tolerated, and this, too, whether *schooners are allowed to pass upon it or not*.

On page 11 of the document, this assertion is made, that "Mr. Johnson proposes the towing plan on Lake Ontario." It is sufficient to say that I made no such proposition. The statement is devoid of truth, and hence all the deductions from it, (so far as they refer to myself,) possess the same character. It is unpleasant to be compelled to speak thus plainly, but a regard for truth, and my own reputation, requires it.

On the subject of the estimate of cost of the route from Utica to Oswego, no opinions are presented in the document. With sufficient facts before them to have decided whether it appeared to be ample or otherwise, they avoid meeting the subject fairly, and merely state, as a general rule, that "no great reliance can be placed upon cursory surveys." That there is truth, too much truth, in this remark, I will readily grant, but it strikes me as coming with an extremely ill grace, from the particular quarter whence it issues.

The estimate which I presented was intended to be ample, and I do not doubt that it was fully so, on the plan contemplated. There may have been omissions in some instances, and in others the prices may have been underrated, but in the great majority of cases they were intended to be sufficiently liberal to cover all deficiencies. I do not assume to be infallible. The examples which I have witnessed of the errors of others, their pretensions and failures, have led me to distrust, and consequently to scrutinize more closely my own opinions. The survey and report upon the Ontario and Hudson Canal, was accomplished at a season of the year the most unfavorable, and with very limited time and means. The great object in view was to draw the attention of the public to the most effectual means of providing for the prospective increase in trade, between the States and Territories west, and the city of New York. It was the duty of the authors of the document, called upon as they were, formally and officially, to have viewed the subject in the most enlarged and liberal manner. If the details of the plan as presented in my estimate for the Ontario route, were not as perfect as they should have been in any particular, it was their duty to propose others more consonant with their particular views.

They should have confined themselves exclusively to principles, placing the rival projects solely upon their own merits, independently of any statements or opinions which I might have advanced.

Had this course been taken, I should never have troubled myself to pen this communication.

The general character of the document of Messrs. Jervis, Hutchinson and Mills, is, I regret to say, very different from this. It is limited, illiberal, and partial in its views, and deeply fraught with error and misrepresentation. The public will be able, with the preceding explanations, to judge of its merits, and I confidently submit the subject to their decision, believing that they will properly appreciate principles and motives, and that their award will be impartial.

E. F. JOHNSON.

Utica, April, 1835.

THE HAERLEM RAILROAD COMPANY made a visit of examination on Saturday, accompanied by many members of the Senate of the State, now sitting here as a Court of Errors, and of the Corporation—together with other invited guests—to their road.

After examining the whole line of works, completed and to be completed, a handsome dinner was served to the Company and their guests, at the Prospect Hill house, which went off with great spirit.

Not having been able to avail ourself of the invitation of the Company to be present on this occasion, we give, from the Gazette, the following particulars respecting the Tunnel, now constructing at the Haerlem heights.

The operations, now in progress in the Haerlem Railroad, are entrusted to the management of Mr. John Rutter, an experienced miner from Cornwall, England, as superintendent, and Mr. John Ewen, Jun. Engineer.

The tunnel commences at the southerly side of 91st-street, and terminates at the northerly side of 94th street, and will be, when completed, 844 feet in length, 24 feet wide and 21 feet high in the centre. This is by far the most extensive work of the kind in this country, and is even more so than that of the tunnel on the Liverpool and Manchester Railroad, which is only about 600 feet long, 22 feet wide, and 16 feet in height. Each end of the tunnel will be finished with a handsome stone facing, so as to give it a conspicuous and pleasing appearance. There are at present about seventy-five men employed on the tunnel and open excavations, who work in gangs of twenty-five each, eight hours at a time, both day and night. The excavation was commenced about two months since, and ninety feet have already been completed, and the whole work will be finished in about eighteen months from the time it was first undertaken. The embankment commences at 100th street and extends to 106th street. This will be a most substantial work, as the whole will be supported by slope walls of dry masonry. At the crossing of the streets there are handsome arched carriage-ways, supported by stone pillars. At the northern termination of the embankment, the bridge commences, extending from 106th to 108th streets.—This bridge will be similar to that of the one now constructing by the New Jersey Railroad Company, over the Hackensack River, and is denominated the Truss Bridge, the invention of Ithiel Town, Esq. It will be 620 feet in length, supported by two stone abutments and two piers, with a span of about 200 feet.

**NEW-YORK AND ERIE RAILROAD COMPANY.**—A general meeting of the Stockholders of this Institution was holden, under an invitation from the Board of Directors, at their office, on the 29th September, ultimo. The First Annual Report of the Board, setting forth a full statement of the proceedings and prospects of the Company, was read to the stockholders, and is to be published pursuant to their request. We hope to be able to present it to our readers during the coming week, accompanied with the official account of the resolutions adopted by the stockholders on accepting the report.

On the 30th of that month, the President of the Company, in pursuance of the settled policy of the Board in conducting with special regard to the public interest, the great enterprise committed to their charge, addressed the following letter to the Mayor of this city:

NEW-YORK, September 30, 1835.

To his Honor the Mayor of the City of New-York.

SIR,—The Directors of the New-York and Erie Railroad Company, think it right that the Mayor of the city of New-York should, *ex officio*, be a Director of that Company, in order that the right of inspecting their books, and of being intimately acquainted with all their transactions, in which the city of New-York must necessarily be deeply interested, should belong at all times to its Chief Magistrate.

It is not expected nor desired that the Mayor should be a Stockholder in the Company.

I remain, Sir, respectfully yours,  
JAMES G. KING,  
President of the N. Y. & Erie Railroad Co.

Which was answered as follows:

NEW-YORK, October 1, 1835.

SIR,—I have your letter under date of yesterday, suggesting that the Mayor of the City should be, *ex officio*, a Director of the New-York and Erie Railroad Company.

I think the making the road alluded to vastly important; that it would add greatly to the business, the wealth, and population of our city: and if it is the belief of the Directors, that the Mayor should be *ex officio* a Member of the Board, I shall assent to it; but I concur with you that he should not be a Stockholder. Respectfully your obedient servant,  
CORNELIUS W. LAWRENCE.

TO JAMES G. KING, Esq.  
President of the N. Y. & Erie Railroad Co.

At the election which took place on the subsequent day, James G. King, Peter G. Stuyvesant, Samuel B. Ruggles, John Duer, John G. Coster, Stephen Whitney, Peter Harmony, J. Groen Pearson, Pelatiah Perit, Elbert J. Anderson, Michael Burnham, James Boorman, John Rathbone, jun., William Beach Lawrence, and George Griswold, of this city; Jeremiah H. Pierson, of Rockland county, and his Honor Cornelius W. Lawrence, Mayor of the city of New-York, were unanimously elected Directors for the ensuing year. And at a meeting of said Directors, held on the 2d of October, James G. King, and Peter G. Stuyvesant were re-elected President and Vice-President.

**STEAMBOAT LAUNCH.**—A very fine steamboat of 700 tons, was launched yesterday, from the ship yard of *Brown & Bell*, about 2 o'clock.

She is called the *Massachusetts*, and belongs to the Transportation Co., of the Sound, where she is to run in connection with the Boston and Providence railroad, at the opening of the next season.

This noble vessel—built of timber heavy enough for a line-of-battle ship, yet modelled, and light to the eye, and buoyant on the water, as a cutter,—is 203 feet long on deck, with 29 feet beam. The grand saloon below is 170 feet long, and she will have accommodations for 400 persons. She will be propelled by two engines of 120 horse power each, with copper boilers—and is to be commanded by the experienced and esteemed Captain WILLIAM COMSTOCK. At her bows, the Indian Chief *Massassoit* frowns over the waters, which those who once knew and ruled, now know no more. Altogether, this is a magnificent specimen of a steamboat.

On the same spot, whence the *Massachusetts* was launched, the keel of the *Rhode Island*, a still larger boat, for the same Company, was immediately laid.

Success to such enterprise!

#### Enlargement of the Erie Canal.

**MEETING AT ROCHESTER.**—At an adjourned meeting of the citizens of Rochester, held at the Court House, on the evening of the 21st of September, ult., Gen. Jacob Gould was appointed Chairman, and E. Darwin Smith, Esq., Secretary. The committee of forty, selected at the previous meeting, to whom was referred the contemplated enlargement of the Erie Canal, presented the following memorial and resolutions, which had been reported to that committee by their sub-committee, composed of Myron Holley, Jesse Hawley, David S. Bates, Lyman B. Langworthy and Henry O'Reilly, as their report, which having been considered and adopted, was ordered to be presented to our citizens for signature, and then transmitted to the Canal Board previous to their meeting, on the 20th of October next.

The committee who submitted to the meeting the report of the Canal Board, made to the Legislature on the 30th day of March last, and the letter of the Engineer, dated March 23, 1835, addressed to the Canal Board, as fully sustaining, in its statements, and reasoning, the enlargement of the Erie Canal, to the dimensions of eighty feet width and

eight feet depth. On consideration of these documents it was ordered that such parts of the report and the letter of the Engineer's as should be pertinent to the object of this meeting, should be republished and circulated under the direction of a committee of publication and correspondence.

#### MEMORIAL.

To the honorable the Canal Board of the State of New York.

The subscribers to this memorial are residents of the State near the line of the Erie canal; and many of us have long been, and still are, extensively engaged in the business of transportation upon it. We have habitually observed its effects, and shared in its influences; and suppose no private members of the community have been more incited by interest, or had better opportunities to understand all its bearings upon public and private prosperity.

We were exceedingly gratified with that enlightened regard to one of the most important subjects of their care, which led the Legislature, in May last, to provide for the enlargement of this great work. And we congratulate each other upon the wisdom, which placed the time, and mode, and measure, of such enlargement, in the almost unrestricted discretion of the Canal Board; and more especially as the law to which we refer, was passed, after due reflection and deliberation, upon your report of 30th March preceding. That able document, with the scientific and satisfactory letter appended to it, addressed to your honorable body by three of your engineers, appears to us to indicate the most obvious and efficient means of giving the happiest development to the great system of internal improvement, which this State has so long, and so profitably pursued.

With such impressions we ask leave to offer to your consideration the following resolutions and statement:

1st. Resolved, That the interests of this State require that the capacity of the Erie canal from Albany should be greatly enlarged.

2d. Resolved, That as a capacious navigable outlet to connect the trade of our large upper lakes, with the Atlantic, the extent of this enlargement should be adapted to the exigencies of a commerce greater than was ever carried on in the interior of any continent; and that it should be limited only by such dimensions as will require the least practicable power of traction, in boats carrying at least one hundred and twenty tons burthen, and in such numbers as will ultimately require double locks for their transit.

3d. Resolved, That our observations, calculations and experience, confirm us in the opinion, that such dimensions cannot be less than eighty feet width of water at the surface, with eight feet depth.

4th. Resolved, That no aqueduct, deep cut, or passage through city improvements, should be constructed on a less width of water, than is sufficient freely to float two boats of the aforesaid tonnage, abreast.

5th. Resolved, That the locks, and other improvements hereafter to be constructed on the canal, should all be adapted to the proposed scale of enlargement.

6th. Resolved, That it will become the policy of this State, as soon as it may be consistent with its constitutional charter, to complete the enlargement of her great artificial water-way; and then to provide liberally for all the ramifications from this spinal cord of her internal navigation.

7th. Resolved, That we deem the construction of the Erie Canal on its present dimensions, as a measure of economy wisely adapted to the greater work which we now contemplate; inasmuch, that if our present views had been originally entertained by judicious and practical statesmen, they would have been amply justified in giving it such minor dimensions:

1st. As a large experiment to convince the incredulous of the advantages of the work:

2. As the most useful engine which could have been devised to facilitate the ulterior construction.

8th. Resolved, That considering the natural advantages which the State of New-York possesses in her population, her wealth, her experience, her enterprise, and her reputation, to obtain and secure the trade of the Western Lakes and a portion of the valley of the Ohio, it belongs to her enlightened statesmen, to accomplish a work which will contribute so largely to the individual wealth and public

prosperity of her citizens; and merit the benedictions and gratitude of posterity.

JESSE HAWLEY,  
TIMOTHY CHILDS,  
ISAAC HILLS,  
LYMAN B. LANGWORTHY,  
JACOB GOULD,  
THOMAS H. ROCHESTER,

Committee of Publication and Correspondence.

**MAD RIVER AND LAKE ERIE RAILROAD.**—A public celebration was had at Sandusky, on the 17th ult., on the occasion of commencing the Railroad that is to connect that fine lake port with Dayton, and thence through the Miami canal, with the Ohio at Cincinnati. General Harrison, we observe, was present, and was much complimented.

With regard to the Engineer of the work, we copy the following honorable tribute from the Sandusky Clarion:

Too much praise cannot be given to the Engineer of the company, James H. Bell, Esq., of New York, for the ability and zeal which he has manifested in the discharge of the laborious duties devolved upon him. The letting of the contracts for 35 miles of the Road on the 16th, reaching between this place and Tiffin, tested the correctness of Mr. Bell's estimates, and afforded ample proof of skill in his profession. The contracts were taken at prices considerably below the estimates, although fears had been entertained that they had been made too low. So favorable a commencement of the active operations of the company, gives strong encouragement for the future.

The *Montgomery Register* states that \$400,000 of the stock of the Montgomery Railroad was promptly subscribed in that city. After the closing of the books the scrip was sold at an advance of ten per cent.

[COMMUNICATED BY THE NEW YORK AMERICAN.]  
Extract of a letter from a gentleman who has been travelling through the greater part of the State this summer.

ITHACA, September —, 1835.

"I am very much inclined to believe that, in the universal rage which has so prevailed of late among our farmers, to remove to the far west, many advantages are overlooked nearer home. I could not help thinking so, lately, when passing a few days in the town of Binghamton, in Broome county, which is certainly one of the most beautiful little towns in the State. It is situated on a plain, at the junction of the Susquehanna and Chenango rivers, and surrounded by an amphitheatre of hills. It is regularly laid out, and from appearances, must be a place of considerable business, as I counted between twenty and thirty, three story brick and stone stores, well filled with goods. There are several churches, and some handsome private residences. Many points in the neighborhood offer very beautiful views, and it has the reputation of being one of the healthiest parts of our country. The canal is rapidly progressing, which is to open a water communication all the way to New York, and the engineers of the New York and Erie Railroad Company are busily engaged, laying out their road, which is to pass near, if not through, the town. Many new buildings have been erected this summer, and more are in contemplation. The flats on the river are well cultivated, and the cleared fields are gradually encroaching on the hills, which offer the finest prospects for the raising of sheep—now the most profitable stock. The hills are generally covered with white oak, which will soon find its way to the city, in the form of staves. This part of the country, and in fact, all that part of it, generally termed the Southern tier of counties, has been kept almost in a state of nature, for the want of good avenues to market. They will now have them, and the inhabitants will turn their attention from lumbering, to the cultivation

of a soil, which, if not so rich as the lands of the far west are said to be, yet offer many great advantages to compensate the husbandman for his labor. When I was there, they were giving the hands on the canal, fourteen dollars per month and found, with the prospect of work all winter.

I believe if this part of the country were better known it would attract the attention of both emigrants and men of capital."

**THE WESTERN TRADE.**—The Pennsylvania Canal to Pittsburgh, and the Erie Canal from Albany to Buffalo, are rivals for the trade of Ohio.—That part of Ohio which borders on Lake Erie, and upon the Ohio Canal, which commences at Cleveland, has access to the New York market at a less cost than to that of Philadelphia, whereas the lower part of that State, which borders upon the river Ohio, finds Philadelphia its natural market. The merchants in purchasing their foreign goods study the question of freight, with a nicety of calculation almost as refined as that practised at the mint. Upon articles possessing much bulk and little value, the difference of a few cents per 100 pounds in the expenses of transportation, is of considerable importance, involving perhaps the most of their profit, and hence they give a preference to the route which leaves most money in their pockets. The tolls of the present season have been favorable to the New York Canal, and many goods have been sold this summer in Philadelphia, groceries, as well as dry goods, upon the condition that the seller would pay the freight to New York. After the completion of the canal now in progress, between Pittsburgh and the Ohio Canal, this advantage of the New York canal over ours will disappear.—Goods may be sent to Cleveland from Philadelphia as cheap as they can from New York, and we shall enjoy the advantage besides of three months navigation whilst the New York Canal is frozen up.—[Philad. Gaz.]

**RAILROAD "MONOPOLIES."**—The following sound and forcible remarks were made by A. Stewart, Esq. of Utica, N. Y. in the course of an address delivered before the Convention recently held at Oswego, for the purpose of furthering the great undertaking of the railroad from the Hudson to Lake Erie.

What has been done on the subject of railroads and canals in New-York, Pennsylvania and Ohio, in the last seventeen years, will exceed all that has been done by Europe from the morning of time. The sister States will be laid under lasting obligation to New-York, for her great example in the work of internal improvements, which has given new impulse to the affairs of mankind.

What better could New-York do with the vastness of her resources, than judiciously expend 100 millions of dollars in railroads and canals? Every dollar would be quadrupled in private and public benefit.

The world has been exhausted by all her resources, hitherto, in *War* and *Architecture*. The war-wasted resources of the world, would have made every inch of land a garden, from the regions of eternal ice to the burning line.

Our late patriotic war cost us 130 millions of money, which would have made us ten thousand miles of railroad and canal. Had this 130 millions been appropriated, it would have left my country ahead of the world.

Look at the waste of public money and human labor, in the useless architecture of the pyramids, those "piles of wonder," and "sleeping places of death," mere pride and ostentation! The proud monarchs by whom built, their names have perished from the records of human remembrance; the same labor and money would have united the Nile and Red Sea, the Persian Gulf; and saved the long and dangerous navigation around the Cape of Good Hope.

Look at the Langue doc Canal—the only monument likely to rescue the memory of Louis 14th from oblivion; but what was this expenditure compared with the waste of money on building the palaces, and making the wild hills of rocks and fictitious lake at Versailles—amounting to the enormous sum of 400 millions of dollars—a sum sufficient to have brought a railroad and canal to the gate of every city and village in France, and left a direct communication between such city and village, and the Mediterranean and Atlantic.—These same palaces at Versailles are now a fright-

ful solitude; nothing is seen but an old decayed officer hobbling over the piles of sculpture and through empty palaces, to show the stranger and travellers those vacant abodes of the departed enemies of man.

The energies of the Grecian and Roman nations were squandered upon those expensive erections of marble which inflamed pride and ambition without benefiting the commerce of those nations. What would have made ten miles of canal, was expended on the polish of the columns of a heathen temple.

Look at modern Europe, covered with abbeys, castles, and the nonsense of kings, by which the power of the nation has been wasted in the pride of architecture.

The money spent on any one of the 1000 wars of Europe would have connected the Indian ocean with the Mediterranean, and the Pacific with the Atlantic by the Isthmus of Darien; and the too often disastrous navigation around Cape Horn and that of Good Hope might have been avoided, and the navigation of the globe shortened one-half.

But the modern cry which has been heard against improvements of this lovely land, is the senseless cry of Monopoly!—Monopoly!—Monopoly! A rail road is a wonderful monopoly,—in which the rich man's money is expended in making the poor man's road. Take for example the contemplated railroad from Utica to Schenectady, 80 miles; it is found that 200,000 poor persons pass over this road now, in a year, the stage fare is \$3—time is had going 34 hours, in good 12. Contemplated price for a poor man on the railroad, \$1—to go through in four hours saves \$2 in money—but he saves his own capital—time. The Rich built the last described road, and distribute of positive benefits among the Poor (supposing 200,000 to travel over it)—no less than \$2 each, or \$400,000 among 200,000 persons. Which will divide the greatest profit, the Rich men who own the stock, or the Poor men who travel the road?

But this is not all; the rich men think it hard to spend any more than their income, and encroach upon their principal. But the poor man, when he spends a day or an hour of time in travelling, is spending, so far as time is concerned, his very capital—for his only capital is time. A railroad is an annihilator of distance, and a time saver, and therefore the poor man's friend—and when he uses it, it takes less of his capital than any other mode.—Rich men ought to be compelled to make railroads through the great thoroughfares of the land, at a just toll; as by this means the money of the rich benefits the poor man, stranger, and traveller, as much as it does the rich. The poor man gets a benefit from this monopoly every time he uses the road; the stockholder gets his dividend again in six months on the road; but the poor man gets his dividend as often as he finds it necessary to use the road. But forbid the rich to invest their money in these railroads, and they will purchase out the farmers. The 60, 75, 100, and 150 acre farmer, without any outlet for his produce, sells one after another to the rich man, who buys out 100,000 acres, and leaves no freeholder, until his plantation reaches another rich man's. Who have these rich men under them? Not the sturdy owner of the soil—but the grovelling tenant, the cattle tender, the shepherd and his minions. Then, for want of the monopolies or railroads, benefiting the whole land through which they pass, making each little freeholder's farm a garden, lovely and desirable—our farmers, without roads, sell to the rich, and his away to the rolling prairies of the far west.

The New-York American gives the amount collected for tolls on the Pennsylvania canals and railroads at \$581,000, for the fiscal year ending on the 12th of September; and adds that this sum is about one-half of the amount collected on the New-York canals for the same time. In this comparison the American must have referred to the amount of tolls collected during the present season of navigation, on the New-York canals, which amounts to something more than a million of dollars, and not to the receipts for the fiscal year. The whole sum received for tolls on the New-York canals from the 30th of Sept., 1834, to the 30th Sept. 1835, will not vary much from \$1,500,000.—[Alb. Argus.]

**NONOTE, Sept. 30.**—THE NEW CROP.—A bale of cotton of choice staple, being the first of the new crop that has appeared at our market, was brought in yesterday morning in a wagon from Chowan county, (N. C.) and readily sold at 19 cents.

**OHIO STEAMBOATS.**—We are informed on good authority that the number of boats built the present year between Louisville and Pittsburgh, including those places, will not fall short of fifty.—About 35 of these are for distant parts of the country—for the southern and westernmost States; the remaining 15 will be added to our river trade, increasing the number of boats thus employed to about 60. Supposing the amount of freight conveyed in each boat to be 40 tons down and 20 up, some opinion may be formed of the amount of merchandise transported yearly upon the Ohio.—The river may be estimated to be navigable from six to eight months in the year, and each boat to perform twelve trips from Wheeling to Louisville and back. Each boat, then, transports 12 times 40 tons down, and half this quantity up, equal to 720 tons. This, multiplied by 60, the number of boats, gives 43,200 tons as the gross amount of merchandise transported yearly in steamboats upon the Ohio.

To fix the value of this merchandise is not so easy. Yet something like accuracy may be obtained. It is said that a wagon load of dry goods, weighing 2 tons, will cost about 4,000 dollars, and that western merchants who purchase 8,000 dollars' worth receive them generally in two wagon loads. This would make a ton of dry goods worth 2,000 dollars. As grosser and heavier articles, however, are sent down the river in large quantities, the value per ton may be rated at 500 dollars. Forty times 500 give \$20,000 as the value of each cargo; this, multiplied by 12, gives 240,000 as the amount conveyed by each boat during the season; and this multiplied by 60, the number of boats, gives the sum of 14,400,000 dollars as the value of the down freight in a single year. This is independently of the merchandise conveyed in keel and flat boats, and the immense amount of lumber which almost covers the face of the river in the spring season. The value of the merchandise transported up the river may be estimated at about 1,500,000 dollars. Making the total value of merchandise transported in steamboats yearly on the Ohio, upwards of sixteen millions of dollars.—[Wheeling Gazette.]

**ST. JOSEPH'S, FLORIDA.**—This is a new town, recently laid out on St. Joseph's Bay; to which place the principal inhabitants of Apalachicola are about to remove, owing partly to a difficulty about their land titles in that town, which are derived from Spanish grants, but mainly to the superior natural advantages of St. Joseph's over Apalachicola. St. Joseph's is said to be the finest harbor upon the Gulf of Mexico, superior to Pensacola, there being twenty-three feet of water at the former and twenty-one only at the latter port over the bar, and the harbor is so formed that like Newport, in Rhode Island, vessels can always enter it. As nearly the whole coast of the Gulf is belted with sandbars, which present an impassable barrier to vessels of a large depth of water, St. Joseph's which is almost a solitary exception on the Florida coast cannot fail to increase rapidly in population, and in a very short time to raise into great commercial importance.—To the natural advantages of the place, the enterprising settlers carry with them capital, intelligence, and untiring industry.

The inhabitants, though yet scarcely located there, are building wharves and roads and making other improvements, and have contracted for a Railroad to Lake Wimico, six miles, which is to be finished this year.—This opens a communication with the Apalachicola river, and thus completes the communication with Columbus, Georgia.—[Boston Post.]

**INDIA RUBBER FABRIC.**—A discovery has been recently made by Mr. Charles Goodyear, by which India Rubber after having been dissolved, can be restored by a cheap process to its original whiteness, and the pure gum formed into a fabric to be used instead of cloth, leather, or parchment, and can be moulded into almost any form, and can also be combined in a variety of ways with cloth, cordage, or leather. Being first made white, it admits of every shade of color worked in and as durable as the rubber itself. A variety of fine specimens are now being exhibited at the Mechanics' Institute at Castle Garden, which will give an idea of the general utility of the invention. From our little experience and that of one of our friends in the use of this fabric, we are disposed to the opinion

that it is valuable, and the invention one of importance.—[Jour. Com.]

[From the Mercantile Advertiser.]

**THE TOBACCO CROP.**—Extract of a letter from a commercial house of the first respectability, to a house in this city, dated—

RICHMOND, October 1, 1835.

"We this morning give you information of a severe and killing frost, which, from all accounts, will greatly injure the now growing crop of tobacco. Some say one half the crop is either cut perfectly green, or bitten with the frost; but we are at all times willing to make allowances, and in this instance will put it down at one-third of the crop, to be injured by the frost, which in this market has already the effect to raise the price of the article."

Another letter from Petersburg, (Va.,) of the same date, to a gentleman in this city, says—

"Prices of tobacco of all grades have advanced, and no doubt will still go higher, as we have had a sharp frost this morning, which has killed a great deal of the crop of tobacco, and also of cotton, both being about a month later than usual."

The U. S. Branch Bank at Baltimore closed its business on Tuesday the 29th ult. at 3 o'clock, P. M.—and next morning at the usual banking hour, the Merchants' Bank had taken possession, and commenced operations. Upwards of 600,000 dollars of the capital of this Bank is already paid in, and the balance of its capital is called in, and to be paid, in instalments of one-fifth (400,000) every sixty days until the whole two millions are paid up, and thus rendered immediately available for banking purposes. By stipulation, the Merchants' Bank redeems the notes of the Baltimore Branch, and pays the sum due to the depositors of the latter. In fact, every circumstance, likely to effect public or private utility has been regarded, in the arrangement between these institutions, and so ordered therein, as to promote the general convenience, as well as the interests of the parties. As it is well remarked in a morning paper: One important feature in the constitution of the Merchants' Bank, is the establishment of an Exchange Committee which meets daily at twelve o'clock, to decide on offers of Domestic Exchange on any of the numerous places embraced in their list. There can be no doubt that the carrying out of the enlarged and liberal views entertained by the Board will render the Bank a most efficient means of facilitating the business operations of this growing community.—[Baltimore Chronicle.]

**BALLOON COMMUNICATION BETWEEN LONDON AND PARIS.**—We perceive that the grand aerial project which occupied so much of the attention of the Parisian quidnuncs about this time last year, is revived—with this difference only, that the scene of operation, or to speak more properly, perhaps, the starting-post, has been shifted from Paris to London. The projectors who have now taken unto themselves the style and title of the "European Aeronautical Society," announce in the newspapers that their "first aerial ship, the Eagle, 160 feet long, 50 feet high, and 40 feet wide," and which is to be (!) "manned by a crew of seventeen persons," may be inspected at a certain dock in the neighborhood of Kensington, previous to making its first trip "from London to Paris and back again;" after which it is to make similar trips to Brussels, Amsterdam, Berlin, Munich, Madrid, &c., till the practicability of establishing an aerial communication between London and the other capitals of Europe, is fully and incontrovertibly demonstrated! The scheme is, after all, only a copy, and that but an indifferent one, of a plan that was proposed as far back as 1796, by an engineer of the name of Campenas, and not only entertained by the French government,

but sanctioned by that select body of savans, the French Institute. Campenas wrote a long letter to Bonaparte, then General-in-Chief of the army of Italy, from which we extract a paragraph or two. "General Citizen.—The artist who addresses you, filled with the most lively gratitude, will erect, if the means of execution be afforded him, a vast edifice, whence, at the conclusion of his labors, there will issue an Aerial Vessel capable of carrying up with you more than 200 persons, and which may be directed to any point of the compass. I myself will be your pilot. You can thus, without any danger, hover above the fleets of enemies jealous of our happiness, and thunder against them like a new Jupiter, merely by throwing perpendicularly downwards firebrands made of a substance which will kindle only by the contact and percussion at the end of its fall, but which it will be impossible to extinguish. Or perhaps you may think it more prudent to begin at once, by forcing the British cabinet to capitulate, which you may easily do, as you will have it in your power to set fire to the city of London, or to any of the maritime towns of England. From the calculations I have made, I am convinced that with this machine you may go from Paris to London, and return back again to Paris in twenty-four hours, without descending. The object I propose is to establish in the great ocean of the atmosphere a general navigation, infinitely more certain and more advantageous than maritime navigation, which has ever disturbed the tranquillity of mankind—to restore the perfect liberty of commerce, and to give peace and happiness to all the nations of the universe, and unite them as one family. By great labor I have surmounted the multiplied obstacles which presented themselves before me; and my progressive discoveries are developed in a work which I have prepared, consisting of about 400 pages, and divided into five parts." How lucky for England that the "new Jupiter" had other things on hand, to divert his attention from this most appalling (though not more appalling than sensible) scheme of national destruction!—[London Mechanics' Magazine.]

**STATE OF EDUCATION IN ENGLAND.**—From a summary, prepared by Mr. Rickman, of the Returns made to the House of Commons, on the motion of the Earl of Kerry, it appears that there are 4,000,000 of persons in England, under 15 years of age, and only 1,200,000 receiving daily education. If we allow half a million for the number of persons under 2 years old, and also a similar deduction for those who at an early age receive the rudiments of education in the nursery, and those of the richer portion of the community, who receive what is termed home education, there will still remain above 2,000,000 individuals, who both for their own sakes and the sake of society should receive instruction, but who are entirely destitute of its advantages.—[London Mechanics' Magazine.]

## NEW-YORK AMERICAN.

OCTOBER 3-9, 1833.

## LITERARY NOTICES.

**THE PICTURESQUE BEAUTIES OF THE HUDSON RIVER AND ITS VICINITY:** Illustrated by a series of views from original drawings, taken expressly for this work, and engraved on steel by distinguished artists, with historical and descriptive illustrations by SAMUEL L. KNAPP, Esq.—Part 1.; New York, J. DISTURNELL.—The title page tells so amply the nature and objects of this publication, as to leave to us only the expression of an opinion as to the manner of its execution—and that we can, with a good conscience, give in terms of decided admiration. The engravings, four in number, including the vignette, are finely executed, particularly that of the harbor of New York, as seen from Bedlow's Island. The least good, is the view of Hellgate; the accompanying notices are well done, and may be read for information, we are sure, by the great majority. The type, paper, and materials of this work are really beautiful.

**THE DISTRICT SCHOOL, OR NATIONAL EDUCATION;** by J. ORVILLE TAYLOR—third edition, Philadelphia, CAREY, LEA & BLANCHARD.—In apprising our readers of this new edition of Mr. Orville Taylor's capital book on popular education, we are glad of the opportunity of stating, that upwards of three thousand copies of it, have previously been sold. This augurs well, as to the desire of the public to be informed, which is the first step to improvement. This third edition has been, in great part, as we learn from the preface, re-written; Two new chapters have been added—No. VII., in favor of Seminaries for teachers, and No. XIX., urging the study of natural history in our common schools—and many valuable notes have been added. The book is also now divided into paragraphs, to adapt it to the use of schools, as a reading class book.

We cannot better occupy a little more space, perhaps, than by stating that the author of this volume has, during the past summer, been on a missionary tour throughout our State, to inculcate the necessity of improving our Common Schools, and of calling attention to the advantages offered by the law of the last Legislature, authorizing the establishment of small district libraries. The result of this mission has been satisfactory. In many districts the necessary tax has been voted, and in all, where Mr. Taylor had an opportunity of stating the case, good seed, it is hoped, has been sown, of which some, it is reasonable to believe, will ripen into fruits of knowledge and virtue. While writing this paragraph, we have received the Oneida Whig, in which we find the proceedings of a large meeting, held at Utica, on this subject—and in order to show the spirit in which they were conducted, we annex the resolutions:

**ONEIDA COUNTY COMMON SCHOOL CONVENTION.**—At a numerous Convention of teachers and others, inhabitants of Oneida county, interested in the subject of Common School Education, held at the Academy in the city of Utica, on the 24th day of September instant, Alvan Stewart, Esq. was called to the Chair, and James Watson Williams appointed Secretary.

The Convention was briefly addressed by the Hon. Hiram Denio, and the following resolution proposed by him, was unanimously adopted:

Resolved, That universal education is an indispensable concomitant of popular institutions, and that it is the obvious dictate of patriotism, to provide that the diffusion of intelligence shall be co-extensive with the elective franchise.

The Chairman (A. Stewart, Esq.) then proposed the following resolutions, which, after some re-

marks by the mover and other gentlemen, were adopted:

Resolved, as the sense of this Convention, That we perceive great wisdom and patriotism in the act of the Legislature of this State passed at its last session, by which each school district of the State is authorized to appropriate twenty dollars for creating a school library in such district, with such further sum as may be necessary for a book case, and also to raise ten dollars annually for the increase of such library.

Resolved, That we recommend that the several school districts of Oneida county accept the provisions of the said act, and make all needful preparations to carry the same into full effect; believing that it will be a most important step towards perpetuating the liberties of the people, by the diffusion of moral intelligence, and the cultivation of the human mind.

Resolved, That our sister counties be invited to accept of the great benefits to be derived from the library law.

Resolved, as the sense of this Convention, That the late conduct of Pennsylvania, in suspending her common school system, is an alarming symptom, and cannot but in some degree impair the confidence of mankind in the perpetuity of our institutions, and it becomes the State of New York to march forward to further improvement in our common school system by legislation and otherwise.

Resolved, That we admire the noble and patriotic course pursued by the representative governments of Prussia and France, in relation to learning in general, and common education in particular; and we would commend Prussia as a model for the world, as under her system it will be found more difficult to escape education than to acquire it.

Resolved, That it is with pleasure that we commend Mr. J. Orville Taylor, the author of the "District School," to the public as a gentleman of talents, who, as his book will show, is a reformer of the abuses of the age in the common schools of our country.

Resolved, That we recommend that each school district purchase "the District School" as an interesting volume of the twenty dollar library.

Resolved, That the thanks of this Convention be presented to Cornelius W. Lawrence and Jas. G. King, trustees of the Common School Mission, and their associates, for their liberality in employing Mr. Taylor to visit the Common Schools of this State with a view to their improvement and elevation.

On motion of Dr. C. B. Coventry, it was

Resolved, That this Convention consider the appointment of agents to visit and examine into the actual condition of our Common Schools, as of vital importance, and absolutely necessary, in order to derive the greatest possible benefit from our common school fund.

Resolved, That the members of this Convention use their influence, and invite the co-operation of their fellow-citizens, to procure the appointment of such agents under the direction of the Legislature.

On motion of Mr. Williams,

Resolved, That the teachers of the several school districts in the county of Oneida, be requested to act as a committee in their several districts, for the purpose of awakening the attention of the inhabitants to the provisions of the law relating to district libraries, and forming libraries in pursuance of that law.

After expressing his thanks for the hearty co-operation he had received from his fellow-citizens of the county, Mr. Taylor asked the privilege of introducing the following resolutions, which were unanimously adopted:

Resolved, That this Convention deem it absolutely necessary as a first step to be taken for the improvement of our Common Schools, that the intelligent, prominent men of every school district give their influence, respect, and patronage to the district school.

Resolved, That this Convention believe that the character of our Common Schools is in a great measure in the hands of parents; and that it is the high duty of parents to their country, to the peace of society, and the individual happiness of their children, to adequately reward, respect and co-operate with their common school teachers.

Resolved, That this Convention, to insure the natural and necessary working of our excellent school system, most sincerely and earnestly request every commissioner, inspector and trustee, parent and teacher, to co-operate with the school act,

which is wisely intended, with such a co-operation on the part of the people, to give every child and youth in our State, that kind and degree of knowledge which our institutions demand.

In connection with this subject, we have great pleasure in referring to a book, now in the Harpers' press, under the following title:

**THE CITIZEN'S MANUAL;** being a Digest of the Laws of the State of New York and of the United States, which relate to crimes and their punishments, and of such other parts of the Laws of the State of New York, relating to the ordinary business of social life, as are most necessary to be generally known; with explanatory remarks: to which is prefixed an Essay on Civil Government: designed for the instruction of young persons in general, and especially for the use of schools. By ALFRED CONKLING.

Judge Conkling, who presides as District Judge of the United States, for the northern district, has prepared this volume with direct reference to schools, and with the desire of adding his contribution to the patriotic efforts now making to improve, and extend, common education. We have not had any opportunity of examining this work, but may, in all confidence, bespeak for it—from Judge Conkling's habits of investigation and pursuits—a favorable reception.

**THE LINWOODS,** or Sixty Years since in America. By the author of Hope Leslie, Redwood, &c. 2 vols.: N. Y. HARPER & BROTHERS.—It may, we think, be stated as one of the distinctive characters of Miss Sedgewick's writings, that they take a cheerful and encouraging view of human nature—and found their claim to attention, rather upon the triumphs of goodness and self-discipline, over the evils, infirmities, and temptations which beset us, than upon the vehement and despairing struggles of lawless passions, and wicked and perverted talent: they are, in short, the *antipodes* of the Byronian school.

They have another characteristic, too, which should be, as we dare say it is, one of the elements of their great popularity; and that is, their manifest aim and tendency to establish, that neither merit, nor success, are the creatures of fortune, or of easy circumstances—but that in every condition of life, good principles, a cheerful temper, and, above all, a perpetual guard over one's own evil dispositions, combined with perseverance, and generous aspirations, will lead to eminence.

Miss Sedgewick loves her country, its institutions, and its people—and this sentiment is felt, though rarely put forth directly, and never ostentatiously, in every thing from her pen. The little story of *Home*, to which we adverted with so much delight, not many weeks ago, is worthy of particular mention on this ground.

In the volumes now before us, the American feeling of the authoress would naturally find more full and direct expression—and it is so. There are no heroines, and no heroes, in the ordinary sense of the word—that is, grand leaders, performing incredible feats, and uttering endless protestations of love of country, and so forth—but the high and unfailing qualities of our yeomanry, when called forth by adequate occasion, for stations of responsibility or of peril—the self-sacrifices of sturdy freemen, contending for their rights, and the influence which in such scenes, woman can exercise, and does exercise, for good, are finely delineated in the story of the *Linwoods*. We do not mean to dissect its plot, nor betray its story, and will therefore, after advising our readers to get the book, give a short extract, descriptive of New England character:

"I have been pondering on the character of our New England people during my ride. The aspect of our society is quiet, and to a cursory observer, it

appears tame. We seem to have the plodding, safe, self-preserving virtues; to be industrious, frugal, provident, and cautious; but to want the enthusiasm that gives to life all its poetry and almost all its charms. But it is not so; there is a stronger under-current. Let the individual or the people be roused by a motive that approves itself to the reasoning and religious mind, a fervid energy, an all-subduing enthusiasm bursts forth, not like an accidental and transient conflagration, but operating, like the element, to great effects, and irresistibly. This enthusiasm, this central fire, is now at its height. It not only inflames the eloquence of the orator, kindles the heart of the soldier, the beacon-lights and strong defences of our land; but it lights the temple of God, and burns on the family altar. The old man throws away his crutch; the yeoman leaves the plough in the half turned furrow; and the loving, quiet matron, like you, my dear mother, lays aside her domestic anxieties, dispenses with her household comforts, and gives the God-speed to her sons to go forth and battle it for their country. The nature of the contest in which we are engaged illustrates my idea. Its sublimity is sometimes obscured by the extravagance of party zeal. We have not been goaded to resistance by oppression, nor fretted and chafed, with bits and collars, to madness; but our sages, hold with the transmitted spirit of freedom, sown at broadcast by our Pilgrim fathers, have reflected on the past and calculated the future; and coolly estimating the worth of independence and the right of self-government, are willing to hazard all in the hope of gaining all; to sacrifice themselves for the prospective good of their children. This is the dignified resolve of thinking beings, not the angry impatience of overburdened animals.

**THE REPUBLIC OF LETTERS.** Vols. 1 and 2, 4to.; 450 pp. each. N. Y. E. DEARBORN.—In these two volumes of the first series of the Republic of Letters, before the form was changed to the more convenient one of 8vo., may be had for *four dollars and a half!* what occupies from 40 to 50 volumes of ordinary size, and all approved and chosen works—the print, too, is distinct and clear, and the paper very good. It is scarcely possible, to have cheaper good literature.

**A PILGRIMAGE TO THE HOLY LAND, &c. &c.,** by ALPHONSE DE LA MARTINE, Member of the French Academy. 2 vols. Phil.: CAREY, LEA & BLANCHARD. For sale in New-York by WILEY & LONG.—These are not volumes of travels in the ordinary sense of that word, but the vivid and poetical impressions and imaginations of a man of genius, a poet and a philosopher, wandering over the Holy Land, with a heart deeply touched by its past history, and its associations with the great incidents of our religion.

The translation is well done, and we do not err in predicting for these volumes a large circle of readers. We have no room for extracts to-day, but shall return, more than once, to their pages for gleanings for our columns.

**OLD MAIDS;** their varieties, characters, and conditions. New York, C. SHEPARD.—This little volume is written in an agreeable vein, and in a kindly spirit. Let the following extract avouch our words:

There is, without doubt, implanted in the breast of all women, a passionate longing—an almost irrepressible desire, for the society and companionship of man. It is an instinct woven into their moral and physical structure,—it is a passion which grows with their growth, and strengthens with their strength. It has mingled with their dreams, and formed the subject of their mid-day reveries.

The bashful maiden, whose deep fringed eyelids half conceal the liquid lustre of her hazel eyes, seats herself pensively, away from observation, perchance, in the deep recess of some gothic window, or on some grassy bank, arched overhead by the "giants of the wood," and there is a voice and a mystery around her.—This is the "spirit of Love, felt everywhere;" it finds a kindred feeling in the breast of the coy maiden; and, in luxurious meditation, she lives, in the space of one brief hour, a

life of love.—But the maiden is not alone in her solitude—her heart is filled with the image of some ideal being created by her heated fancy. It comes at her bidding, shadowy and unreal; and she steepes her soul in tenderness, and with enamored accents of delight, betrays how profound, how intense and overpowering is the desire to love and to be loved. It requires only that some congenial spirit shall approach her, and the whole torrent of her affections will be let loose upon him; one touch, or one look that stirred the chord of her feelings, would fix her destiny; any incident, however trivial, that developed a correspondent tone of sensibility in one of the opposite sex, would make him the idol of her young heart,—and yet this creature, whose very frame is love, lives and dies an Old Maid.

The passions that are coursing through her veins, may indeed re-act fearfully upon herself; her face may blanch—her eye may lose some portion of its brightness—her step may become less elastic—and tender melancholy may invest her with a double charm. But year after year rolls over her head, and finds her still "in maiden meditation." Her friends, one by one, visit the Hymeneal Altar; perhaps her own sisters, amongst whom she is "the bright, the fair one," become brides.—She rejects offer after offer, and, at length is marked out by her family as an "Old Maid," who wonder why Mr. So-and-so was rejected—"an excellent man"—"good fortune," &c. &c.—and delicately hint, that she had better "have made hay while the sun shone."

Gentle creature, thou hast preserved in all thy pristine purity, thy feminine attributes—thou hast brooded so long over the love dwelling in thy heart—that man's cold, selfish and calculating affection is utterly unworthy thy acceptance. The one who could alone have fixed thy vehement longing—has never appeared; thou art too pure, too good, too holy, for those who would have wedded thee; for thy heart would have broken, and thou wouldst have sunk into a premature grave, when the sad truth had come upon thee—that man's tenderness, devotion and admiration, are changeable and perishable. When thou hadst left thy quiet home, and fixed thine affections so firmly, that to break the bond would have been destruction, thou wouldst have found, "that one was lost in certainty and one in joy;" and then thou wouldst have pined and withered like a beautiful exotic, removed from its own bright clime to another region, where factitious heat and unnatural stimuli are made to supply the want of the pure and invigorating rays of its native sun. The struggle has been severe; but thou hast triumphed nobly over sensual temptations—thou hast kept, in all its integrity, the "sea of love," whose turbulent heavings disturbed thy young imaginations; and it is now ready to overflow on every deserving thing that comes before thee. Thy sisters and friends smile at thy philanthropy, and sneer at thy simplicity; for their love and their singleness of purpose have either evaporated, or have assumed a direction widely apart from those golden hopes and joys which "maidens dream of, when they think of love."—These thou hast kept in all their original brightness, and now, though the frost of forty winters has pressed upon thee, thou art still a maiden—in mind and heart.

**THE EDINBURGH REVIEW,** for July, 1835—being No. XVIII. of Foster's re-publication.—Another of these very cheap and very valuable re-publications by Foster is here presented to us. The first paper in this number of the Edinburgh, on Sir James Mackintosh's History of the Revolution, is of the highest order. There are other very good articles in it.

**RELIGIOUS ULTRAISM; A Sermon,** delivered August 25th, at the installation of the Rev. JOHN H. HUNTER, as Pastor of the first Congregational church, in West Springfield, Massachusetts, by WM. B. SPRAGUE, DD. pastor of the second Presbyterian church Albany; Albany, PACKARD & VAN BENTHUSEN.—On a former occasion, we spoke of the distinguished clergyman whose sermon is now before us, as a "bold man," for venturing to speak plainly, unpopular truths. The epithet is alike applicable to this discourse, which arraigns the ultraism of the day, in religion and

morale, before the bar of reason and revelation and convicts it of much evil. It is no small service, in our judgment, rendered to rational piety, and humble, unostentatious moral worth, thus to strip the Pharisees of the day, of the garb of righteousness, by virtue of which they delude so many into pernicious extremes, while they disdainfully use all, who will not fall in with their rash views.

We commend this sermon to the notice of our readers.

**THE TOKEN AND ATLANTIC SOUVENIR;** Boston, CHAS. BOWEN; for sale in New York, by Freeman Hunt & Co.—This whole pretty annual is American—the designs, engravings, and literary matter—and it is certainly deserving of much praise, for so successful an effort, where, in the nature of things, success is so difficult.

This volume, too, is much larger in contents than heretofore, and the literary matter, is much of it, very clever. We would particularly instance "*Wealth and Fashion.*" Of the Engravings, "*Beatrice,*" and "*The Wreck at Sea,*" please us most.

**THE MAGNOLIA,** for 1836, edited by HENRY W. HERBERT: New York, MONSON BANCROFT.—A new, and by far, the handsomest annual ever published in America. Its Engravings are surpassingly beautiful—its pages, typography, and binding, all that taste and luxury could desire, or supply; and its literary matter of high merit. New York has reason to be proud of such a *bijou*.

The Editor has done his part well; and as this is the first of the *Magnolias*—we hope it is only the first of a long series to come—we must not dismiss it, without a specimen of his contributions. We take the following:—

#### THE DEATH OF SOTO.

By the Author of "*The Brothers.*"

But wind me in in a banner bright—  
A banner of Castile—  
And let the war drums round me roll,  
The trumpets o'er me peal!  
And bury me at noon of night,  
When gone is the sultry gleam—  
At noon of night, by torches' light,  
In the Mississippi's stream.

It was the evening of a sultry day, sultry almost beyond endurance, although the season had not advanced beyond the early spring time—the sun, though shrouded from human eyes by a dense veil of moist and clammy vapor, was pouring down a flood of intolerable heat upon the pathless cane-breaks, the deep bayous—haunts of the voracious and unseemly alligator—and the forests, steaming with excess of vegetation, through which the endless river rolled its dark current. On a steep bluff, projecting into the bosom of the waters, at the confluence of some nameless tributary and the vast Mississippi, stood the dwelling of the first white man that ever trod those boundless solitudes. It was a rude and shapeless edifice of logs, hewn from the cypresses and cedars of the swamp, which lay outstretched for a thousand miles around, by 'hands unused to aught of base or menial labor;' yet were there certain marks of comfort, and even of luxury, to be traced in the decorations and appliances of that log cabin; a veil of sea-green silk was drawn across the aperture which perforated the massy timbers of the wall; a heavy drapery of crimson velvet, decked with a fringe and embroidery of gold, was looped up to the two lintels, as if to admit whatever breath of air might sweep along the channel of the river. Nor were these all;—a lofty staff was pitched before the door, from which drooped, in gorgeous folds, the yellow banner, rich with the castled blazonry of Spain; and beside it a tall warrior—sheathed from head to heel in burnished armor, with gilded spur, and belted brand—stalked to and fro, as though he were on duty upon some tented plain, in his own land of chivalry and song. At a short distance in the rear might be observed a camp, if by that name might be designated a confused assemblage of huts, suited for the accommodation of five hundred men; horses were picqueted around; spears, decked with pennon and pennoncel, and all the bravery of knightly warfare, were planted before the dwellings of their owners; sen-

tinels, in gleaming mail, paced their accustomed round. But in that strange encampment, there was no mirth, no bustle—not even the low hum of converse, or the note of preparation. The soldiers glided to and fro, with humbled gait and sad demeanor; the fiery chargers drooped their proud heads to the ground, and appeared to lack sufficient animation to dash aside the swarms of venomous flies, that battered, as it seemed, upon their very life blood; the huge blood-hounds, those dread auxiliaries of Spanish warfare, of which a score or two were visible among the cabins, lay slumbering in listless indolence, or dragged themselves along, after the heels of their masters, with slouching crests, and in attitudes widely different from the fierce activity of their usual motions. Pestilence and famine were around them, on the thick and breezy air—in the dark waters, in the deep morass, and in the vaults of the pine forest, the seeds of death were floating—avengers of the luckless tribes, already scattered or enslaved by the iron arm of European war. Oh—how did they pine for the clear streams of Gaudalquivir, or the viney banks of Xeres, for the breezy slopes of the Apuxarras, or the snow clad summits of their native Sierras—those fated followers of the Demon Goid. How did their recollection doat upon the waving palms, the orange groves, the huertas and meads of fair Granada! In vain, in vain!—Of all those gallant hundreds, who had leaped in confidence and hope, from their proud brigantines, upon the glowing shores of Florida, glittering in polished steel, and “very gallant with silk upon silk,” who had traversed the wild country of the Appalachians, who had seen the gleam of Spanish arms, reflected from the black streams of Alabama, who had made the boundless prairies of Missouri ring with the unechoed notes of the Castilian trumpet, who had spread the terrors of the Spanish name, with all its barbarous accompaniments of havoc and slaughter, through wilds untrod before, by feet of civilized man.—Of all those gallant hundreds, but a weak and wasted moiety, was destined to reach the shores of their far fartherland, and that—not as they had fondly deemed, in the pride, the exultation, and the health of conquest, but in want, and heaviness and woe.

The arrows of the Savage, and the yet fiercer arrows of the plague, dearly repaid the injuries that they had wreaked already, on the wretched natives; dearly repaid, too, as it were, by anticipation, the wrongs that their children, and their children's children, should wreak, in long perspective on the forest-dwellers of the west.

There, in that lonely hut, there lay the proud-est spirit, the bravest heart, the mightiest intellect, the favorite comrade of Pizarro—the joint conqueror of Peru!—There lay Hernando de Soto; his fiery energies, even more than the hot fever, wearing away his mortal frame; his massive brow clogged with the black sweat of death; his eye that had flashed the more brilliantly, the deadlier was the peril—dim and filmy; his high heart sick—sick and fearful, not for himself, but for his followers; his hopes of conquest, fame, dominion, gone like the leaves of autumn! There he lay, miserably perishing by inches, the discoverer of a world—a world, never destined to bless or him or his posterity, with its redundant riches.

Beside his pallet-bed was assembled a group of men, the least renowned of whom might well have led a royal army to the battle for a crown. But their frames were gaunt and emaciated, their cheeks furrowed with the lines of care and agony, both of the mind and body; their eyes wet with the scenes of bitterness. The dark cowed priests had administered the last rites of religion to the dying warrior, and now watched, in breathless silence, the parting of his spirit. An Indian maiden, of rare symmetry, and loveliness that would have been deemed exquisite in the brightest halls of old Castile, leaned over his pillow, wiping the cold dew from the conqueror's brow, with her long jetty locks, and fanning off the myriads of voracious insects, that thronged the tainted air! There was not a sound in the crowded chamber, save the heavy sob like breathings of the dying man, and the occasional whinnings of a tall hound, the noblest of his race, which sat erect, gazing with almost human intelligence upon the pallid features of his lord.

Suddenly a light draught of air was perceptible, the silken veil fluttered inwards, and a heavy rustling sound was audible from without. As the huge folds of the banner swayed in the rising breeze, a sensible coolness pervaded the heated chamber, and reached the languid brow of De Soto,

who had lain for the last half hour in seeming lethargy. Heavily, and with a painful expression, he raised himself upon his elbow.

“Moscoso,” he said, “Moscoso, art thou near me?—my eyes wax dim, and it will soon be over. Art thou, for I would speak with thee?”

“Noble De Soto, I am beside thee,” he replied, “say on: I hear and mark thee!”

“Give me thy hand!” Then, as he received it, he raised it slowly on high, and continued in clear and unflinching tones, though evidently with an effort.—“True, friend and follower, by this right hand, that has so often fought beside by own; by this right hand, I do adjure thee, to observe and to obey these my last mandates.”

“Shall I swear it?” cried the stern warrior, whom he addressed in a tone and voice rendered thick and husky by the violence of his excitement.—“Shall I swear it?”

“Swear not, Moscoso!—leave oaths to paltry burghers, and to cringing vassals—but pledge me the unblemished honor of a Castilian noble—so shall I die in peace!”

“By the unblemished honor of a Castilian noble—as I am a born hidalgo, and a belted knight, I promise thee in spirit and in truth, in deed, and word, and thought, to do thy bidding!”

“Then, by this token,” and he drew a massive ring from his own wasted hand, and placed it on the finger of Moscoso, “then, by this token, do I name thee my successor—thou, the leader of the host, and Captain General of Spain! Sound trumpets—heralds make proclamation!” A moment or two elapsed, and the wild flourish of the trumpets was heard without, and the sonorous voice of the heralds making proclamation; they ceased; but there was no shout of triumph, or applause.

“Ha, by St. Jago!” cried the dying chief, “Ha, by St. Jago, but this must not be; ’tis ominous and evil! Go forth, then Jaseo, and bid them sound again, and let my people shout for this, their loyal leader.”

It was done, and a gleam of triumphant satisfaction shot across his hollow features. He spoke again, but it was with a feeble voice.

“I am going,” he said, “I am going, whence there is no return! Now mark me,—by your plighted word, I do command you; battle no farther—strive with the fates no farther—for the fates are adverse! Conquer not thou this region—for I have conquered it, and it is mine! mine, mine, though dying!—Mine it shall be, though dead!—March to the coast as best ye may, build ye such vessels as may bear ye from the main, and save this remnant of my people! Wilt thou do this—as thou hast pledged thyself to do it, noble Moscoso?”

“By all my hopes, I will!”

“Me, then, me shall ye bury thus! Not with lamentations, not with womanish tears, not with vile sorrow, but with the rejoicing anthem, with the blare of the trumpet, and the strong music of the drum! Ye shall sheathe me in my mail, with my helmet on my head, and my spur on my heel!—With my sword in my hand, shall ye bury me—and with a banner of Castile for my shroud! In the depths of the river—of my river—shall ye bury me! with lighted torch and volleyed musketry, at the mid hour of night! For am I not a conqueror—a conqueror of a world—a conqueror with none to brave my arm, or to gainsay my bidding? Where, where is the man, savage or civilized—Christian or heathen—Indian or Spaniard, who hath defied Hernando de Soto, and not perished from the earth? Death is upon me—death from the Lord of earth and heaven! To Him I do submit me—but to mortal, never!”

Even as he spoke, a warder entered the low doorway, and whispered a brief message to Moscoso.—Slight as was the sounds, and dim as hanged the senses of De Soto, he marked the entrance of the soldier, and eagerly enquired the purport of the news!

“A messenger,” was the reply, “an Indian runner, from the Natchez.”

“Admit him—he bears submission—admit him, so shall I die with triumph in my heart.”

The Indian entered—a man of stern features, and of well nigh giant stature. His head, shaven to the chivalrous scalp-lock, was decked with the plumes of the war-eagle, mingled with the feathers of a gayer hue,—his throat was circled by a necklace, strung from the claws of the grizzly bear and cougar, fearfully mixed with tufts of human hair—his lineaments were covered with the black war-paint,—in one hand he bore the crimson war-pipe,

and in the other the well known emblem of Indian hostility, a bundle of shafts bound in the skin of the rattlesnake. With a noiseless step, he crossed the chamber, he flung the deadly gift upon the death-bed of De Soto—he raised the red pipe to his lips—he puffed the smoke—and then, in the wild accents of his native tongue, bore to the Spaniards the defiance of his tribe, concluding his speech with the oft heard and unforgotten cadences of the war-hoop!

As the dying leader caught the raised tone of the Indian's words, his eye had lightened, and his brow contracted into a writhing form! He knew the import of his speech, by the modulations of his voice, his lips quivered—his chest heaved—his hands clutched the thin coverlid, as though they were grappling to the lance or rapier. The wild notes of the war-hoop rang through his ears—and in death, in death itself, the ruling passion was prevalent—manifestly—terribly prevalent!

He sprang to his feet—his form dilating, and his features flushing with all the energy of life. “St. Jago,” he shouted, “for Spain! for Spain!—Soto and victory,” and with an impotent effort to strike, he fell flat upon his face, at the feet of the Indian who had provoked his dying indignation!

They raised him—but a flood of gore had gushed from eyes, mouth, ears—he had burst some one of the larger vessels—and was already lifeless ere he struck the ground!

The sun had even now sunk below the horizon, and ere the preparations for his funeral had been completed, it was already midnight. Five hundred torches of the resinous pine tree flashed with their crimson reflections on the turbid water, as the barks glided over its surface, bearing the warrior to his last home.

A train of cowed priests, with pix, and crucifix, and steaming censor, floated in the van, making the vaulted woods to echo the high notes of the Te Deum—chanted in lieu of the mournful Miserere over the mortal part of that ill-fated warrior.

But as the canoe came onward in which the corpse was placed—seated erect, as he had ordered it, with the good sword in the dead hand, the polished helmet glancing above the sunken features, and the gay banner of Castile floating like a mantle from the shoulders—the pealing notes of the trumpet, and the roll of the battle-drum, and the Spanish war-cry—“St. Jago for De Soto and for Spain!”—and the crash of the volleying aquebuses might be heard, startling the wild beasts, and the wilder Indians, of the forest, for leagues around.

There was a deep pause—a deep, deep pause—a sullen splash—and every torch was extinguished. “The discoverer of the Mississippi slept beneath the waters. He had crossed a large part of the Continent in search of gold, and found nothing so remarkable as his burial place.”

THE NORTH AMERICAN REVIEW has, as we learn, passed into the hands of Prof. Palfrey. It cannot fail, under such guidance, at least, to maintain its well earned reputation, and its truly national character.

We are afraid that, both in respect of this Review, and of the *American Quarterly*, New York hardly does its duty. They both deserve support, as periodicals creditable to our literature—and this city, so lavish of expenditure in other matters, should not be niggard in their support.

From a paper in the last *American Quarterly*, on *National Defence*.

The consideration of the militia force, and of the means of giving it efficiency, without obstructing the recruiting service of the regular army, comes next to be considered. Nor is it of secondary importance, when we have regard only to its own influence upon the defence of our country.

It has been the opinion of officers who have seen service in all parts of the globe, that the mass of the people of the United States furnishes the finest material for a military force, which exists in any part of the world. Yet, as our militia is at present constituted, it has been reasonably doubted, whether its employment upon emergencies has been productive of most good or evil to the military character of our country. The same description of force, which fled at North Point without seeing an enemy; which broke at Plattsburgh upon the first fire; which refused to cross at Queenstown to complete a victory already gained; manned the

weak lines at New Orleans, from which a superior regular force retired completely beaten; and foiled at Plattsburgh, the veterans of the Peninsular wars. It is therefore certain that no reliance can be placed upon the effects a militia force, as at present organized, will produce; for by circumstances not to be predicted, it may either achieve victory, or ensure defeat. This must always be the case, so long as citizens are called on sudden emergencies from their homes, to act as soldiers, and are retained no longer in service than is sufficient to give them a distaste for the profession of arms, without instilling either habits of discipline, or a knowledge of military evolutions. In addition, the demoralizing influence of a succession of calls, which may reach a whole population, is not to be disregarded; for if the moral character of the debased may be raised by the influence of military honor, and curbed by the regularity of military discipline, it is no less true, that a partial acquaintance with the profession of arms, incapacitates for steady civil industry.

The calls for the militia, then, should be of such a nature, that the subject of them must know, that his civil occupations are to be at an end, at any rate, for a term of years, and that his own comforts will be promoted by his acquiring a knowledge of his new business, and at the same time abstaining from the vices which have sometimes been considered the reproach of the life of a camp, but which have never failed to influence a draughted militia.

It is to a military force alone, drawn from all classes of citizens indiscriminately, and officered by the authority of the States, although acting under the call of the general government, that the defence of the country can be safely intrusted. Two ways have witnessed at their close, regular armies dismissed, in the one place without pay, in the other almost with disgrace, and it is not in the nature of things that such events can be repeated without danger. It is calculating too much upon human virtue, to hope that on any future occasion, a large and perhaps successful regular army, shall not be at the beck of its commander, to do whatever he may dictate; nor can it be hoped that if in preponderating force, they will assent to be disbanded, when the purpose for which they are raised is fulfilled. It is far otherwise with a militia force.—However powerfully they may be attached to their standards by patriotism or discipline, a return to their firesides will be a reward instead of a punishment, and the news of a peace will be hailed by such a force with joy, when to regulars it will convey the unwelcome intelligence of their occupation being gone.

That the patriotism of the people of the United States will induce them to bear the fatigues and dangers of military service without a murmur, was fully proved during the late war, in which no small portion of the population was actually called into service. But it is no more than just to such a population, that such a service should be rendered as little onerous as possible, by confining it to the least number of individuals. This can only be done by deciding upon an organization in time of peace, by which the persons to be called upon in case of war, shall be pointed out, and the manner of designating them, and fixing the order of rotation, rendered precise and definite.

The largest call yet made upon the militia, was for 100,000 men, and this may be safely taken as the maximum that can ever be demanded in any future war. In fact the means of concentration at any given point, by the improved modes of conveyance, are so much greater than they formerly were, that a much less force would be needed than was necessary on former occasions. A force of this amount ought to be at once called for by law, although in a time of profound peace, by draughts from militia of all classes and ages, as at present organized; it might be formed into 102 battalions of infantry, organized into 17 brigades. Each battalion should be composed of eight companies or platoons of 32 files, and would make with officers, 800 men. To the 17 brigades should be attached 34 companies of artillery, and as many squadrons of cavalry. The force at first drawn, should be divided according to their ages, into six classes, one of which should be discharged annually. The place of this class, and of all vacancies by death or removal, should be supplied by annual draughts from all citizens between the ages of 20 and 25. The draughts thus constituted should be assembled in the largest body that the nature of the population would admit of, as many times in the year as the militia of the several states is now usually called

ed out, but separate from those not designated by lot, and under the command of the officers designated from the general body for the purpose. For non-attendance at such parades, no other penalty than a pecuniary fine should be imposed. An option should, however, be left to the several States to substitute in whole or in part for draughts from the militia, volunteer corps having a term of service of six years, provided they be officered, and organized in conformity with the war establishment of the United States; say, in battalions of eight platoons, each of thirty-two files, but with the privilege that no more than two-thirds of the number, making a formation of two in depth, should be required to be present, except when called into active service and put upon pay. The laws of the several States give privileges to volunteer corps enrolled for a term shorter than that of the usual military liability, and who equip and arm themselves, which would ensure the creation of an efficient force of this sort, if put under some one general regulation. But such general and uniform regulation is necessary, if we wish to do away the ridicule which is beginning to attach itself to our citizen soldiers. This ridicule, we are sorry to say, is not unmerited, and it cannot be denied that those who have seen service in our trained bands, are far less fitted to make good troops than if they had never donned an uniform. All this reproach may, however, be done away, by making the volunteer battalions permanent, discharging and receiving equal numbers annually, and conferring the privileges due to voluntary service, only upon those who perform it in a corps designated by the State government, in lieu of a drafted militia, as ready to be called at any moment into the general service.—To the sense of pride which our volunteers have exhibited, however mis-directed on most occasions, may be safely committed the care of providing instruction in manoeuvres and tactics. It is otherwise with those called out by draught.—To give these a chance of being speedily rendered efficient when embodied for service, their non-commissioned officers, to the number of fifty-six to each battalion, ought to be kept in pay, and in constant service. These would form a company, which should be commanded by the adjutant of the battalion, who should also be in constant service, and by three other officers of the battalion serving in monthly rotation. In this way a school for military knowledge would be formed for each portion of the militia, by which a knowledge of the duties both of soldier and officer, would be communicated. The expense of such arrangement would indeed nearly equal that of our present military force, but as it would ensure the action of a well appointed army of 100,000 men upon any emergency, it would be more than defrayed for whole years, by the saving which would ensue in a few weeks of war. It would, moreover, furnish a mode of distributing surplus revenues among the States, to which no pretended or actual constitutional objection could apply.

In case of any alarm of war, the whole or any required part of the battalions, might be at once embodied and called into service; first the men whose term of service had not extended to four years, and in case of evasion, the whole. A call of this sort to the extent of twenty-four battalions, would at once set free the whole of the regular force, from the duty of garrisons, and to this the militia battalions ought of course to be devoted until time had been afforded to mature their discipline.

If, upon a call for the active service of the militia, substitutes were accepted, not, however, to enter into the militia, but to be embodied in the regular army, and to serve for the war, a large accession would be at once made to the regular force; and as the demands for substitutes in the militia, and for recruits, would no longer conflict with each other, the filling up of the regular army to the war establishment, might be almost insured by calling the draughted militia into service. The pay, too, of the forced levies of militia, ought not to equal that of the enlisted army, and thus there would be many who would prefer to pass from the militia ranks to those of the standing force.

For an illustration of this part of our subject, we may refer to the histories of the war of the revolution, and of the more recent contest with England. In both of these, it became necessary to embody large draughts from the militia; the consequence was, that the demand for substitutes almost wholly impeded the regular recruiting service, or enhanced the bounties on enlistments to a bur-

themsome extent; and finally the supply of the regular force depended almost wholly upon those persons who, draughted themselves into the embodied militia, could not be accepted as substitutes, but preferred to take the bounty for joining the regular army, to serving without it. It would be impolitic not to accept substitutes, as those who obtain exemption in this way are generally of habits of life which would make them but poor soldiers; and it is still more impolitic to admit such substitutes into the embodied militia itself, and thus cut off the source whence the regular army might be supplied.

[From the Portsmouth Journal.]

# LECTURE ON PRINTING.

Delivered before the Portsmouth Lyceum, by C. W. Brewster.

*The periodical Press—Extensive Printing Establishments—Influence of the Press in increasing Knowledge and advocating the Interests of Mankind.*

The first Newspaper published at regular intervals was issued monthly at Venice, in Italy, about 250 years since. It was called the *Gazetta*—signifying a little treasury of news. The number of copies issued of this paper must have been very limited—for the jealousy of the Venetian government would not allow of the circulation of a printed sheet, so that the *Gazetta* continued to be distributed in Manuscript for more than thirty years. Files of this paper are now extant.

In the whole Chinese empire, although Printing has been so long practised there, but one regular newspaper is published at the present time. It is a sort of court Journal, issued at Peking, and called *Kingpaou*, or the *Messenger of the Capital*.

The Press had been in operation in England nearly a century before a regular periodical was published. In Nov. 1665, the *London Gazette* was issued weekly, and has been published to the present time.

The first newspaper in the British American Colonies, the *Boston News-Letter*, was commenced in 1704. The *Boston Gazette* was commenced in 1719—and the third paper in the Colonies was commenced the same year in Philadelphia, entitled the *American Weekly Mercury*. The first paper in New York was established in 1725—in Maryland in 1728—Rhode Island and South Carolina in 1733—Virginia in 1736—Connecticut and North Carolina in 1755—New Hampshire in 1756—Delaware in 1761—and in Georgia in 1763.

In 1775, there had been 78 different newspapers printed, 39 of which had been discontinued previous to that time—so that at the commencement of the Revolution there were but 39 papers printed in the U. States—and of the number then printed but eight establishments are now in existence.

In 1810 the whole number of newspapers was three hundred and fifty. There are now about one thousand two hundred newspaper establishments in the United States—from which are issued, at a moderate calculation, 100,000,000 printed sheets annually—which, if in one continuous sheet, would reach four times from pole to pole—and if embodied in a book form, would be equal to issuing six volumes as large as the Bible every minute in the year!

The advancement in newspapers has not only been in numbers but in size. The largest paper published about fifty years since, were of the demi size. In about twenty years, some had increased to the super-royal. Within a few years some have grown to the elephant size—and last month a New York publisher presented the public with a full grown mammoth.

We cannot better illustrate one of the causes of the rapid advancement which has been made within a few years in the various branches of morals, than by drawing aside the curtain and disclosing what the Press is doing in one branch—that of Temperance. We shall look only in one office, that of the *Temperance Recorder*, in Albany.—Sixty workmen are there constantly employed—six presses are kept in operation by steam, and six by hand power. Those are in constant operation, and every working minute of the year are throwing out twenty copies of some Temperance publication—each one intended to go forth and do its work in the public renovation. It is not surprising that any hydra, either in the moral or political world, upon which the press can be brought to bear is more easily vanquished now than in former times—for the sixty printers employed in the office to which we have just referred, exert a greater influ-

ence on the public mind, than sixty thousand scribes with their greatest industry, possibly could have exerted 500 years since.

The office of the Harpers, in New York, gives employment to 140 persons. They print on an average an edition of books of the Family Library size, every day in the year. Their expenses are about three hundred dollars per day.

We do not speak of this establishment as standing forth above every other: we do not know but more extensive ones are in operation in our country. At Brattleborough, in our sister state of Vermont, is one which is deserving notice. The printing establishment of Messrs. Fessenden, keeps in operation seven or eight power presses, printing not far from twenty thousand sheets of paper per day. Connected with the establishment is a paper mill at one end, and a book-bindery at the other, so that (like the chrysalis-changing of a vile caterpillar to a beautiful butterfly,) what enters at one end—the cast-off covering of the human body, is by a regular and rapid process brought out at the other extremity, beautiful paper finely printed and bound—a material for a permanent dress of the immortal mind. So rapid is the process by which paper can be made by the power of steam, that rags have been received at that mill in the morning, manufactured into paper and printed before night! The Comprehensive Commentary is now printing at that establishment. When it is completed, it will have consumed fifteen thousand reams of paper.—Think not that the woollen or the cotton manufacturers are the only ones for whose benefit sheep are raised, or cotton imported; for this one work will use up the amount of a thousand bales of cotton in paper—and will require the skins of sixty thousand sheep for its binding!

The most extensive Printing establishment in England at the present time, is that of the 'Society for the Diffusion of Useful Knowledge.' It gives regular employment to thirty-six type foundrymen, seven men damping paper, and 160 compositors.—Besides 15 common presses, two steam engines are employed in driving 18 printing machines, which can throw off from 700 to 1000 impressions each, per hour. There are in the establishment about one thousand works in stereotype, among which are 75 different sets of plates for the Bible. The first cost of these plates was not far from \$1,500,000. The average quantity of paper printed amounts weekly to 2000 reams—equal to half the quantity used in all the twelve hundred newspaper establishments in the United States!

We shall only advert to one more extensive establishment, which is probably the largest in the world, it is the *Royal Printing House at Paris*. It contains a sufficient quantity of types to have standing at the same time 125,000 octavo pages, or 500 volumes of 250 pages each. It consumes about the same quantity of paper annually as the London establishment, and gives employment to three hundred and fifty persons.

Our own country as yet has not made that advancement in the accumulation of books which has been made in the seat of literature in Europe.—The thirty-one largest libraries in the United States contain together only 250,000 volumes, while the same number of libraries in Germany contain 3,300,000! Look at these vast assemblages for a moment—the growth of four hundred years only! If they continue to increase at the same ratio, to grasp their contents, the age of man will again have to be extended to the antediluvian length, and perhaps after all be drowned in a second deluge from the portentous clouds of literature! We have, however, but little to fear. Literature, like trade, will regulate itself. The wheat will be sifted out, and the chaff thrown to the winds.

As it is only by the deprivation of blessings that we are enabled to estimate their worth, let us for a moment contemplate the extinction of the Press at this time, in our land and throughout the world. Yes—open the flood gates of Vandalism, and with the press and types let every printed work be swept to destruction—but not with them the recollection that they ever existed. Let nothing be found for the reading world but such manuscripts as may be purchased of the scribes, or copied by our hands. Although the arts generally might be practised in perfection, the earth bring forth her fruits in abundance, the blessings of life be richly bestowed—yet the Press silent—we can hardly imagine a greater blank! How many among us would be found able, if willing, to pay five hundred dollars for a Bible—or one hundred

for a common octavo—or a ten dollar bill for a school manual! A ten dollar bill? No, we had forgotten ourselves—without the aid of printing, we should have had no bills or banks either! The lawyer would be compelled to study the public laws from the manuscript records of Legislature, or spend the income of years to obtain a copy—not for his library (for none but a prince would presume upon such an extravagance)—but for his strong box, to be watched over and preserved like the miser's gold. Or perhaps when he enters the courts of justice, we should see in his fringed garments, as in Jewish days, the mementos of his legal knowledge. The Divine, instead of having a thousand volumes within his reach for reference, would be far more fortunate than many of his brethren, if the only work he possessed was a whole bible. The physician, deprived of the knowledge he now derives from the world of skilful practitioners of other times, must rely on the oral instructions of his teacher, and make up the rest of his knowledge from his own personal observation and experience. Whatever discoveries he makes in the healing art, will be sure to be his own: for however benevolent his intentions may be, he can find no press to diffuse his discoveries abroad. If a quack invents some pill, which will, as usual, cure every malady, he must be content with taking it himself, if he will venture to, as he will have no opportunity of sending it, like Samson's foxes, scattering fire brands through the land.

With the channels of knowledge closed, men would rapidly verge back to the ignorance of former times. Aristocracy would extend her coveting and domineering hand to the stores of knowledge, and rejoice in being able to keep others in ignorance. Without the press, there would be nothing like the general conveyance of intelligence from one state to another, or from town to town—it could only be from individual to individual. But why talk of State? The system of our government, over so vast an extent of territory, could not be maintained, and the name of State, in its present relations, would soon be heard no more among us. The chain which binds our Union together would be broken—for we are literally bound together by the Press, and the chains strengthened by the jars of opposing parties in politics, produced by its influence:—without this lightening of the cords, our nation might fall into a state of apathy dangerous to its liberties. Without the Press, there could not be a republican system of government maintained over so extensive a territory as the United States—ignorance must unavoidably exist without its enlightening influence—the laws of each State could not be generally understood in other and distant States—jealousies would be continually rising up—acts of violence, and civil war. No!—without the Press, the Republic could not exist;—a Monarch, with standing armies, to keep his ignorant and servile subjects, in awe, is the most we could expect without this bulwark of our liberties.

Due credit has never been given to the Press for the part it performed in the brilliant achievement of our National Independence. It was on the Press that the oppression of the Stamp Act was brought directly to heart: scarcely a newspaper could be found, among the thirty-nine which were then published, which would either willingly or forcibly submit to the imposition of so unjust a tax. The same degree of oppression might have been exercised upon other branches of the Arts, not less sensible of injury, but without the means of arousing the public to a sense of their wrongs, and been meekly borne—but the Stamp Act was bearding the lion in his den! Indignant, he came forth, and shaking his shaggy mane, his roar resounded through the forest, and sympathy for the aggrieved was echoed from every quarter! It can with confidence be said that the newspapers at that time, dressed in mourning, and the place for the British stamp supplied by a Death's Head—distributed generally among the people—did as much in preparing their minds for the Revolution, as a Lafayette, or even a Washington, afterwards did in accomplishing it. Archimedes, in vain glory, boasted that if he had a spot on which to place a fulcrum, he could move the earth! What the ancient son of science proposed in sport to do to the material universe, is now fast doing to the political, scientific, and moral world. A fulcrum has been found!—based on the sunbeams, already has half the world been elevated by its agency—and ere another century, should its influence continue to extend in the ratio of the last twenty years, wisdom will run to

and forth throughout the earth—knowledge will everywhere be increased—and the ennobling principle of Liberty and Equality will be every where inculcated.

If it be true that "Knowledge is Power," it requires no extra keenness of vision to discern this fulcrum in THE PRESS.

**LATER FROM EUROPE.**—By the packet *Sully*, from Havre, we have Paris papers of 1st Sept. and Havre of the 2d, with London dates of the 29th Aug., three days later than before received from the latter place.

There have been troubles in Madrid, of which some particulars have been heretofore given. Tranquility was, however, restored.

In England all eyes are intent upon the breach which now seems inevitable between the Lords and Commons.

In the sitting of the House of Lords on the 27th Lord Melbourne moved the rejection of some of the most significant amendments made to the Corporation bill, particularly that respecting the pecuniary qualifications for eligibility, and that which vested in Aldermen their seats for life. Lords Ellenborough, Haddington, and Lyndhurst, opposed the motion, which was *lost*—89 for it, 160 against it. Lord Melbourne then said, he could not anticipate the assent of the Commons to any of the amendments; and Lord Brougham, in a speech frequently interrupted, spoke of the inevitable rejection of the life clause, which he characterized as odious and fatal.

The bill, with its amendments, was sent down to the Commons on the 28th, but would not be discussed there before the 31st, as it was necessary to reprint it with the Lord's amendments.

Many petitions have already been presented to the Commons, urging them not to give way to the Lords. When the bill from the House of Lords was announced, and the word *amendments* was uttered, loud laughter burst forth from the majority, and the Chancellor of the Exchequer said, "It will be expedient, I think, to postpone the discussion till the bill and amendments are printed, which, cannot well be before Monday. It is impossible to proceed with too much caution in the Municipal Corporation's Bill, for it is the most important measure submitted to Parliament since the Reform Bill. In assenting to the delay which I propose, the House will have time to prepare itself for a calm, firm, but resolute decision on the amendments proposed by the other House." (Loud cheering.)

The Duke of Nemours is in London, and was received with much distinction. The rumor that he intended a visit to the young Queen of Portugal, is contradicted.

Paris seems quiet enough, and little is said in the papers of *Fieschi*, whose accomplices, if he had any, are not yet discovered. A *M. Pepin*, an Ex-Captain of the National Guard, had been arrested on suspicion of having had some connection with *Fieschi*, but had escaped after his arrest. His is the thirty-second instance, says a Paris paper, of the escape of prisoners from arrest. *M. Pepin* subsequently wrote to the House of Peers to say he would surrender himself whenever the period for his trial arrived.

In consequence *M. Gisquet*, Prefet of Police, "tired," says the Havre paper of the 1st Sept., "of seeing prisoners, committed to his charge escape, escaped this morning himself. After a stormy conference with *M. Thiers* he returned home, ordered his carriage, and went off full speed to the country."

*Armand Carrel* is named as a Candidate, at *Toulon*, for the seat in the Chamber of Deputies vacated by the late *M. de Montalivet*.

cated by *M. Bastide d'Isard*. *M. Thiers* was exerting all his influence to defeat *M. C.*'s election.

The Cholera had raged with violence at Algiers. Letters of the 22d August, however, state, that "thanks to the precautions of the medical facilities, the ravages of the Cholera have been less than was feared. From the 10th, the first day of its breaking out, to the 20th August, the number of deaths, civil and military, does not exceed 638.

In the House of Commons, on the 29th, the Chancellor of the Exchequer brought in a bill, which was read once, for the relief of the *Irish Clergy*. This is a provisional bill, to meet the contingency of the possible loss, between the two houses, of the *Irish Church Bill*, in which case the *Irish Clergy* would be left without revenue.

LONDON, 29th Aug.—City 4 o'clock.—Consols for accounts opened at 89 7-8, and closed about the same. They were firm during the whole day.

PARIS, 29th Aug.—The Chamber of Deputies yesterday closed the discussion on the law of the press, and adopted it with almost all the amendments proposed by the Committee. The vote was, for the law 226, against it 153. The security required to be paid in advance, by a daily paper in Paris, was fixed, on the proposition of *Firmin Didot*, at 100,000f. [\$20,000.]

BERLIN, 29d Aug.—Letters from Dantzick state that the garrison of that place turned out on the 17th, at day break, to be reviewed by the Emperor of Russia, who was accompanied at the review by the Prince Royal of Prussia.

Extract of a letter to the Editor, from Havre, dated Sept. 1, received by the Sully:

This is the season when those in the cotton trade should give orders to purchase on your side the water. But we know not what to be at. The article by the last advices was too high to leave any hope of profit here. Our prices have fallen lately, but are still nominally too high to give profit to the manufacturer. Sales now made are on a small scale. The planter is making too much money; there is little chance left for the dealers. The number of ships ordered to Liverpool, which were destined for this port, has depressed that market also. We pause, too, on another account: the twenty-five millions—how, and when, is it to be settled? We can get no satisfactory account of what has been done to put this affair at rest. It is not probable your Government will explain, further than it has done, by approving and publishing the approval of Mr. Livingston's conduct. But it would appear that Mr. Livingston has displeased more than Gen. Jackson in his message; the pique is against him.

I must refer you to the papers for news on Spanish affairs.

FROM RIO DE JANEIRO.—Capt. Chase, of the ship *Mary*, has politely favored us with a file of the *Jornal do Comercio* to the 21st of August. They contain very little news of importance, the columns being chiefly filled with reports of the debates in the general legislative assembly, the principal topics of discussion being a project for the substitution of paper money for the immense quantity of copper now in use, and a series of measures rendered necessary by the recent occurrences at Para.

Some particulars are given of another attempted negro insurrection at Bahia on the 22d of July, a vague notice of which we had previously received, via Buenos Ayres. The insurrection was quelled, after a short time, but the inhabitants were left in a state of great alarm and uneasiness.

The intelligence from Para is not so late as before received.

A general amnesty for political offences, passed on the 19th of June, for the provinces of Minas Gerres and Rio de Janeiro, was extended on the 17th of Aug. to those of Pernambuco and Alagoas

[From the Key West Inquirer.]

LATE FROM CAMPEACHY.—The schooner *Wm. Robbins*, of Baltimore, Capt. Watlington, arrived here on 24th inst. in 21 days from Campeachy.

Capt. W. brings accounts of still farther aggressions upon American property by the authorities of that place. The ship *John*, of Philadelphia, Capt. Holbrook, was seized a few days previous to his sailing, and hardly a vessel arrived that had not a portion, if not the whole, of her cargo confiscated. The brig *Ophir* was still retained in the custody of the government, the captain being the only one belonging to her that yet remained there, the mate and seamen having returned to the United States.

The principal cause of these seizures and confiscations is stated by Capt. Watlington to be, a deficiency in the number of manifests required.—The regulations now in force, and which are stated to be unknown to the Mexican Consuls in the U. States, require from each vessel three general manifests, and three particular manifests for each consignee, and one at least of these three last, must be certified by the Mexican Consul at the port in the United States whence the vessel departs. A trade has been long carried on between Campeachy and others ports in the Gulf and Havana, under feigned clearances from ports of the United States, and although well known to exist, still no steps are taken by the authorities to put a stop to it. The necessary documents are issued in Havana, printed blanks being provided, purporting to be issued at the Custom House at Key West and Apalachicola and the names of the Collectors are attached with all due formality.

FROM KEY WEST.—By the Charleston steamboat, we have Key West papers to September 12th.

The hull of the schooner *Pee Dee*, the loss of which we have before mentioned, was towed into Key West on the 4th or 5th ult. by the schr. *Fair American*. She belonged to one of the minor ports of Carolina.

Key West, Aug. 29.—The case of the schr. United States, Captain Thomas, came up before his Honor Judge Webb on Saturday 29d inst. The decree of the Court awards to the Salvors 50 per cent. of the nett proceeds of sales. The sales amount to about \$1500.

Key West, Sept. 5.—SMACK FAIR AMERICAN.—Fears are entertained for the safety of the Fishing Sloop *Fair American*, as she has not been heard of since the gale of 16th last month, when it is supposed she was on her way to Havana. The persons on board were Daniel P. Tillinghast, of R. I. master; Charles W. Andrews, N. Y.; John S. Scates, Mass.; and T. Allen.

KEY WEST, Sept. 12.—Melancholy Occurrence.—We regret to have to announce the probable loss of Lieut. Gabriel O'Brien, of the Revenue Service, commanding the U. S. Cutter *Washington* on this station. He was blown to sea in a sail boat, and is supposed to have perished.

Shipwreck.—The brig *Mary*, of Boston, Capt. Nehemiah Hill, 30 days from New York, was wrecked on the reef off Key Vacas, on Saturday the 5th instant. The vessel having bilged will be totally lost.

The *Mary* was bound to Mobile with an assorted cargo of considerable value, most of which has been brought to this port, (principally by the revenue cutter *Washington*), and we believe it is but little damaged, having been taken on deck before the vessel bilged.

[From the Journal of Commerce.]

OPENING OF THE PORT OF SINGAPORE TO AMERICAN VESSELS.—It is well known to merchants, that for several years past the question whether American vessels have a right to trade directly with Singapore, has often been mooted, but never so far cleared up affirmatively as to constitute a safe basis of action for ship-owners. Accordingly, for the most part, American vessels have either kept aloof from the trade with Singapore, or have carried it on through the neighboring Dutch port of Rhio. This, of course, was attended with much inconvenience and delay, besides the expense of boat-hire, &c. &c. In one or two instances, American vessels have ventured the consequences of a direct trade; and in one at least, a prosecution was entered, which, although it resulted in favor of the defendant, was nevertheless a source of great inconvenience, and loss, and has, so far as we are aware, effectually deterred others from similar attempts.—

The merchants and people of Singapore have always been favorable to the direct trade; but until the determination of the British government should be known, they were unable to do any thing more than petition for existing obstacles to be removed. We are happy to state that this object is at length accomplished, and that American vessels may now trade directly with Singapore, free from any hindrance or interruption. Information to this effect is contained in a letter of May 7th, from Mr. Balestier, American Consul at Singapore, to a commercial house in this city. We have been favored with the following extract: "I now have the pleasure to inform you that yesterday I received from the governor a copy of a despatch from the Court of Directors in London, saying that inasmuch as Singapore had been united under the same Government with Penang, to which port our vessels had acquired a right to trade by the Convention of 1815, it was right to consider us at liberty to trade here, as well as at the other principal settlements, such as Calcutta, Madras, Bombay and Penang—and so the port is free to us! I have already availed myself of the circumstance, (which by the by, from good authority I had before anticipated,) in favor of the brig *Edwin*, Millett, of Salem, whose cargo I have landed in the port,—there being at the time a King's ship in it, which, so far from vexing, offered me any assistance we might want. This morning the ship *Marmora*, of Boston, arrived from China."

[FOR THE NEW-YORK AMERICAN.]

Musings.—By Flaccus, in the Country.  
TO AN INFANT IN HEAVEN.

"Think what a present we to God have sent."—[Milton.]

Thou bright and star-like spirit!  
That in my visions wild  
I see 'mid heaven's seraphic host—  
Oh! can'st thou be my child?  
My griefs quench'd in wonder,  
And pride arrests my sighs—  
A branch from this unworthy stock  
Now blossoms in the skies!  
Our hopes of thee were lofty—  
But have we cause to grieve?  
Oh! could our proudest, maddest wish,  
A nobler fate conceive?  
The little weeper, tearless—  
The sinner, snatch'd from sin—  
The babe, to more than manhood grown  
Ere childhood did begin.  
Thy brain, so uninstructed  
While in its earthly state,  
Now threads the mazy track of spheres,  
Or reads the book of fate.  
Thine eyes, so curb'd in vision,  
Now range the realms of space,  
Look down upon the rolling stars,  
Or watch their maker's face.  
Thy feeble feet, unsteady,  
That totter'd as they trod,  
With angels walk the heavenly paths,  
Or stand before their God.  
Thy little hand, so helpless,  
That scarce its toys could hold,  
Now clasps its mate in holy prayer,  
Or twangs a harp of gold.  
Nor is thy tongue less skilful—  
Before the throne divine  
'Tis pleading—or a mother's weal,  
As once she prayed for thine.  
What bliss is born of sorrow!—  
'Tis never sent in vain—  
The heavenly surgeon maims to save,  
He gives no useless pain.  
Our God, to call us homeward,  
His darling son sent down;  
And now, still more to tempt us there,  
Has taken up our own.

#### PARTNER WANTED.

Wanted, a partner in an extensive Printing Establishment. No one need apply who is not a thoroughbred printer, competent to superintend and direct an office in which upwards of 30 persons are employed, and able to furnish \$3000 cash capital. The best of references will be given and required. Letters, with real name, may be addressed to P. P. P., Post Office, New-York, postage paid, and they will be promptly attended to.  
May-if

#### TO TUNNEL CONTRACTORS.

Proposals will be received by mail, or otherwise, for excavating a Tunnel on the summit of the Sandy and Beaver Canal. The Tunnel is 900 yards long, the material to be removed is a soft sand-stone rock, the highest part of the ridge through which it passes is about 90 feet above the top of the Tunnel. As the deep cuts at the termination are not excavated, most of the material will have to be removed through shafts. Proposals must be accompanied with good recommendations, as to skill and competency.  
E. H. GILL,  
Engineer.

New-Lisbon, Ohio, Sept. 17, 1838.

## RAILROAD IRON.

200 tons of Railroad Iron of the T pattern, just imported and for sale by  
**HOWLAND & ASPINWALL,**  
 55 South street.

## AMES' CELEBRATED SHOVELS, SPADES, &amp;c.

500 dozens Ames' back-strap and plain Shovels,  
 75 do do round-pointed do  
 150 do do cast steel Shovels and Spades,  
 100 do do Socket Shovels and Spades,  
 150 do do steel plated Spades.

Together with Pick Axes, Churn Drills, and Crow Bars, steel pointed, made from Salisbury refined iron. For sale by his Agents,

**WITHERELL, AMES & CO.**  
 9 Liberty street, New-York.  
**BACKUS, AMES & CO.**  
 8 State street, Albany.

## RAILROAD IRON WORK,

Of all kinds, made to order by **GODWIN, CLARK & CO.,** Paterson, New-Jersey.

**CAR WHEELS, BOXES, AXLES, and CAR SPRINGS,** made and fitted complete, at short notice, and fair prices. Orders addressed to them at Paterson, N. J., or 24 Broad street, N. Y., will meet with immediate attention.  
 Paterson, Aug. 19, 1835. 34—ly

## RAILROAD CASTINGS.

**MANY & WARD,** Proprietors of the Albany Eagle Air Furnace and Machine Shop, will make to order car wheels, chairs and knees, and every other description of castings required for railroads. R-ly feb14

## AUBURN AND SYRACUSE RAILROAD.

## NOTICE TO CONTRACTORS.

Sealed Proposals will be received until the 15th day of October next, at noon, by the undersigned, Chief Engineer and Agent of the Auburn and Syracuse Railroad Company, for the Grading, Masonry, and Bridges on said Road. Individuals disposed to contract for the execution of the whole or any part of the work, will be furnished on application at the Office of the Company in Auburn, with blank forms of proposals, and printed specifications.

The contracts will be formed in the usual manner—a specific price being stated for each item of work, which price is to include the cost of material and labor required in rendering the work complete.

The proposals to be accompanied with the names of sureties, and where the parties are unknown to the undersigned or resident Engineers, the usual certificates of character and solvency will be required.

Individuals who have been employed on other works, must furnish satisfactory recommendations from the Engineer or Superintendents of the same. A rigid adherence to the conditions of each contract will in all cases be required.

It is desired that all the work in each section, including Grading, Culverts, and Bridges, should be embraced in the same contract, and it is requested that the proposals be made accordingly.

The plans of the different structures will be ready for examination at the Office aforesaid, by the 1st day of October next.

**EDWIN F. JOHNSON,**  
 Chief Engineer & Agent A. & S. R. R. Company.  
 Auburn, Aug. 22, 1835. 37—t150

## STEPHENSON,

Builder of a superior style of Passenger Cars for Railroads.

No. 264 Elizabeth street, near Bleecker street, New-York.

**RAILROAD COMPANIES** would do well to examine these Cars; a specimen of which may be seen on that part of the New-York and Harlem Railroad now in operation. 223 of

## RAILROAD CAR WHEELS AND BOXES AND OTHER RAILROAD CASTINGS.

Also, **AXLES** furnished and fitted to wheels complete at the Jefferson Cotton and Wool Machine Factory and Foundry, Paterson, N. J. All orders addressed to the subscribers at Paterson, or 60 Wall street, New-York, will be promptly attended to.

Also, **CAR SPRINGS.**

Also, **Flange Tires** turned complete.

Is **ROGERS, KETCHUM & GROSVENOR**

## PATENT RAILROAD, SHIP AND BOAT SPIKES.

The Troy Iron and Nail Factory keeps constantly for sale a very extensive assortment of Wrought Spikes and Nails, from 3 to 10 inches, manufactured by the subscriber's Patent Machinery, which after five years successful operation and now almost universal use in the United States (as well as England, where the subscriber obtained a Patent,) are found superior to any ever offered in market.

Railroad Companies may be supplied with Spikes having countersink heads suitable to the holes in iron rails, to any amount and on short notice. Almost all the Railroads now in progress in the United States are fastened with Spikes made at the above named factory—for which purpose they are found invaluable, as their adhesion is more than double any common spikes made by the hammer.

All orders directed to the Agent, Troy, N. Y., will be punctually attended to.

**HENRY BURDEN, Agent.**

Troy, N. Y. July, 1831.

Spikes are kept for sale, at factory prices, by I. & J. Townsend, Albany, and the principal Iron Merchants in Albany and Troy; J. I. Brower, 239 Water street, New-York; A. M. Jones, Philadelphia; T. Janviers, Baltimore; Degrand & Smith, Boston.

F. S.—Railroad Companies would do well to forward their orders as early as practicable, as the subscriber is desirous of extending the manufacturing so as to keep pace with the daily increasing demand for his Spikes.

1232m

H. BURDEN.

## TO CONTRACTORS FOR EXCAVATION AND MASONRY.

**PROPOSALS** will be received at the Office of the Philadelphia and Reading Railroad Company, in Philadelphia, on the 15th and 20th days of October next, for the Grading and Masonry, of about sixteen miles of the Railroad between Pottsgrove and Norristown.

In this distance, a large amount of heavy work, deserving the attention of skillful and competent Contractors, is to lot. The Jobs of most magnitude, are a Tunnel 600 yards long, and a Bridge across the Schuylkill, near Phoenixville.

Plans and profiles of the line, and drawings of the different constructions on it will be exhibited, and all other information in relation to it will be afforded, on application: at the Engineer's Office, at Pottsgrove, for ten days previous to the letting.

**MONCURE ROBINSON, C. E.**  
 Philadelphia, Sept. 2, 1835. s2 3awt019

## LOCK GATES, FOR CANALS.

**DAVID WILKINSON**, of Cohoes, Albany county, State of New-York, have obtained Letters Patent for the United States for an improvement in Lock Gates, &c., invites the attention of engineers and constructors to his invention, the result of thirty years' practical experience. The chief feature of his invention is the SELF-ADJUSTING VALVE GATE, which is opened in a great degree by the FORCE of the water, and is closed by the weight of the valve gate, rods and screws, and kept secure and close by a pall; the improvement requiring very little force, in aid of the power of the water, to raise the valve gate. The Lock Gate is kept perfectly tight, or free from sagging, by the method of adjusting the anti-friction roller upon the quadrant or circular railway. By means of a thimble on the capstan, the chain for moving the gate can never become tangled or ride on the capstan, and by means of a pall in the head of the capstan, it can never be turned the wrong way, thus effectually guarding against much danger.

There is a lock in operation at Hogsburgh, New-York, where the experiment has been fully tested, to the satisfaction of all scientific men who have viewed it, and which has a self-adjusting valve gate, opening an aperture five feet in length, by 18 inches in width, under a pressure of 84 feet lift.

Having transferred the Letters Patent to Mr. JOHN L. WILKINSON, canal contractor, rights to construct under the same, may be obtained from him by applications addressed to Cohoes P. O. Competent workmen to construct the gates and put them into operation, will be supplied, if desirable, either by the inventor or the assignee.

The following letter, from Judge WATSON, of New-York, one of the most experienced engineers in the United States, is conclusive with respect to the character of this gate:

"Moulinette, (U. Canada,) Aug. 14, 1835.

"DEAR SIR: I have here witnessed a trial of a new paddle gate invented by David Wilkinson, Esq., for Locks, to be introduced into the gates. It is 5 feet long, by 18 inches wide; and I am certain it is the best improvement of the kind which has been tried in this country. I think it will not get out of order, and is so simple, that a 12 years' old boy will open it; and there is no danger of throwing persons into the lock, from the operation, as nothing of the kind can happen.

"I think you will be much pleased with it. It applies its use to any head which can be used in locks, and is more particularly superior in the gates of the lock, to fill and empty rapidly, as easy as you please.

"I am, very respectfully, dear sir, your obedient servant,

"**BENJ. WRIGHT.**

"To **EDWARD P. GAY, Esq.,**

"Civil Engineer, Lancaster, Pa."

To which is added the testimonial of J. B. MILLS, Esq., Engineer, who has been associated with the greatest works of internal improvement in the Union:

"Mr. Wilkinson has recently invented a VALVE for Lock Gates, which is undoubtedly of great value, and readily applied. Mr. W. has the contract for constructing the Lock Gates upon the St. Lawrence Canal, (which is the largest upon this continent,) where it is determined to adopt his valve, and his manner of working the same. Having the utmost confidence in Mr. W.'s valve, having seen it applied, I most confidently commend it to all those interested in the construction of Canal Locks.

"J. B. MILLS,

"Engineer St. Lawrence Canal.

"Cornwall, (U. C.,) Aug. 21, 1835."

## NEW-ORLEANS AND NASHVILLE RAILROAD.

## NOTICE TO CONTRACTORS.

The New-Orleans and Nashville Railroad Company having decided to place under contract the first fifty miles of the Road, on the 15th day of December next, Proposals will be received at their Office, in the City of New-Orleans, from the 15th of November to the 15th day of December next, for the Grading and Bridging of the same.

The Superintending Engineer, R. S. Smith, will be upon the ground to give every explanation relative to the manner of making Proposals, and such other information as may be required.

Of persons not personally known to the Engineer, there will be required certificates of character and qualifications. This part of the road, extending along the shore of Lake Pontchartrain, is perfectly healthy throughout, and being the commencement of the most extensive work in the world, it cannot fail to be of great importance to Contractors to identify themselves with the work at its commencement, as those who are known to the Company as responsible and efficient will certainly be preferred to strangers during the future progress of the road.

The country through which the line passes is generally high pine ridge, and perfectly healthy.

H. J. RANNEY,

Chief Engineer N. O. & N. Railroad. Engineer Office, N. O. & N. Railroad, Aug. 25, 1835. 37

## TO TUNNEL MINERS, DRILLERS, &amp;c.

Wanted, immediately, 40 Tunnel Miners, (Cornish Miners will be preferred,) 80 Drillers, 50 Laborers, and two experienced Mine Blacksmiths, on the New York and Harlem Railroad, about five miles from the City. Liberal wages will be given, and cash payments made every fortnight. Apply at Mr. FOWLER'S, St. John's Hall, Frankfort street, New-York.

**JOHN BUTTER, Contractor.**

The Albany Argus, Philadelphia U. S. Gazette and Pennsylvania, will please copy this, and send their bills to the Railroad Company, 14 Wall street, New-York. 23—1f

## PATENT HAMMERED SHIP, BOAT, AND RAILROAD SPIKES.

Railroad Spikes of every description required, made at the Albany Spike Factory.

Spikes made at the above Factory are recommended to the public as superior to any thing of the kind now in use. Ship and Boat Spikes made full size under the head, so as not to admit water.

Orders may be addressed to Messrs. **ERASTUS CORNING & CO.,** Albany, or to **THOMAS TURNER**, at the Factory, Troy, N. Y. sep.12-ly

## RAILWAY IRON.

250 tons of 1 inch by 1 inch,	Flat Bars in lengths of
200 do. 1 1/2 do. 1 1/2 do.	14 to 15 feet, counter sunk
40 do. 1 do. 1 do.	holes, ends cut at an angle
800 do. 2 do. 2 do.	of 45 degrees, with splitting
800 do. 2 1/2 do. 2 1/2 do.	plates and nails to suit.

soon expected. 250 do. of Edge Rails of 36 lbs. per yard, with the requisite chairs, keys and pins.

Wrought Iron Rims of 30, 33, and 36 inches diameter for Wheels of Railway Cars, and of 60 inches diameter for Locomotive wheels.

Axes of 24, 28, 32, 34, and 36 inches diameter for Railway Cars and Locomotives of patent iron.

The above will be sold free of duty, to State Governments and Incorporated Governments, and the Drawback taken in part payment.

A. & G. RALSTON.

9 South Front street, Philadelphia. Models and samples of all the different kinds of Rails, Chairs, Pins, Wedges, Spikes, and Splicing Plates, in use both in this country and Great Britain, will be exhibited to those disposed to examine them. d7meowr

## SURVEYORS' INSTRUMENTS.

Compasses of various sizes and of superior quality warranted.

Leveling Instruments, large and small sizes, with high magnifying powers with glasses made by Troughton, together with a large assortment of Engineering Instruments, manufactured and sold by

**E. & G. W. BLUNT,** 154 Water street, corner of Maiden lane.

## SURVEYING AND ENGINEERING INSTRUMENTS.

The subscriber manufactures all kinds of Instruments in his profession, warranted equal, if not superior, in principle of construction and workmanship to any imported or manufactured in the United States; several of which are entirely new, among which are an Improved Compass, with a Telescope attached, by which angles can be taken with or without the use of the needle, with perfect accuracy—also a Railroad Goniometer, with two Telescopes—and a Leveling Instrument, with a Goniometer attached, particularly adapted to Railroad purposes.

**WM. J. YOUNG,**

Mathematical Instrument Maker,

No. 9 Dock st., Philadelphia.

The following recommendations are respectfully submitted to Engineers, Surveyors, and others interested.

Baltimore, 1833.

In reply to thy inquiries respecting the instruments manufactured by thee, now in use on the Baltimore and Ohio Railroad, I cheerfully furnish thee the following information. The whole number of Levels now in possession of the department of construction of thy make is seven. The whole number of the "Improved Compass" is eight. These are all exclusive of the number in the service of the Engineer and Graduation Department.

Both Levels and Compasses are in good repair. They have in fact needed but little repairs, except from accidents to which all instruments of the kind are liable.

I have found that thy patterns for the levels and compasses have been preferred by my assistants generally, to any others in use, and the Improved Compass is superior to any other description of Goniometer that we have yet tried in laying the rails on this Road.

This instrument, more recently improved with a reversing telescope, in place of the vane sights, leaves the engineer scarcely any thing to desire in the formation or convenience of the Compass. It is indeed the most completely adapted to lateral angles of any simple and cheap instrument that I have yet seen, and I cannot but believe it will be preferred to all others now in use for laying of rails—and in fact, when known, I think it will be as highly appreciated for common surveying.

Respectfully thy friend,

**JAMES F. STABLER,** Sup't of Construction of Baltimore and Ohio Railroad.

Philadelphia, February, 1833.

Having for the last two years made constant use of Mr. Young's "Patent Improved Compass," I can safely say I believe it to be much superior to any other instrument of the kind, now in use, and as such most cheerfully recommend it to Engineers and Surveyors.

**E. H. GILL,** Civil Engineer.

Germantown, February, 1833.

For a year past I have used Instruments made by Mr. W. J. Young, of Philadelphia, in which he has combined the properties of a Theodolite with the common Level.

I consider these Instruments admirably calculated for laying out Railroads, and can recommend them to the notice of Engineers as preferable to any others for that purpose.

**HENRY R. CAMPBELL,** Eng. Philad.

Germantown, and Norristown Railroad

## AMERICAN RAILROAD JOURNAL.

NEW-YORK, OCTOBER 17, 1835.

We ask the attention of our readers to the communication of "A New-York Citizen," in this number of the Journal, in relation to *Railroads*. We have been long convinced, as this work will bear witness, of the importance, and peculiar fitness, of Railroads for the business and enterprize of this country—and we are now more than ever satisfied that they will yet pervade, not only *every State*, but also almost every *county and town*, in the Union.

[For the American Railroad Journal.]

## RAILROADS.

\* The construction of Railroads is becoming a subject of great importance to the citizens of these United States, but to none more so than to the citizens of this City.

Almost every day tells us of new undertakings; Railroads are in progress from the North to the South, from this City to the Lakes, and others are contemplated from Boston to the Far West, from New-Orleans, more than 500 miles, to Nashville, and, (if successful, who can say that it may not ere long reach the Rocky Mountains? nay, even the Pacific Ocean?

In the mean time, Railroad Stocks have become abundant, and a large amount of capital has been invested in them by New-Yorkers. These Stocks, also, like the

Roads themselves, are daily on the increase.

Should Railroads prove successful in this country, it will be not only difficult to conceive, but impossible to describe, the benefits resulting to this City; then, also, will the holders of these Stocks prove to have made a wise investment. On the contrary, should Railroads prove unsuccessful and unprofitable in the United States, then will not merely disappointment follow to the country and towns through which they pass, but loss and ruin will fall to the lot of many of our enterprising and industrious citizens, who become holders of the Stock.

On the question, therefore, whether Railroads are or are not calculated to benefit this country, and the Stockholders, it behooves this community to reflect maturely, if possible, to form a correct decision, and to act conformably thereto.

If these undertakings are to fail, no time should be lost by intelligent and patriotic citizens in forewarning this community of their danger.

On the other hand, if they are to afford the benefits and profits held out to the public, then are they entitled to the countenance, encouragement, and patronage of all classes of men.

The writer can only give to this important subject a passing and superficial notice, in the hope of inducing skilful and experienced men to advise the public correctly. Judging from general principles, he has, however, for himself, arrived at the conclusion, that *this is the country for Railroads*, and that *wherever judiciously located, and managed with skill and economy, they will not fail to prove successful*.

Our country has been formed by the God of Nature, upon a large and magnificent scale,—her Mountains, her Plains, her Forests, her Prairies, her Lakes and her Rivers, are large and far between. The extent and distance of these from each other, and from our numerous and important sea

ports, point out this as the *Country for Railroads*.

The Political situation of the United States also leads to the same conclusion, formed of 24 Independent States, having separate seats of government, united under one confederated government, seems to point to the quick and easy communication by Railroads as, providentially adapted to their peculiar situation.

In the quantum of transportation also the products of our forests, our agriculture, our mines, of commerce, of raw materials and manufactured goods, form a sum total, large indeed, but increasing almost beyond calculation.

Finally, it would seem that the disposition and pursuits of the American people, render the construction of Railroads proper, and can scarce fail to make them profitable. They are a people actuated by the spirit of enterprize, activity, and trade; influenced in their habits by the rapid changes around them, in a country whose rapid population and sudden prosperity, beggars the page of history, time is prized by our citizens, as of more value in a peculiar point of view, than by any other people,—here delay is brooked with impatience, and increased speed paid for liberally by the impatient traveller.

So far as the writer can judge, *experience*, also, indicates that our Railroads will succeed; no failure of any one has yet come to his knowledge.

Perhaps the best tried experiment on record is the Liverpool and Manchester Railroad, which in despite of Canal competition, has, according to a recent statement in the newspapers, divided 9 per cent. per annum, and notwithstanding the predictions that the wear and tear of the road, engine and cars, would render the investment a bad one for the stockholders, the stock is now quoted at 200 per cent.

It is true that it may be said all this has been done in old England, but that in this

country we can have no Road to compare with the great Liverpool and Manchester Railroad. The writer would be happy were it in his possession to lay the results of all the Railroads in this country, so far as ascertained, before the public, believing that they would generally bear a respectable comparison with the great Liverpool and Manchester Railroad.

Unfortunately, he has one only which it is in his power correctly to state by way of comparison, viz., the Boston and Worcester Railroad. This Road somewhat exceeds in length the Liverpool and Manchester Road, but has thus far been even more successful.

At the time when the Road first became passable throughout, two per cent. dividend was made from the earnings up to that period. During the quarter just passed, its receipts have been \$56,000, the expense during the same time (independent of further completion of the Road paid from a surplus of the Capital before unexpended) are short of \$15,000; leaving a net profit remaining of \$41,000, on a capital of \$1,250,000, being over 3 per cent. for 3 months.

This Road (which has a certain prospect of great increase) shows, by the result, what the writer believes that all the other Railroads of this country demonstrate, viz.—that they will be even more beneficial and productive here than in any other country. He is unwilling to believe that his countrymen, who excel all other people in Commercial enterprise, in constructing and managing the finest Ships of War, Foreign Packets, Coasting Packets, and Steamboats, will not also excel all other people in Railroading.

Also, on the subject of the comparative safety of these, compared with other Stocks, it is worthy the consideration of Capitalists inclined to invest in them, that they cannot, like Marine Stocks, be reached by storms, like Fire Stocks, by conflagration, or, like Bank Stocks, be subject to depredation, or laid under contribution by any invasion.

It must not be forgotten that the United States have become one of the principal commercial and maritime nations of the earth, and that among maritime nations, wars must occur; now when war comes (as come it must) even out of our growing prosperity, will it not prove the wisdom of this people to have a country like this intersected by Railroads? For then the tremendous resources of this extensive country could be brought almost with the speed of the wind to defend any point of attack.—Provided the writer is correct in his conclusion that this is the country for Railroads, it seems to follow that the investments in them are not only safe from loss to the community, but that they will, like our Western Canal, become solid capital, beneficial to the Public, and profitable to the Stockholders.

—A NEW-YORK CITIZEN.

**GREAT INTERNAL IMPROVEMENT CONVENTION.**—This Convention will be held at *Utica*, on the 11th day of November next.—We hope every section of the State will be represented. The State of New-York gave the first grand lead, by the Erie and Champlain Canals; and since that time, she has halted. Did this first sublime effort exhaust her powers? Look at the immense income which these works are now yielding—an income that, with a tithe of the enterprise we once possessed, would induce an expenditure of ten millions per annum, until all the great avenues which nature has prepared for us are perfected throughout the State. We approve of the remarks in one of our city papers that nothing sectional should enter the feelings or deliberations of this body. That men should be chosen who will extend their views over the whole State—and that there the question should now be settled, whether internal improvements should end, or whether the benefits which have flown in upon us so abundantly from what we have done, should induce us to finish the plan of the first great undertakers. Those who will look back, and examine the views of Governor Clinton, will see that what has been done is only a part of his great project. We have, it is true, formed connections between the tide waters and the Susquehanna at various points; while the Allegany, a much more important river, has been totally neglected.

The southern range of counties have realized comparatively nothing from the expenditures of government—the northwest is capable of great improvements, and many other parts of the State.

Other States are securing to themselves a trade which nature assigned for us, which improved roads and canals would have secured to us exclusively forever. Their enterprise and wisdom has already taken from us a great and important trade in the West, which we have forfeited by our supineness. The proposed Convention must determine whether we shall suffer nearly the entire trade of the West to go to other cities, or whether we shall now awake from our long sleep, and engage in earnest to retrieve, in time, at least some portion of what our apathy has lost.

**ERIE AND KALAMAZOO RAILROAD.**—This road, for which a charter was granted by the Territory of Michigan, will extend from *Toledo*, on the *Maumee*, through *Adrian*, and terminate at the mouth of the *Kalamazoo*, on *Lake Michigan*. The first section of 30 miles, from *Toledo* to *Adrian*, is in course of construction, and will be completed early next spring—six to eight miles are now nearly ready for use.

We hope soon to receive further and more particular information in relation to this road.

The proceedings of the Board of Assistant Aldermen, on Tuesday evening, were of unusual interest. Resolutions were offered by Mr. Van Schaick re-

specting the enlargement of the *Erie Canal*, and in favor of aid from the State to the *New York and Erie Railroad*. The deep interest of this city in both these lines of communication, amply justifies this step, which, it is fair to presume, both houses will adopt. The only reasonable explanation, indeed, as it seems to us, of the apathy manifested by our citizens to these two projects, is that of the actual prosperity of all branches of business, which—keeping every body busy with the present—leaves little leisure for the contemplation of the future.

While, however, we are thus reaping the actual harvest, competitors elsewhere, are busy to secure for themselves a portion of this prosperity in time to come, and unless we look about us a little, we may find, when it is too late, that although New York cannot be made to go back, she may cease to go forward, in the progress of wealth, population, and influence, as rapidly as lately she has done.

Ald. Van Schaick offered the following resolution:

Resolved, if the Board of Aldermen concur, that his Honor the Mayor be requested to transmit to the Canal Board, through the Comptroller of this State, copies of the following resolutions:

Whereas the prosperity of this city is derived exclusively from its advantageous situation as a great commercial mart, forming by its proximity to the ocean, its navigable rivers running far into the land, and by the *Erie Canal*, the most important link in the chain which connects our coasting and foreign trade with the growing commerce of the lakes:

And whereas the most persevering and sagacious efforts are continually made under the impulse of the enlightened Councils of neighboring States to divert from the city of New York the advantages resulting from her intimate and ready intercourse with the fertile and productive regions of the West—and since it has become manifest that our maritime and commercial superiority so far as they depend upon our inland trade, can be best preserved by decisive measures founded upon an enlightened and liberal policy; and as the facility and cheapness of the transportation of passengers and merchandize is the great point to be gained, and upon which the ultimate direction of the largest portion of the trade of the lakes must depend:

And whereas the line of Rail-Road from *Boston* to *Albany* is intended to divert a portion of our trade to *Boston*—Therefore be it resolved, that this Common Council regard with unqualified approbation, the design of the Act of the Legislature of May 11, 1835, authorizing the enlargement and improvement of the *Erie Canal*, and the doubling of its locks, the final determination upon which and in relation to its dimensions is left to the judgment and discretion of the Canal board.

Resolved, That the said enlargement should be projected upon a scale which shall only be restricted in its extent by the ability to combine in the construction of Canal Boats, the greatest amount of transportation with the greatest facility and despatch of business.

Resolved, That unless there are strong objections to the employment on the canal of the largest size of boats arising out of the increased difficulty of their traction, the Common Council recommend that the canal be enlarged to 90 feet in width of water at the surface and 8 feet in depth, so as to carry boats of 120 tons burthen; and in relation to a measure so vitally important, the consideration of the amount of money the improvement may cost, should not be entertained, since if the canal is enlarged to the extent proposed, vessels will be built competent to the navigation of the *Hudson*, and which will discharge their cargoes in this port and harbor without incurring the expense and loss of time consequent upon unloading and transhipping their cargoes between *Buffalo* and *New York*.

Resolved, That copies of the following resolutions be transmitted to those gentlemen who shall belong to the next Legislature from the first Senatorial District.

Whereas, the Mayor, Aldermen and Commonalty of the city of New-York have not the right expressly given them by their charter or by law to loan money to incorporated companies, or to purchase their stock; but as it is expected that the

constituted authorities of the commercial emporium shall be vigilant in promoting the public interests, and shall afford such encouragement to great designs, having for their object the development of trade and industry as may be consistent with their appropriate duties and the limited nature of their powers, and as the construction of a rail road from New-York direct to Lake Erie is a measure which when completed will, together with the improvement of the Erie Canal, insure the absolute superiority of this city against all competition.

Therefore, be it Resolved, That this Common Council do regard the proposed New York and Erie Railroad as an undertaking of the highest importance to the prosperity of this City and District, as well as the sections of the State through which it is intended to pass, and they therefore respectfully request the representatives of the people in the Legislature from the First District, to use all their influence in promoting the completion of that work, either by inducing the State to become the proprietors thereof, or to loan to the Company the credit of the State to such reasonable amount as the said Company may be able to assure the ultimate payment of by the most satisfactory security.

Ald. Van Schaick accompanied these resolutions with a few remarks on the importance of the object contemplated, and adverted to the efforts making by Pennsylvania and the Canadas to draw off our trade; and directed the attention of the Board to the contemplated railroad from New-York to Albany, on which alone New-York can depend to prevent the Albany and Boston railroad from carrying off our winter trade. He read some resolutions lately passed at Rochester, on the subject of widening the Erie Canal, and doubling its locks; and also, resolutions passed at Faneuil Hall, in Boston, in favor of a railroad thither from Albany.

The resolutions were laid on the table and ordered to be printed.

**RAILROAD BARS.**—We find in the London Mechanics' Magazine, the following remarks in relation to a mode of avoiding the jar which occurs in passing over the pedestals, or supports, of the rail.

**RAILROAD BARS.**—Sir: I have not hitherto directed particular attention to railroads, but as I read Mr. Daglish's letter of the 26th May, an idea occurred to me, which I am induced to offer, through your columns, to the consideration of those connected with great undertakings of that kind. I will put my idea as a question:—Is it not possible to produce a railroad with uniform elasticity, or, at least, so nearly so as to avoid the inconvenient and injurious jar experienced while the wheels of a carriage are passing over the pedestals and joints?

To effect this, I propose that the ends where the different portions of the rails meet should have corresponding notches to admit keys, for the purpose of keeping all fair at top. These keys might be extended to the rails on both sides of the road, to keep them parallel and at a uniform distance. The vertical joints where the ends of rails meet to be open, to allow for expansion; and for the same reason also, the vertical joints at the sides of the keys. Horizontally the keys to be as tight as possible in the rails. The rails are to be kept in their vertical position by the mortices in the chairs, and to be fastened down to them by the keys. Each portion of the rails is not to rest on the bottom of the mortices in the chairs, but upon a transverse bar or bars, whose strength and bearing are to be precisely that which will produce the same degree of elasticity as that of the rails, that is, if the wheels of a waggon were passing immediately over these bars, or the keys in the joints of the rails, there would be no more tendency to jar than if they were rolling on the rails in the middle between any of the supports.

This idea may be applied to a great many, or all the variety of forms for the

rails; but I think with Mr. Daglish, that the rails, from their upper to their under surface, ought to be as little as possible. And, indeed, to produce steadiness in motion, the centre of gravity of a train of carriages, and the goods they contain, cannot be kept too low.

I am, sir, your obedient servant,  
JOSEPH JOPLING.

31, Somerset-street, July 11, 1835.

**THE LEXINGTON.**—We observe in the London Mechanics' Magazine for August, an account, by "an American," of the *Steamboat Lexington*, which was constructed for, and under the direction of, Capt. VANDERBUILT of this city, rating her at 20 miles per hour, and calling her "the fastest vessel in the world."

This communication called out several others in reply, from which we select the two following, and would ask from Capt. Vanderbilt, or some one else, a drawing, and such a description as will put the matter at rest, to the satisfaction and credit of all concerned.

Extract from a communication in the London Mechanics' Magazine, signed "James Bairstow."

**THE AMERICAN "FASTEST VESSEL IN THE WORLD."**—Sir: As the account sent you by "an American," of the *Steamboat Lexington*, and inserted in your journal of Saturday last, does not explain with sufficient clearness the peculiar mode of construction by which she has been enabled to accomplish a degree of speed, hitherto quite unrivalled, and by many deemed utterly unattainable, your readers may be, perhaps, pleased to receive from another American some further particulars on the subject. I have not myself seen the *Lexington*, but my information respecting her is from a good source.

**THE AMERICAN "FASTEST SHIP IN THE WORLD."**—Sir: I have read an extract from an American paper, in your last Number, p. 384, giving an account of the trial of the *Lexington steamer*. I do not quite understand the construction of her deck; and should be glad to receive further information by a sketch in your Magazine. Neither do I comprehend how she could move at the rate of 20 miles an hour, seeing the greatest velocity of her paddle-wheels is but 19.7064 per hour. Perhaps your printer made the error, in stating the diameter of the wheel at 24 feet; surely it should have been 34 or 42 feet: it is in vain to expect an engine with a stroke of 11 feet to make more than 23 per minute; indeed, this speed for the piston is greater by far than is usual in England; so that the speed of the vessel must be attained by increasing the diameter of the wheel.

Under this idea, I do hope your correspondent will write for a more detailed account of the *Lexington* and her engines, for at present she looks a "trifle slanting-dicular." At the same time, I am ready to acquit your correspondent of any personal intention of misleading your readers.

I am, Sir, yours truly,  
W. THOROLD.

Norwich, August, 22, 1835.

Sir: Having read in your valuable journal for August 15th, an account of the "fastest boat in the world," I was induced to look minutely into the description given;

and upon comparing the diameter of the wheel with the number of strokes mentioned, I find that the speed of the boat (which is stated to be twenty miles per hour) is two miles an hour faster than the motion of the periphery of the wheel!

Now, Mr. Editor, I take upon myself to say, that no steamer in this country has approached, within some miles, the speed of the diameter of the wheels. The "*Diamond*," "*City of Canterbury*," and "*Star*," now running in the Thames, are no doubt the three fastest boats in Europe; the speed of these boats, is as near as possible, thirteen geographical miles per hour, during which time the periphery of the paddle-wheels moved seventeen miles, travelling four miles per hour faster than the vessel.

Now in the description of the "fastest boat in the world," the diameter of the wheel is given at twenty-four feet, and the speed twenty-one to twenty-three strokes per minute; I have taken the mean of twenty-two strokes per minute; this gives, for the speed of the wheels, eighteen miles per hour, and deducting four miles, as is the case with the three boats before mentioned, will leave fourteen miles per hour; but I will not allow the Americans even this speed, for two reasons; first, it will be observed that I have founded my previous observations upon three of the fastest, as well, perhaps, as the best boats in this country, both as regards engines and construction, which is the reason that the speed of these boats approaches so near the speed of the wheels; for if the average of thirty boats on the Thames be taken, we shall find that the wheels are often going fifteen miles an hour, while the boats are going only ten miles. Again, the lumber, which is used in American boats, and called steam engines, can never be compared with the engines as now manufactured by our first-rate makers, either for lightness, safety, or effective force. Taking all these facts into consideration—facts which are well known to scientific men in this country—I think we may allow the American boats a speed approaching thirteen miles an hour, and not more; and this speed is not produced by the eleven-feet stroke or the arched deck and beams, but from the simple fact of her enormous length, as compared with her beams. Vessels of this class may do very well for the large rivers of America, but never would do for sea service, or for the rivers of this country.

As I find in your last number, another American has been giving his countrymen a fillip, by endeavoring "to explain more clearly than your former correspondent has done, why this boat has attained this wonderful speed," but which explanation only shows the manner in which she is trussed longitudinally; perhaps he will now have the goodness to explain, why in America steam ships go faster than their wheels, while in all other countries they generally go from one third to one fourth slower.

I am, Mr. Editor,  
Your obedient servant,  
FANQUI.

**LIVERPOOL AND MANCHESTER RAILWAY.—Seventh Half-Yearly Meeting.**—The Directors reported a continued increase in the traffic, as compared with the corresponding six months of last year. The receipts of the half year ending 30th of June, amounted to 99,474l. 16s. 6d., and the expenses to 61,814l. 6s. 1d., leaving a net profit for six months of 37,660l. 9s. 10d. A dividend of 4l. 10s. per share (for the half year) was resolved upon. The shares are now quoted at 200l.

To the Editor of the Railroad Journal:

I perceive, sir, in your Journal of the 3d inst., a reference to an improvement made by Mr. Force, of Baltimore, in the construction of "Railroad Axles."

If I understand your description of it, the axle can be repaired when the journals become worn, without removing the wheels, and without putting the journal into the fire. If this can be done, a very considerable expense will be saved to a company which has many cars and carriages in use—but there is some doubt in my mind as to the feasibility of effecting such repairs in the manner proposed; and I would call to it the attention of practical men.

Yours, truly,

A STOCKHOLDER.

We shall endeavor to satisfy, not only "A Stockholder," but many stockholders, of the facility with which the journals of axles may be repaired in the manner proposed.—[Ed. R. R. J.]

THE BRISTOL AND GLOUCESTERSHIRE RAILWAY (from Bristol to the great Westerleigh coal-field) was opened on the 6th inst. It is 9 miles long; and the cuttings and embankments are supposed to be greater than on any railway of similar extent which has yet been formed. There is a tunnel (under Staple Hill) 1,540 feet long, 12 wide, and 16½ feet high; it is in a straight line, 3 shafts by which the excavations were carried on being left open to admit light. One of the embankments is 56 feet in height. The capital expended on the undertaking is about 77,000*l*. The Act was obtained in June, 1828, and the works were commenced in June, 1829. Mr. Townsend is the engineer.

THE RAILROAD FROM BRUSSELS TO MALINES cost 1,224,100 francs, and produces immense profit to the Belgian Government, which established it. The receipts from the 17th of May to the 1st of July last, were 106,802 francs, paid by 163,482 passengers. The distance is 4 leagues, and the journey is made in 35 minutes.—[Paris Advertiser.]

#### STEAM CARRIAGES ON COMMON ROADS.—

Mr. WALTER HANCOCK performed a journey of 75 miles, from London to Marlborough, in his steam carriage, the *Erin*,—originally called and described in this journal as the "*Era*." The time occupied was about twelve hours, seven and a half of which was running time, as will be seen by the following account:—

JOURNEY FROM LONDON TO MARLBOROUGH IN MR. WALTER HANCOCK'S STEAM CARRIAGE, THE "*ERIN*."—Sir: The "*Erin*" steam carriage, which was built by Mr. W. Hancock to run on the Paddington road, and originally called the "*Era*," (described in your journal, No. 585) started from Stratford on Tuesday morning last, at half-past four, for Marlborough, with a party of gentlemen. Mr. Hancock had attached a small tender to the carriage, containing coal and water sufficient to have lasted us to Reading; but the bar of wood, through which the bolts ran that fixed the tender to the carriage, gave way in Cheapside, and we were obliged to leave the tender behind us.

The carriage reached Hyde Park corner by six o'clock, where we remained about

half an hour to take in some of our party, and proceeded on to Reading, which we reached at 11 minutes past 11 o'clock. The company stopped there an hour and a half and dined; after which the journey was resumed.

The carriage reached Marlborough by half-past 6 o'clock, with no other accident than the breaking of one of the bands of the blower. The total time on the road was a minute or two short of 12 hours, of which 4½ were occupied in stoppages, leaving 7½ hours for travelling the 75, being at the rate of just 10 miles an hour.

No one who has not travelled by steam carriages can imagine the inconvenience and delay which results from the want of regular and ample supplies of water; the carriage having to stop from 14 to 18 minutes every 10 or 12 miles to fill the tanks by hand-buckets from pumps, with sometimes the additional inconvenience of having to take the supply from some neighboring stream or pond. While the carriage is stationary, the fire slackens in consequence of the blower being stopped, and it requires about two miles running to get it again into full play. By observations which I made on the road while timing the carriage, I found that the rate of the first three miles, after taking in water, averaged 7½ minutes a mile, whilst the latter part of the distance, till the carriage again stopped for water, averaged one mile in five minutes. Frequently the men were obliged to use any kind of water they could get; some being filled with duck-weed, straw, and filth of every description, which, of course, very much retarded the generation of steam. The inconveniences arose in the present case chiefly from the loss of our tender, which would have carried us to Reading without any stoppage.

All these delays would, of course, not happen, if water stations, having tanks with large hose, which might fill the carriage in a minute, were provided. There is no doubt, that had such arrangements been made for supplying the "*Erin*" on the present journey, it would have performed it, including stoppages, in 6 hours; though the carriage was not built, I am informed, nor intended for long journeys, but for such short distances as between London and Paddington.

Mr. Hancock started from Marlborough to return to London on Friday at half-past five. The carriage accomplished the ascent of Marlborough hill—the steepest acclivity on the Bristol road, being full one mile long, and having a rise of about 1 in 7, in 6 minutes, with a stoppage of 4 minutes. The "*Erin*" reached Reading by 10, and stayed 1½ hour for breakfast. After running through the town we continued our journey, and reached London by half-past five, being again 12 hours on the road, and having lost nearly about the same time in stoppages as on our journey down.

Our reception on the road was very cordial; there was scarcely any manifestation of bad feeling throughout the journey; indeed, wherever we stopped to take in water, we had every assistance given us by the bystanders. We were particularly well received at Marlborough, where we stayed two days. The carriage made a trip through the town each day; and Mr. Hancock astonished the inhabitants by the easy manner in which he could turn, stop, or back his carriage. Two gentlemen of Marlborough most hospitably entertained the steam travellers whilst they remained in that town.

Subjoined, I give a table of the performances of the steam carriage taken from

the notes of the gentlemen who timed the carriage.

And remain, yours truly,  
London, August 10, 1835.

R.

Messrs. MAUDSLEY AND FIELD performed the same distance in five hours 49½ minutes, running time.

JOURNEY FROM LONDON TO MARLBOROUGH BY MESSRS. MAUDSLEY AND FIELD'S STEAM CARRIAGE.—The journey from London to Marlborough has been also recently performed by the steam carriage constructed by Messrs. Maudsley and Field for Sir Charles Dance, Mr. Macneil, and other gentlemen. We extract the following statement of its performances from a letter of Mr. Macneil to the newspapers. It will be seen that the rate of speed realized was nearly the same as in the case of Mr. Hancock's "*Erin*;" but the time occupied in stoppages was less, owing, no doubt, to better arrangements having been made for the supply of water:—

"Time on the road in going down	8 10 30
Deduct stoppages	2 21 4
Total time while moving	5 49 26

Which gives about 12·86 miles per hour whilst running.

Time returning	11 22 0
Deduct stoppages	4 2 0

Total time moving	7 20 0
-------------------	--------

Which is rather more than 10 miles per hour whilst running."

[From the London Mechanics' Magazine.]

MR. GALT'S SUBSTITUTE FOR STEAM POWER.—The following is an extract of a letter addressed by Mr. Galt, the celebrated novelist, to the Greenock Advertiser:—

"The fatal explosion of the Earl Grey steamer has induced me to try if the principle of my pressure-syphon could be applied to propel vessels; and the result has been so perfectly satisfactory, that I find myself actuated by humanity to make it public, that others may test the experiment, the simplicity of which is not the least of its merits.

"Take a cylinder, and subjoin to the bottom of it, in communication, a pipe—fill the pipe and the cylinder with water—in the cylinder place a piston, as in that of the steam engine—and then with a Bramah's press, and a simple, obvious contrivance, which the process will suggest, force the water up the pipe, the pressure of which will raise the piston. This is the demonstration of the first motion.

"Second—when the piston is raised, open a cock to discharge the water and the piston will descend. This is the demonstration of the second motion, and is as complete as the motion of the piston in the cylinder of the steam engine; and a power as effectual as steam is obtained without risk of explosion, without the cost of fuel, capable of being applied to any purpose in which steam is used, and to an immeasurable extent.

"The preservation of the water may in some cases be useful, and this may be done by a simple contrivance, viz. by making the cock discharge into a conductor, by which the water may be conveyed back at every stroke of the piston to the pipe, at the end of which the Bramah's press acts.

"My condition does not allow me to do more than to solicit that the experiment may be tested. Although no mechanic, I yet believe myself mechanician enough to see the application of the principle."

**GREAT RAILROAD MEETING IN BOSTON.**—On Wednesday evening a large public meeting was held at *Faneuil Hall*, to concert measures for the completion of the great Western Railroad to Albany.

The meeting was very large. Mr. Abbott Lawrence was in the chair, and T. B. Curtiss, and S. B. Higginson were the Secretaries.

Delegates from Albany were in attendance.

A Committee appointed at a previous meeting made a long report, from which we annex an extract, explanatory of the objects in view.

The Railroad proposed to be constructed under this charter extends from the Boston and Worcester Railroad to the border of the State of New York. To complete the line from that point to the Hudson river, two railroads have been incorporated by the Legislature of New York, one leading from the life of the State to the city of Hudson, and the other leading from the same point to Greenbush, on the bank of the Hudson river, opposite to the city of Albany. The stock in both these corporations have been taken up by citizens of the State of New York, and the routes have been surveyed. On one of them the work is now in actual progress, and on the other it will soon be commenced. In addition to these two Railroads, which may be considered as branches of the Massachusetts Western Railroad, a third is proposed, leading from the same point at West Stockbridge to the city of Troy. Public notice has been given, that application will be made to the Legislature of New York, at its next session, for the incorporation of a company for this purpose, with a capital of \$600,000.

The line of communication, therefore, proposed to be established, and which will be completed by the construction of the Western Railroad, will lead from Boston, through the whole length of this State, passing through its centre, and through the centre of three western counties to the Hudson river, where it will unite, at two or three points, near the great channels of communication already established, leading to the St. Lawrence on the North, to the great Lakes in the West, and to the city of New York in the South.

The report concluded with the following resolutions, which were unanimously adopted.

Resolved, That in the opinion of this Meeting, a Railroad, leading from this city through the centre of the Commonwealth to the Hudson River, will be of great public utility, by affording an easy and rapid communication, and thereby establishing a more intimate personal and commercial intercourse, between Boston and the Western parts of the State, and also between Massachusetts and New-York and the Western States.

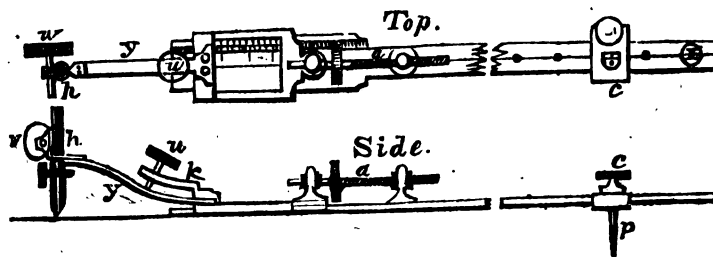

Resolved, That in the opinion of this Meeting, the prosperity of this City will be particularly promoted by the great public improvement now proposed, by the increase of its trade and population, and a proportionate advance in the value of property therein.

Resolved, That in the opinion of this Meeting, the work now proposed will not only be beneficial to the public, but productive of a profit to the proprietors, affording an adequate remuneration for the heavy capital which will be necessarily invested in it.

Resolved, That such is the magnitude of this undertaking, that it is necessary for its accomplishment, to rely on the aid of an enlightened public spirit; and that consequently, however strong may be the assurance that the profits resulting from it will afford an adequate return for the capital invested therein; those citizens who shall subscribe for the Stock, with the laudable purpose of raising a sufficient fund for the prosecution of the work, and of thereby promoting the important benefits which will result from it, will be entitled to the thanks of the community, as public benefactors.

Resolved, That Committees be appointed of six persons for the City at large, three for each ward, for South-Boston, and for the towns of Charlestown, Lynn, Cambridge and Roxbury, to solicit, in concurrence with the persons named in the Act establishing the Western Railroad Corporation, subscriptions to the Capital Stock of the same, and to return the subscriptions so obtained, to the persons entrusted by the said Act with the charge of the same.

TRAUTWINE'S BEAM COMPASS.

[From the Journal of the Franklin Institute.]

*Description of a Beam Compass, contrived by JOHN C. TRAUTWINE, of Philadelphia, Architect and Engineer.*

TO THE COMMITTEE ON PUBLICATIONS.

Having recently had occasion to draw several maps of railroad surveys, on a large scale, I was at a loss for a beam compass, of a length sufficient for striking the curves, and, in consequence, contrived, for that purpose, the one here described.

Finding it to answer in a very satisfactory manner, and thinking it might, in the absence of a better, be useful to others, I submit it for insertion in the Journal, provided it be considered of sufficient utility.

The instrument consists of a strip of brass, (mine is three and a half feet long, half inch wide, by one-twelfth inch thick,) having its edges rounded, to prevent its catching in any inequalities in the paper, and being divided and numbered into feet and inches, or in any manner that may be preferred.

Precisely in the centre line of the strip, and at each point of division, is carefully drilled a very small circular hole, entirely through the brass, and barely large enough to admit the finest sewing needle. Pains must be taken to drill these holes *precisely vertical*.

At that end of the beam where the numbering of the divisions commences, is a sliding vernier, by which the divisions may be subdivided into hundredths of an inch. This slide is moved along the end of the beam, by means of the screw, *a*, and is furnished with a holder, *h*, into which a pencil, or drawing pen, may be inserted. It has also a screw, *u*, which, by operating on the stiff piece of brass, *k*, above, and the elastic piece, *y*, below, forces the pencil, with any required degree of pressure, against the drawing. The lower piece, *y*, is elastic, that it may, by yielding, allow the pencil to play over any roughness, or knots, that the paper may contain; and is very essential to the drawing of a clear, unbroken line. *c* is a sliding piece of brass, with a point, *p*, and a semicircular hole, *o*, on top, (for seeing the dimensions on the beam.) It will often be found useful for ascertaining the centre of a circle by trial, when it is inconvenient to do so by calculation.

As the size and proportion of the parts of the slide, (particularly of the spring and pen,) are of great importance, and mine are the result of several trials, I

have represented them at one-quarter the full size, to enable others to make them with certainty at the first attempt.

The drawing ink should be perfectly clean and free from dust, and of a certain degree of fluidity, which a few trials will point out.

The paper should be brushed with a clean handkerchief, to remove dust, before beginning to draw the curves.

The dimensions above stated I consider sufficient for beams six feet long, which gives a diameter of twelve feet, a size which is very rarely exceeded in neat finished drawings on paper.

For radii less than three feet in length, both the breadth and thickness of the strip may be reduced.

To use the instrument, having first found the centre from which the curve is to be described, drive a fine needle firmly and vertically into it; and over the needle, place that division hole of the beam which more nearly corresponds with the required radius; after which, bring the pencil *precisely* to the point of beginning of the curve, by means of the screw, *a*; and after giving it a proper degree of pressure on the paper, by turning the screw, *u*, describe the curve by merely pushing the beam over the paper, without any other vertical pressure than what arises from its own weight. When one line is drawn, and the pencil is to be taken back, to commence [another, it may be raised from the paper, either by unscrewing *u* a little, or by slightly lifting the whole slide. It will not be necessary to lift the beam off the needle, for the purpose of altering the position of the pencil, for drawing concentric curves, whose difference of radii does not exceed the play of the slide, as that may be done much more readily by the screw, *a*.

In this manner, any number of curves may be described from one point, without the least enlargement of the centre hole in the paper; a defect to which all other beam compasses I have ever seen, are liable. This is subject to so little spring, or irregularities of any kind, that I have, in the width of *one inch*, described *one hundred* concentric curves, of *seven feet* diameter, precisely equidistant, with as much neatness, accuracy, and clearness, as I could have drawn the same number of small ones, with a pair of common six inch dividers.

The instrument is peculiarly adapted to cases where the centre is on the same plane as the drawing, and where the beam

will be supported throughout its entire length, or where it may be upheld by intermediate supports, sufficiently near each other to prevent any degree of sagging; but where it is impossible to support it between the centre and the pencil, it is not by any means to be recommended.

When the curves are finished, the needle may be easily withdrawn, either between the legs of a pair of common dividers, or between the blade and back of a penknife. A hole,  $x$ , should be made in the beam, for hanging it up.

These beams are kept ready made, for sale, by Mr. William J. Young, mathematical instrument maker, of this city.

**CROTON RIVER.**—We perceive by a statement in the Daily Advertiser, that the Water Commissioners have requested Mr. Douglass, Chief Engineer of the New-York Water Works, to make a gauge of Croton River in its present state, which has been done accordingly. The result is communicated to the Chairman of the Commissioners, Hon. Stephen Allen, in the following terms:

SING SING, 6th October, 1835.

Dear Sir:—It being a rainy day, I have completed my calculations relative to the supply of water in the Croton, and lose no time in sending you the result.

The gauging was performed yesterday (Monday) morning, before the flow had been increased by the working of the Mills above, and probably exhibited the very lowest rate of discharge which has been experienced this season, in consequence of the water having been generally shut back in the ponds during Sunday.

I confess I was somewhat alarmed by the appearance of the stream—it was drawn into so narrow a channel, leaving wide margins of its slimy bed, which had rarely, if ever, been uncovered before, and which had evidently been under water the day previous, now uncovered—and the stake which I had driven at the former gauging, standing high and dry at a considerable distance from the water's edge. I proceeded with my work, however, and gauged the water, even in this reduced state, with extreme care, and found the result as follows:—

Section of water equal 40 1-2 square feet.

Mean velocity per second 97-100ths of a foot.

Giving for the discharge per second 39 28-100ths cubic feet.

And per day 3,393,792 cubic feet.

Which is equal to 21,133,324 standard gallons.

The gauging was performed near Pine's Bridge, and of course did not include Flewelling's Mill Streams, and several other runs which were found unfailing, and which discharge their waters above the dam. The first mentioned, being the most considerable, were gauged, (two of them,) and found to yield jointly 744,386 gallons, which being added to the preceding result, gives an aggregate of 21,877,650 gallons\*—the smaller runs referred to not being included.

I thought it desirable to obtain this result, as being the minimum flow under the most unfavorable circumstances; it evidently ought not, however, to be considered as the discharge of any one entire day. The waters had been stopped back on the Saturday night previous, and the stream at the instant of gauging, appeared to be under the full effective influence of this stoppage—probably a few hours would again restore it to its customary height. To verify this fact, one of the party was left behind for the purpose of taking the height of water, by a certain mark, frequently during the next following 24 hours, and the following were the results: at 5 P. M. of the same day, the water had risen 1 7-8 inches, at 9 in the evening no further change either way; during the night a storm commenced and continued raining in the morning, so that the rise of water was considerably influenced thereby.—The measurement at 7 A. M. on this morning, for instance, gave a rise of 4 3-8 inches, and at 10 a

\* This quantity estimated in Ale gallons is 21,210,433.

And in common wine gallons, 26,266,904.

rise of 7 7-8 inches above the level at the hour of gauging—and there now is, therefore, probably more than a hundred millions of gallons running, from the joint effect of rain and diurnal increase.—To avoid any error in estimating the effect of rain, I exclude the observations of this morning, and deduce my average daily supply from the result of the gauge, and the notes of last evening. These carefully calculated gave 27,954,790 standard gallons; and this, under all circumstances, I consider as the lowest daily supply for this year—certainly very much within bounds, as I have no doubt from my observation of the stream, that the flow would have been much increased this morning, independently of the rain, and would have given us, could I have ascertained it by an actual measurement, an average considerably higher than that stated.

Having thus deduced what may be considered as the minimum rate of flow at any one time, and the minimum daily supply, I will just add in connexion, a remark upon the general average of supply, during the drought, for this is the real question of interest in relation to the supply of the city.

On the seventeenth of August I gauged as heretofore reported, and found between 43 and 44 millions of (wine) gallons flowing. I have since repeated the calculation of my notes with greater care, and find the quantity in standard gallons equal to 39,601,266—from that time to the date of the recent gauging, the river has been falling regularly,—but as it fell towards the last more slowly than at first, and that we may run no risk of over estimating, I give twice the value in averaging, to the low result, that I do to the high one, and upon this principle I find the daily discharge for the time mentioned (49 days) equal to 31,836,948 standard gallons.

One other remark—Our Croton reservoir will be 400 acres in extent, and will contain therefore, about 100,000,000 of gallons to each foot of depth at the surface. The disposition of the works at the head gate, will be such as to admit of drawing this down if necessary, say 3 1-2 feet (350,000,000) with a residue of held still sufficient for the full supply of the conduit—we shall thus have a disposable surplus, for occasions of drought, sufficient, after deducting an ample allowance for evaporation, to afford 5,600,000 gallons per diem for fifty years, and this being added to the preceding average for that time, gives an available aggregate of 37,436,948 gallons per diem.

All these calculations, it will be recollected, are founded upon actual ascertained results, during a season of unparalleled drought—on this point there is no difference of opinion. The counties of Westchester and Putnam, furnish incontestible proof of it, in the multitude of streams and springs every where noticed as having failed this year, which have never been known to fail before; and the Croton itself, according to the concurrent testimony of the inhabitants, has been at the same time lower and lower for a longer period than is remembered on any former occasion. A result, therefore, obtained under these circumstances may be deemed certain, and should, I think, put the question of supply entirely at rest.

I should not omit to mention that I gauged the water on the same day at the wire factory below Garritson's Mill, and found it to agree very nearly with the gauging above, the pond having been drawn down (evening) and the head gates drawn clear of the water,—the difference was only about about 200,000 gallons. This gauge, however, was less likely to be accurate than that at Pine's bridge, as there was a considerable stream wasting through the dam, which it was difficult to measure accurately, on account of its spreading among the stones. I shall continue to keep an eye upon this subject, should anything further occur worthy of notice.

I remain, yours very truly,

D. B. DOUGLASS.

Chief Engineer N. Y. Water Works.

Stephen Allen, Esq. Chairman, &c.

[From the Albany Argus, extra.]

#### ALBANY.

The following communication, exhibiting the actual condition of our city, its prospects and advantages, is from a source, it will be perceived, that entitles its statements to entire credit. We lay it before our readers with the more pleasure, as the present indications point not only to the continued prosperity of the city, but to the prevalence of a

spirit among us that must lead to a far higher appreciation of the advantages of this most favored location for all the purposes of extensive business and profitable adventure. The growth of Albany has been steady, and in all respects substantial. At the head of one of the most noble rivers in America—at the confluence of the river, and a chain of internal communication, stretching west from the Hudson to the Mississippi, and north to the St. Lawrence—the recipient of the products, not only of our own west, with its abundance and fertility, but of all the extended and rapidly improving country, bordering upon and lying between the two great points referred to,—its destiny cannot be mistaken. It must become one of the largest of the cities of the Union. This result will be facilitated by the measures now in progress for opening a direct communication, via Stockbridge and Worcester, to Boston; and particularly by the fresh spirit and energy with which our citizens have entered into that and other improvements.

This communication, which we conceive to be of sufficient value to issue in this form, is intended to be addressed to such persons in the New-England States especially, as will be likely, from their character, standing and relative situation, to view the matter with interest, and give it circulation among those for whose information it is designed.

SIR—With a view of inducing men of capital and industrious mechanics contemplating to remove from your neighbourhood to this or the western states, to establish themselves in this city, we take the liberty of presenting to you the following statement, with the request that you will give it a general circulation.

ALBANY, the capital of the State of New-York, is near the head of navigation on the Hudson River, where the great western and northern canals terminate. Its happy position, at a point where a river navigable to the ocean, and one of the finest in the world, meets the great inland communications with the northern and western lakes, ensures its advancement, and that at no distant period, to the very first rank among the inland cities of this country. Since the completion of the Erie and Champlain canals, its progress in population and business has been almost unexampled.

In 1820, the number of inhabitants was 12,630. In 1830, 24,209, being an increase of 92 per cent in ten years. No census has been taken since 1830, but one is now in progress, and will shortly be completed. No doubt is entertained, from the increase of business in the city, that it will show a very great increase of population over that of 1830.

The following table shows the increase in the amount of produce and merchandise arriving at Albany, by way of the Canal in two years from 1832 to 1834:

COMPARATIVE TABLE FOR THE YEARS			
		1832.	1834.
Domestic spirits,	bls.	21,285	20,839
"	hhd.	1,374	
Boards and scantling,	feet,	36,090,594	62,103,000
Shingles,	M.		22,643
Timber,	feet,	55,569	104,145
Flour,	bls.	482,695	795,192
Provisions	"	21,274	20,864
Salt,	bush.	23,117	19,070
Ashes,	bls.	19,091	16,494
Wood,	cords,	15,224	17,685
Wheat,	bush,	145,960	233,574
Coarse grain,	"	908,943	490,680
No. of boats arr'd and cleared,		14,300	18,554
No. of tons,		109,300	146,800

It appears from the above table that the increase in favor of 1834 over 1832 on the three greatest articles of merchandise, viz: lumber in its various shapes, flour and grain, is from 70 to 100 per cent. and a continued increase will no doubt go on.—The lumber trade alone at this city, is already immense, it being one of the best lumber markets in the union, and promises to continue so for a long time to come.

The following is a complete return of the different articles arriving at Albany by way of the canal during the year 1834.

1834.	
[Complete return of articles, under the new order.]	
Domestic spirits, bls.	20,839
Boards and scantling, feet	62,103,000
Shingles, M.	22,643
Timber, feet	104,145*
Staves,	56,438,000
Flour bls.	795,192

Provisions, "	20,864
Salt, "	10,070
Ashes, "	16,944
Lime, "	455,810
Beer, "	293
Cider, "	43
Dried fruit, lbs.	45,934

Clover and grass seed, lbs.	790,454
Flax seed, "	613,046
Wool, "	591,760
Cotton, "	22,412
Cheese, "	1,553,304
Butter and lard, "	1,826,341
Hops, "	247,165

(CIRCULAR.)

Hemp, "	57,581
Tobacco, "	447,349
Fur and peltry, "	361,383
Stone, "	4,111,323
Merchandise, "	181,218
Furniture, "	199,747
Clay, "	4,256
Pig lead, "	1,000
Pig iron, "	49,213
Iron ware, "	377,922
Sundries, "	8,129,695

There is no doubt that the business of this year will very greatly exceed that of the last. By returns from the collector's office at Albany, up to the 1st of August, (after which it will be recollected the great business season of the year is yet to come,) it appeared that the amount of many of the articles mentioned in the foregoing report which had then arrived, exceeded the entire quantity that arrived during the whole of last year.

The following is a statement of the canal tolls received by the collector at Albany, down to the 1st of September in 1834 and 1835:

To the 1st of September, 1834,	\$124,262 49
" " " 1835,	192,883 10

Being an increase of business by the way of the canal of 56 per cent. since last year. Besides this, a considerable quantity of produce is brought to Albany on the Mohawk and Hudson Railroad, which strikes the Erie canal at Schenectady—the amount being about 420 tons per week.

For the future, the prospects of Albany are still more encouraging. The Railroad from Schenectady to Utica is now constructing, and will be completed by next July or August; thus extending the railroad communication 100 miles west. Railroads are also constructing between Syracuse and Auburn and between Rochester and Batavia, which will so far complete the line of railroads to Buffalo, that it is easy to foresee that but a short time can elapse before a continuous line will be established to Lake Erie, thus making the spring and winter facilities of transportation nearly equal to those of the summer. A company is now engaged in making surveys for a railroad from Albany to Stockbridge in Massachusetts, which with the contemplated railroad from Stockbridge to connect with the Boston and Worcester railroad, will form a chain of railroad communication between Albany and Boston, which will be of great advantage to this city, especially in the winter; when the intercourse by water with New York is suspended. When all these roads are completed, and there is no doubt they soon will be, and the links west of Utica, above referred to, filled up, there will be a line of railroad communication from Boston to Buffalo; from the Atlantic to the western lakes, of which Albany will be the business centre.

While private enterprise is doing so much to improve the communication with the west, the State government by a late law has authorised an enlargement of the Erie Canal and the construction of double locks, which it is supposed will have the effect to reduce the price of transportation 30 to 40 per cent., and greatly to augment it in quantity.

The present rate of toll on 1000 pounds of flour from Buffalo to Albany is \$1 62 1-2. The reduction will bring it to less than one half the cost, for the same distance by any other route, and the valley of the Mohawk must continue to be, as it always has been, the natural and easiest channel of commerce with the west, and Albany the depot

where the exchange takes place between the productions of the interior for those of the sea coast and of foreign countries. This exchange will be much facilitated by the improvement now making in the navigation of the Hudson, by the United States government. The removal of the bar, which is the object of this improvement, will, when completed, deepen the channel to about twelve feet, and will give to this place a West India trade, in which the productions of the islands, consumed in the west, will be exchanged for the produce brought down the canal, without being burdened by landing, storage and reshipment at New-York.

No doubt is entertained that the coasting and West India trade will be carried on to a very great extent in Albany, and with very great profit and success, so soon as the improvement in the river navigation is completed; and for the reason above given, no place in the country can, in many respects, be more advantageously situated for it. Indeed, the coasting trade carried on between this city and the seaport towns of New-England, is already very extensive. There are about twenty-five regular trading vessels between Albany and Boston only, which it is estimated by one of our most intelligent forwarding merchants bring to this place about \$5,000 quintals codfish during the season, and about 25,000 barrels of mackerel, besides large quantities of merchandise which passes up the canal or stops for a market here, not less, probably, than 5000 tons. These vessels take from Albany to Boston, in return, about 75,000 barrels of flour per season, together with large quantities of timothy seed, peas, wool, &c. The indirect trade between Boston and Albany, which is transhipped at New-York, is also very extensive.

Besides the routes above mentioned, others are making to the north, all directly communicating with this city, and increasing its advantages. A railroad communication already exists between this place and Saratoga Springs, by way of the Mohawk and Hudson and Saratoga and Schenectady railroads. The railroad now about making from Saratoga Springs to Whitehall, will complete the route to Lake Champlain, and afford the same advantages for a trade with Canada in the fall and spring as are now given by means of the northern canal in the summer.

It necessarily results from the situation of Albany, and its easy means of communication with the surrounding country, that an immense travel centres at this city. Some idea may be formed of its extent when we state that it is estimated, and no doubt truly, that from 600,000 to 800,000 persons arrive at and depart from this city in the course of the year, by the several stage routes, railroads, steamboats and other vessels—and this number is yearly increasing, and no doubt six years will see it doubled.

In consequence of this city being a great depot for the produce of the north and west, raw materials for manufacture are obtained here at the cheapest rates and provisions are lower than in any of the Atlantic cities. The market is abundant at all seasons of the year, and is well supplied with all the necessities and luxuries of life, at moderate prices.

Industrious mechanics, and all men of enterprise and character, cannot fail to prosper in Albany, as the means of living are cheap, and the market extensive—communicating with almost every section of the country, in the readiest manner. All will here find an almost certain reward for their exertions; almost every branch of mechanical labor is or may be carried on at this city to very great advantage, and no doubt with great success. Good water power exists in its vicinity for mills and manufactories, and a ready market can easily be found for all products of labor and skill. With the strong conviction that the interest of those who may come to take up their residence in our city will be promoted, as well as the prosperity of the city thereby increased, we hope that you will give circulation to this statement, among such as you may suppose wish to seek in this State additional encouragement for their enterprise and industry.—Respectfully, yours,

LEWIS BENEDICT,

An Address to the Mechanics of Easton, Pennsylvania, delivered at their request, by JAMES MADISON PORTER, on the 4th of July, 1835.

(Concluded from Number 39.)

Oliver Evans was originally an apprentice to a wagon maker or wheelwright. But he was a boy who thought and read, and his attention was called to the expansive power of steam by the heating of a gun barrel in a blacksmith's fire, in which about a gill of water had been confined. He read and reflected, until he made as great an improvement in the use of steam, as perhaps any who preceded him.

As steam has been referred to, let us for a moment advert to the mighty engine it has become in the hands of men. Its expansive power was known to the ancients: "The elegant toys of Hiero—the beautiful experiments of Porta and DeCaus—the modification of the Greek machine by the Italian Branca—the ingenious ideas of Hautefeuille, and their masterly extension and development by Papin, contain all the rudiments required for a perfect machine, wanting only to be touched by the magic hand of some mechanical magician, to form a structure of surpassing ingenuity and semi-omnipotent power."

The total neglect with which these individual schemes were regarded, is not the least extraordinary circumstance in the history of the steam engine. And when the Marquis of Worcester, towards the close of the seventeenth century, made his first attempt, imperfect as it was—yet successful, in applying steam as a moving power, he was unable to interest the public in the matter, and it fell almost, if not entirely, into oblivion, until Captain Savery, thirty years afterwards, succeeded in combining a mechanism in which steam or elastic vapor was the motive power. Newcomen carried it somewhat farther. The improvement thence progressed, until the invention of Bolton and Watts, perfected, as was supposed, the system of condensation, so as to give the greatest possible power to a given quantity of steam generated. Our own Fulton adapted it in practice, the first successfully, to the propelling of boats, and, in the short period he lived thereafter, not less than fifteen steamboats were built and put in use, under his own direction. Suffice it to say, that it is now used as the motive power for almost every purpose. Steam has added to the productive faculties of Britain what would be equal to some hundreds of millions of operatives; and what has it not done for our own country, where the price of labor is higher than in foreign countries?

Steam and water, by the aid of improved machinery, are accomplishing wonders, and indeed it would seem that we knew not where the perfection of machinery will end. This much we do know, that we must keep pace with the improvements of the times. Who now would think of making cut nails with the hand-machine in use less than thirty years since? On a recent examination before the House of Commons in England, it

was testified, "A cotton manufacturer who left Manchester seven years since, would be driven out of the market by the men who are now living in it, provided his knowledge had not kept pace with those who have been, during that time, constantly profiting by the progressive improvements that have taken place in that period."

There is a very common error existing among those who have never reflected on the subject, that these improvements in the Mechanic Arts which have so increased and economized the products of labor, are prejudicial to individuals, by depriving them of work. All experience has shown that it is not the result. The reduction of price always increases the quantity sold in a corresponding degree, and thus the amount of labor which must be done by hand, is kept up, so as to give equal, if not increased employment to operatives. To give a familiar illustration:—Some years since all the floor boards used in our cities, were planed, tongued and grooved by hand; now they are principally, if not altogether, done by machinery. Sash, too, in all our large cities, until lately, were made entirely by hand; now they are made in many places by machinery. In both these items, the prices of the article have been reduced fifty to seventy-five per cent. Many carpenters were apprehensive that these things would ruin their business, and throw them out of employment. Has such been the result? On the contrary, has there not been an increased demand for carpenters in those very cities, from the fact that the diminished expense of building in consequence of these and other improvements by labor-saving machinery, has induced so many more persons to invest money in buildings? and has not the price of labor among carpenters been so enhanced, that many have gone from the country to the cities, induced by this advance in wages?

Now, believe me, such will ever be the case in every branch in mechanism and manufactures.

The invention of the spinning wheel undoubtedly threw hand spinners out of employment at hand spinning, but gave them increased employment at other branches, in consequence of the increased demand, from their reduced price, for the articles spun.

So, too, with power looms—so, too, with the carding machine—the cotton gin—the last of which actually doubled the value of the cotton lands to the planter; and who now never sees a pair of hand cards used, unless it be for some very special purpose.

All these things had the effect of changing the direction of labor, and yet no one will doubt but that they have all tended to advance the interests of the community at large; and it may be laid down as an axiom in political economy, that, whatever benefits the community at large, must eventually benefit all the members of that community.

The great object which I have had, in throwing together these desultory observations, has been to call your attention to

the propriety, nay, necessity, of improving yourselves in your various callings and trades, by learning, in addition to the practice, the principles on which your work is done—in other words, to ask you to think, to reflect, to read and learn what others have done before you, and to add your own experience to the existing stock of knowledge.

The mechanics of our country, and I flatter not when I make the assertion, are as useful and valuable a class of citizens as our country contains. In general, they may be said to fill that happy medium position in society, in which neither overgrown wealth nor abject poverty is found. To this there may be, and are some exceptions, but not enough to operate against the truth of this, as a general assertion. The question you are asked to answer fairly, and truly, is, Have you availed yourselves of all the means placed within your reach, to increase your own resources, or to sustain in society, and in the government of the country, that station to which your numbers and moral standing entitle you? If you have not, to what is it attributable? Your good sense and your patriotism are sufficiently known. It was to the mechanics of our country—of Boston—that we are perhaps indebted for the final adoption of the present Constitution of the United States. They met at the Green Dragon in Boston, in January, 1788, and recommended to the Convention of Massachusetts the adoption of the Constitution. It was Paul Revere, a brass founder of Boston, who carried these resolutions to Samuel Adams, who presented them to the Convention; and they tended much to induce that body of men to decide in favor of the adoption of the Constitution. For the interesting circumstances which took place on that occasion, I beg leave to refer to a speech delivered by the great champion of our Constitution, Daniel Webster, at Pittsburg, two years ago this day.

On you, my friends, the preservation of that glorious Constitution, and the liberty we enjoy under it, may very much depend. What boots it that our fathers fought and toiled, and many of them fattened their native soil with their blood, if their descendants should not properly prize the blessings handed down by them? And how can we prize those blessings properly, if we will not use every means for increasing knowledge—intellectual light—among us? And why are you, mechanics, especially required to carry on this glorious work?—because, in doing so, you will be peculiarly advancing your own secular interests, whilst you will be better fitting yourselves to play your own parts, as constituent members of that government, a portion of whose sovereignty you are.

You have advantages, which, in early life, neither Rittenhouse, nor Oliver Evans, nor Fulton enjoyed. You have all the lights they have shed; and all the improvements by those who preceded and those who succeeded them, both in Europe and our own beloved land, are placed around and before you, and within

your reach and power, to use and to improve, if you will.

It is astonishing the amount of information which one hour alone, out of the twenty-four, bestowed on the acquisition of useful knowledge, will bring forth. It is almost incredible, the amount of scientific works which a trifling contribution from each member of an association may bring together. There is no axiom truer than that "Time is Money"—nor than, that the heaviest taxes we pay, (as Dr. Franklin averred,) are those imposed upon us by our idleness, our pride, and our folly. The daily expense, which almost every one incurs, of a sixpence, for some matter of amusement or refreshment, which might just as well be dispensed with, would, if contributed by five hundred mechanics, and our town surely contains more than that number, produce over ten thousand dollars per annum. Yet such a tax imposed by government would be esteemed outrageously oppressive. One hour out of the twenty-four, now perhaps spent in conversation, perhaps in a beer house, or the bar room of a tavern, per chance, discussing politics, or the merits or demerits of some candidate for popular favor, in which neither side, in all probability, consults the best rules of courtesy, or the most conciliating means of persuasion, and each leaves his adversary just where he found him, or it may be yet more firmly wedded than ever to his own opinions—this hour per day, if spent in reading some improving work, or listening to a sound and sensible lecture on an interesting and appropriate topic, might enable you, in the course of a few years, to lay in a stock of valuable information, the benefit of which no one can calculate.

Can you, then, better close the labors of this grand Jubilee of Freedom, than in associating yourselves permanently together, as a Mechanics' Institute, and by your united efforts obtain a library suited to mechanical pursuits, and make provision for hearing, during a part of the year, lectures from scientific men, on the various subjects connected with the sciences of Natural Philosophy and the Mechanic Arts?

The result will be that reflection will be induced. Your apprentices will be taught to read and think, and reading and thinking apprentices make intelligent journeymen, who in turn will make intelligent master workmen, fit to fill any station to which they may be called. An Athenæum or Reading Room is a much more fitting and improving school than some that are resorted to for spending evenings. This plan has generally been resorted to in our cities, with great approbation and unbroken success. And if the Mechanics' Celebration of Easton on the 4th of July, 1835, shall lead to a similar result here, then, indeed, may every citizen rejoice that it has been gotten up, and join in the aspiration that such an association may annually assemble on the anniversary of American Independence, and rationally celebrate the birth-day of Freedom, long as the sun holds his course, or the love of Liberty and Intelligence shall exist in the breasts of Americans.

AGRICULTURE, &c.

GREAT IMPORTATION OF IMPROVED SHORT-HORNED DURHAMS.

The *Evening Star*, of Sept. 5th, gives the following description of eight splendid animals of the above breed, imported from England by the AGRICULTURAL SOCIETY OF OHIO.

We had not the pleasure of seeing these cattle, but have heard them spoken of as a very superior lot. It is gratifying to witness the efforts in different parts of the country, to improve the breed of domestic animals—much good must result from it.

**THE SHORT-HORNED DURHAM OX.**—“Some superior specimens of this famous breed of English cattle, were imported a few days since in the ship *Great Britain*, Capt. French, from Liverpool—having been purchased for the Ohio Agricultural Society, whose enterprising exertions we have before had occasion to advert to. We believe the present are the finest samples ever brought to this country. They are eight in number, two year old and yearlings. The largest, which is a two year old white bull, is of Herculean size, but not on that account of gross or unwieldy shape, but of remarkable elegance and symmetry of proportions, both in the body, neck, head and limbs—presenting in fact a beautiful model or study for a painter like Wouermans, so famous for his cattle. He weighs 2500 lbs. and cost in England £300, making the whole expense of bringing him out about \$1000.—What seems particularly to distinguish this breed of cattle, is the small elegant limbs, the robust muscular form of the neck, the fine contour of the head and face, and the short crumpled horn turned inward. The neck in this bull is of a depth fully equal to the length of the head, the small pointed nose forming with the forehead, throat and upper part of the neck, an isosceles triangle, of which the throat is the base line.—The two year old cow, which stood in the stall next to the large bull, was of white color, and nearly of the same size, also of elegant form. The yearlings, composed of both sexes, were full as large as some of our full grown cattle. The animals were fed on the passage on hay and oil cake, (made of ground flaxseed) and the sides of the stalls being cushioned, prevented any injury from the motion of the ship, from which in fact they scarcely felt any inconvenience, as they very prudently lay down during a gale.—The consequence is they have lost but very little flesh, and are in excellent health.—The English boy who had charge of them, came out expressly for that purpose.

**RICE IN LOUISIANA.**—The annexed extract of a letter proves the productiveness of rice grown in our own state. The inducements it holds out to the planters to turn their attention to it are tempting and should not be overlooked:

“In walking through the plantation of Dr. Y. M'Daniel, which lies on the west bank of the river Ponchatoula, parish of Livingston, my attention was attracted by the enormous size of his rice. I was invited to walk in, and to my astonishment, upon an admeasurement of it, although it had not attained its full growth, it proved to be nine feet high, when cut off above the grain. Its produce was as follows: in one single stool was found 33 stalks, each stalk, on an average, produced 477 grains, which made the astonishing number of 15,741 grains, the product of one single grain of rice.”

[From the Horticultural Register.]

On Heating Horticultural and other Buildings by Hot Water.

The way properly to approach this subject, is first to consider this scheme as compared with the former methods of heating such structures with flues, warm air and steam. The objections to the first, are the dry heat it occasions, owing to the hot air circulating through the flues having been in immediate contact with the fire, by which it is deprived of its moisture, partially decomposed or altered, and largely charged with carbonic acid gas; the heat of this air is probably 4 a 600 degrees, and should the fire by accident be made too large, or a leak occur in the flues, the plants are inevitably injured. Warm air is seldom used, but is open to the same objection. We have proved in four months' successive experiments for chemical purposes, that atmospheric air passing over ignited coal, becomes combined with a considerable quantity of carbonic acid gas, which is unfit for vegetation, and injurious to respiration.

The method of heating by circulating steam through pipes, is free from this objection, but the inconveniences are, that accident or negligence may over-load the safety-valve, and endanger the building; or what is the most serious objection, that the moment the fire gets so low as to cease driving the steam, the house becomes quickly cold, no heat being given off by the pipes.

To these objections the plan of heating by hot water inclosed in pipes is not liable; the surface by which the air of the building is warmed, scarcely ever attains 160 degrees of heat, (212 is boiling point) and it is almost impossible, if the proportions are originally properly calculated, to bring it to this point; consequently the plants can never be injured by overheat, and the atmosphere remains undeprived of its moisture, unaltered and uncontaminated. I have seen two adjoining green houses heated, for sake of experiment, by flue and hot water, the same species of plants being placed in each: after two months' operation, the difference in vigor of vegetation, in size and color of leaves, was beyond all conception strikingly in favor of the hot water. The thermometer was always much more steady, and the air never felt oppressive. In addition to this, if the boiler is properly constructed, so as to have a sufficient body of water heated, should the fire be let to go out, the water will take several hours to cool, and the pipes will continue to give off heat the whole time.

In fact, the superiority of this plan has been evident ever since its first application; but it has been several times in disrepute, owing to failures and accidents arising from a want of knowledge of first principles in those who have undertaken to construct the necessary apparatus, and in every one trying to start and drive a hot water system of his own, often opposed to these principles, and as often endeavoring to force them beyond their natural limits.

There are two extremes in the application of this system, the space between which has afforded extensive ground for experiments and plans. The first is the method of Perkins, who passes strong tubes of small diameter through the midst of the furnace, and thus heats the water to 4 a 600 degrees; these small tubes continue through the buildings, and give off a large quantity of heat; they take up little room, are easily concealed, and effectually warm the building. This is, therefore, very desirable, as long as the pipes remain sound; but should any accident produce a leak ever so small, the result might be a very, dangerous ex-

plosion, notwithstanding the safety-valve.—It is idle to say that common care will prevent this; several explosions have already taken place—and although every precaution is taken at a powder magazine, yet no one prefers to reside near it.

The other extreme is not heating the water sufficiently to keep up a rapid circulation through the pipes. This often arises from a wrong construction of the pipes and boiler, as well as of the furnace. Heat cannot be economized beyond a certain degree; if every glowing coal is placed in contact with a body which abstracts its heat, it is impossible to keep up a fire, and unless sufficient heat escapes up the chimney to rarify the air there, no draft can be created, and the fire will not burn; therefore, much depends on the proper construction and proportions of the boilers and furnaces.—Again, hot water does not give off heat in proportion to its solid mass, but from its surface; therefore, the larger the surface is, compared with the solid contents of the pipes, the more rapid will be the circulation, as the heat is given off quicker, and in larger quantities; to this, however, there are limits in reason.

Attention to the proper levels is of main consequence in this system, as if any part of the pipe descends below the bottom of the boiler, the circulation is immediately arrested.

Kewley's method with a syphon inserted a few inches below the surface of the water in an open boiler, is an excellent way, where an unlimited quantity of heat is required, or where additional heat is wanted occasionally.

**THE MATHEMATICAL INSTINCT OF BEES.**—The operations of pure instinct have never been supposed by any one to result from reasoning; and certainly they do afford the most striking proofs of an intelligent cause, as well as of a unity of design, in the world. The work of bees is among the most remarkable of all facts in both these respects. The form is in every country the same—the proportions accurately alike—the size the very same, to the fraction of a line, go where you will; and the form is proved to be that which the most refined analysis has enabled mathematicians to discover as, of all others, the best adapted for the purposes of saving room, and work and materials. This discovery was only made about a century ago; nay, the instrument that enabled us to find it out—the *fluxional calculus*—was unknown half a century before that application of its powers. And yet the bee had been for thousands of years, in all countries, unerringly working according to this fixed rule, choosing the same exact angle of 120 degrees for the inclination of the sides of its little room, which every one had for ages known to be the best possible angle, but also choosing the same exact angles of 110 and 70 degrees for the inclinations of the roof, which no one had ever discovered till the 18th century, when Maclaurin solved that most curious problem of *maxima* and *minima*, the means of investigating which had not existed till the century before, when Newton invented the *calculus*, whereby such problems can now be easily worked. —[Lord Brougham's Discourse of Natural Theology,

NEW-YORK AMERICAN.

OCTOBER 10—16, 1833.

## LITERARY NOTICES.

PAULDING'S WORKS, vols. V. and VI; New York, HARPER & BROTHERS.—We have here "the letters from the South," by a northern man, which Mr. Paulding first published several years ago. The South, however, only means Virginia, which then was not so much eclipsed, as now it is—and there is not much of a Northern men in the sentiments uttered. In looking cursorily over the book, we were struck with a passage, which we subjoin, as chiming in curiously enough with some leading notions of this day. Referring to the Essays on the Constitution, by John Taylor, of Caroline, which Mr. Paulding considers as only second in value to the *Federalist*, he holds this language.

The essays on the funding and banking systems, are most especially entitled to the deep consideration of every citizen of the United States.—They exhibit, in a clear, unanswerable series of facts and arguments, the silent cunning, and almost inscrutable windings, by which these modern creators of aristocracy, under pretence of adding to the means and the wealth of a nation, operate as perpetual drains on the laboring classes, and landed interest, and finally create an aristocracy of concentrated wealth, "without rank or title; regardless of honor; of insatiable avarice, and neither conspicuous for knowledge or virtue." The legitimate aristocracy of virtue and talents, is thus superseded by that of paper-money, monopoly, and exclusive privileges; power goes over from land to money; from the many to the few; one-half the property of the nation is exempted from the burdens which the other is obliged to sustain, and the feudal baron is succeeded by the paper one. Thus, with equal rights guaranteed by the constitution and the laws; with a statute for ever abolishing the right of primogeniture, and of entailment of our own property, we see every day, nay, almost every hour of the day, the Legislatures of the different States creating corporate bodies with exclusive privileges, and granting to hundreds of societies and corporations the right of holding property in perpetuity, which is uniformly denied to individuals. Each and every one of these corporate bodies is more or less of the nature of a monopoly; and monopolies, either of wealth, honors, privilege, or power; whether of kings, nobles, churchmen, corporate bodies, presidents of societies, or bank directors, is fatal to the general diffusion of competency, wherever it exists.

NIGHTS AT MESS, 1 vol; Philadelphia, E. L. CAREY & A. HART, for sale in New York by WILEY & LONG.—These stories have appeared, we believe, separately, in one of the English periodicals, and are now gathered together in a volume, which has certainly a good share of fun.

GEORGE WASHINGTON America Septentrionalis Civitatum Federatarum Presidiss primi Vita: FRANCISCO GLASS, A. M., Ohioensi, &c.—N. Y., HARPER & BROTHERS.—A life of Washington, written in pure, flowing, easy and classical Latin, by a country schoolmaster in Ohio, whose life was passed in teaching the children of his country neighbors to read and write, is certainly a remarkable production. The circumstances under which it was composed, together with the manner in which the editor, Mr. Reynolds, became acquainted with the author, are told in a most interesting manner, in Mr. R.'s preface, from which we make no apology for extracting largely.

The following classical production came into my possession in so singular a way, that I feel bound to give the reader the whole history of it. In the summer of 1823, I was a member of the Ohio University, and left that Institution, expecting to return to college to pursue my studies, in the winter; but circumstances, unnecessary for me to state, prevented me from joining my class at that time, and I was induced to seek, in the western part of the State, a person with whom I could prosecute my studies during the winter season. I heard of a

competent teacher in Warren county, of which Lebanon is the shire, situate about thirty miles from Cincinnati. He had excited no small degree of interest among the few who were capable of appreciating his extraordinary attainments in classical literature. This man was Francis Glass, the author of the following work, "*The Life of Washington*."

I found him in a remote part of the county, in a good neighborhood of thrifty farmers, who had employed him to instruct their children, who, in general, were then acquiring the simplest rudiments of an English education. The school-house now rises fresh on my memory. It stood on the banks of a small stream, in a thick grove of native oaks, resembling more a den for Druidical rites, than a temple of learning. The building was a low log cabin, with a clapboard roof, but indifferently tight—all the light of heaven, found in this cabin, came through apertures made on each side in the logs, and these were covered with oiled paper to keep out the cold air, while they admitted the dim rays.

The seats, or benches, were of hewn timbers, resting on upright posts, placed in the ground to keep them from being overturned by the mischievous urchins who sat on them. In the centre was a large stove, between which and the back part of the building, stood a small desk, without lock or key, made of rough plank, over which a plane had never passed; and, behind this desk, sat Professor Glass when I entered his school.

There might have been forty scholars present; twenty-five of these were engaged in spelling, reading, and writing, a few in arithmetic, a small class in English grammar; and a half a dozen, like myself, had joined his school, for the benefit of his instruction in the Greek and Latin languages, preparatory to a more extended course in one of the Ohio seminaries.

The moment he learned that my intention was to pursue the study of the languages with him, his whole soul appeared to beam from his countenance. He commenced in a strain, which in another would have seemed pedantic, but which, in fact, was far from being so in him.

The following imperfect, sketch, drawn entirely from memory, may serve to give some idea of his peculiar manner:—"Welcome to the shrine of the Muses, my young friend, *Salve! Xaiye!* The temple of the Delphian God was originally a laurel hut, and the Muses deign to dwell, accordingly, even in my rustic abode. '*Nou humilem domum fastidit, umbrosamque ripam.*' Here, too, the winds hold converse, 'Eurus and Caurus, and Argestes loud,' and the goddesses of the Castalian fountain, the daughters of the golden-haired Mnemosyne, are sometimes silent with the lyre, '*citharâ tacentes,*' that they may catch the sweet murmurs of the harp of Aeolus. Here, too, I, the priest of the muses, *Musarum sacerdos*, sing, to the young of either sex, strains before unheard, '*Virginitus puerisque canto.*' Plutus, indeed, that blind old deity, is far away; and far away let him be, for well has the prince of comic poets styled him a 'filthy, crooked, miserable, wrinkled, bald and toothless creature!' *ῥεῖρα, χυφόν, ῥόλιον, ῥυτίον, μαδύρα, νυδόν.*"

Such was my first interview. It was a display perfectly natural, and without the least apparent consciousness of effort on his part. From this moment he took the greatest interest in my studies, and I enjoyed not only his instruction during school hours, but—as I had taken up my lodgings at a farm-house about half a mile from his school, on the road to his own humble residence, situate a mile beyond—almost every evening, from his deep interest in my progress, was spent with me at my dwelling.

I had been with him about three months, when he communicated to me his long-cherished intention of writing the life of Washington in Latin, for the use of schools. He, after this time, often adverted to the subject, with an earnestness I shall never forget. By parcels, I got something of his history. He was educated in Philadelphia, and spent the earlier part of his life in that city and vicinity, in literary pursuits. He often mentioned the name of Professor Ross, and said something of having assisted him in the compilation of his Latin Grammar. While acting as an instructor in the interior of Pennsylvania, he contracted an unfortunate marriage, in a state, as he said, of partial insanity; no wonder he thought so, when he found himself surrounded by evils which his imprudence had brought upon him.

Glass tried to make the best of his situation, but he could not soften the temper, or elevate the mind,

of the being to whom he was united for life. The influence of his situation, on such a sensitive scholar, was perceptible in every act. He did all he could for his wife and rapidly-increasing family, but his efforts procured for them but a scanty subsistence.

With all ambitious prostrated, and with a deadly sickness at his heart, he, somewhere in the year 1817 or '18, left Pennsylvania for the West, and settled in the Miami country. From that time to the period I became acquainted with him, he had pursued the business of school-keeping, in various places, where a teacher was wanted, subject to the whims of children and the caprices of their parents, enough alone to disturb the greatest philosopher.

The winter had now drawn nearly to a close, and the opening spring, with its busy scenes of rural life, had called nearly all the larger scholars from his school; still nothing had been definitely arranged in reference to the life of Washington. He renewed the subject again and again. I had no one with whom to consult. I did not know how to decide in my own mind, for I felt incapable of properly estimating his attainments, and what he really was capable of producing,—besides, the expenses to which I should be subjected, were matters of responsibility, gravely to be considered. My feelings, however, were interested. I pitied the man, and felt grateful for his attentions, and for the advantages I had derived from his instructions. The attempt, I knew, was a bold one; but then, the subject addressed itself to the feelings of every American heart. The example, too, of such devotion to classic literature, on the part of an individual so humble, so obscure, could not, I thought, but awaken to higher efforts, on the part of individuals more favorably situated,—nor his labors be otherwise, than received with favoring kindness by every one interested in the advancement of literature in the United States.

From the moment he learned my determination, to meet his requirements in the prosecution of his work, his gloom and low spirits forsook him, and he appeared like a new being,—though it was but too apparent, that the spirits thus newly lighted up, were still encased in a weak, fragile, and gradually sinking form.

I now visited his house for the first time. I shall not attempt a description, nor do I exaggerate, when I say, that his worldly goods and chattels, of all descriptions, could not have been sold for the sum of thirty dollars. Clothing for himself and family was now ordered, and, at the end of his term, arrangements were made for the removal of himself and family to Dayton, on the Miami, sixty miles from Cincinnati, where he immediately set about his work, and ere the close of the following winter, the whole was completed.

At this period I paid him a visit, and received from him the manuscript. His request was most earnest, that the result of his labors might be published. I promised him it should, and have never seen him since;—and, though years have rolled around, I have never, until the present moment, had leisure to attend to its publication, or to redeem the promise I had made to its author.

Poor Glass!—had he only been spared, to learn that his work had been examined and approved of by some of the ripest scholars of our country—men whose names are but other terms for all that is pure, and chaste, and elegant in classical literature—how it would have consoled and softened the last gloomy hours of his existence! For so obscurely did he live, so humbled and retired must have been his residence at the time of his death, that, since my return to the United States, I have not been able to learn a word in reference to him, except that he died while I was gone, and that his family had removed from Dayton to Germantownship, Montgomery county.

The interest of this story may justly add to that of the work it ushers forth, and when it is said that Prof. *Anthony* of Columbia College, Prof. *Patton* of the New-York University, Prof. *Wylie* of the University of Pennsylvania, and other approved scholars, bear witness to the purity of the style in which it is written, it is not an unreasonable hope to express, that this life of Washington may become an elementary class book in our Latin schools.

It was a well timed and gracious act of Columbia College, at their commencement on Tuesday, to

Confer on Mr. Reynolds, whose generous aid and sympathy cheered Mr. Glass on to the completion of his labors, the honorary degree of Master of Arts.

LA FRANCE LITERAIRE, New York.—This foreign periodical re-appears, for the first time since the Ann street fire, more disastrous to printers, though less so to letters, than that which destroyed the Alexandrian Library. The whole semi-monthly edition, for the 25th August, prepared in advance, was destroyed, together with many of the back numbers, and all the material of the printing office.

To surmount all this, in a foreign language, is not easy. In the number before us, however, we are glad to find the difficulties so handsomely overcome.

CAREY'S LIBRARY OF CHOICE LITERATURE.—Philadelphia, E. L. CAREY and A. HART. New York, G. & C. CARVILL.—A new weekly publication here greets us. Its price is five dollars per annum, for which a weekly pamphlet of 20 pp. double columns, and royal 8vo. size, is furnished, and made up of the "current literature of Great Britain, in all its various departments," and, when circumstances will authorize it, "of translations from the French, German, and Italian." In addition, the cover will contain original notices, reviews, and other articles. The numbers for one year will constitute two large 8vo. volumes! This Library makes its debut, by the re-publication of "the Memoirs of the life of Sir James McIntosh," by his son—and a better selection could not have been made. Some specimens of the Journal of Sir James were given in yesterday's paper.

THE TALES OF A PHYSICIAN; by W. H. HARRISON, 2 vols.: Philadelphia: E. L. CAREY & A. HART: For sale in New-York by WILEY & LONG. Those who, remembering the *Diary of a Physician*, with its delineations of power and pathos, may expect to find in these volumes any thing of the same thrilling interest, will be disappointed. The style of these Tales, and the incidents upon which they are founded, are, for the most part, common place enough—though they may serve to amuse a leisure hour.

THE CRAYON MISCELLANY, No. 3: containing Legends of the Conquest of Spain, 1 vol.; Philadelphia, CAREY, LEA & BLANCHARD.—Yesterday we spoke, on hearsay only, of this volume, now, we have it before us, and have eagerly perused it. It is a delightful blending of fancy and romance, on a historical basis. It is the natural pouring out of such a mind as Irving's, when warmed with the perusal of the attractive legends of the Gothic Conquerors, reposing himself the while, amidst the faded glories, and thronging recollections, of the *Alhambra*. All readers will be delighted with it.

MEMOIR OF THE REV. JOHN STANFORD, D. D., late Chaplain of the Humane and Criminal Institutions in the city of New-York, by CHARLES G. SOMMERS, Pastor of the South Baptist church in N. York: 1 vol: New-York: SWORDS, STANFORD & Co.—If the value of biography is to be measured by the services to the cause of humanity and religion, of the individual whose life is commemorated, there are few volumes that should be more sought after than this memoir of an humble, persevering and self-denying Minister of the Gospel. No one who may have chanced to be present at the services in any of the institutions to which Mr. Stanford was Chaplain, and who recalls his venerable appearance and patient labors among the hardened and the corrupt, to whom he so freely and perseveringly ministered, should forego the purchase

of a volume which presents so faithful a portraiture of his mind and career.

It is principally compiled from his own writings, prepared rather for his own guidance and edification, than from any purpose of publication; and, therefore, rendering more accurately the impressions and feelings they record.

If persuasion or proof were needed to enforce the conviction that the Gospel is indeed from on high, and that the humble laborer in its vineyard has his own exceeding great reward, the life and labors of Mr. Stanford would be eloquent on that head.—To those who, in a career less repugnant, and mid duties less irksome than those of this venerable divine, are yet sometimes ready to faint by the way side, we may, in all confidence, commend this volume of humble works, practical piety, and unfaltering faith.

A BIOGRAPHICAL NOTICE OF COMMODORE JESSE D. ELLIOTT; containing a review of the controversy between him and the late Commodore Perry, and a history of the figure-head of the United States frigate Constitution, by a Citizen of New York; Philadelphia, printed for the author.—This is a book which denotes, as much as any thing we have seen, the evil influence of party. Commodore Elliott, from taste, or accident, has distinguished himself as a partisan of General Jackson. This we hold to be exceedingly unbecoming in any officer, towards any President. Like every other citizen, an officer in the military or naval service, is entitled to his opinions and his vote; but it always seems to us a desecration of the national uniform, when any one wearing it, becomes an active and heated partisan.

The fact, however, of Commodore Elliott's being so, has undoubtedly led to the writing and publishing of this book—of which the recitals on the title page are quite sufficient to indicate the character. It is a political diatribe, in the course of which, historical truth, and illustrious names, and glorious memories are alike falsified,—and all to prove, what, if true, would have needed no proof,—that Commodore Perry had lost, and Captain Elliott redeemed the battle of Lake Erie! Start not, gentle reader, even to such lengths as this has the spirit of second hand sycophancy been carried in these pages. We will not quote from them; but to such as may be disposed to verify what is here said by reference to the book, we cite the 186th page, as one of several where this pretension is boldly put forth.

As to the history of the figure head, "the duties of the democratic party," and such like cognate subjects, we have no time to waste on them.

As a publication, we consider this book a disgrace to the country; and so indeed others seem to think, for it is without the name of either printer or publisher.

AMERICAN MONTHLY MAGAZINE FOR OCTOBER: Edited by C. F. HOFFMAN and H. W. HERBERT: New-York: GEO. DEARBORN.—This is the only periodical for the month that has yet reached us, and it is, as usual, very good—though too much space is given to the notice of, and extracts from, Mr. LaRocbe's travels. The "Letters from France," of which a series is commenced in this number, are agreeably written. We have little space for extracts, and therefore make only two short ones.

#### THE SOLDIER.

"Why go to the battle, dearest?" said the wife to her husband.

"Because we are oppressed,—and I owe my life to my country; and you, love, would not wish your husband a laggard where honor called him, because danger stood in the way?"

"No; if we could be certain that either honor

or duty called, I would be the last to detain you; though if you were killed, I could look to God alone for support or comfort in my desolation; but remember, when you speak of patriotism, that those opposed to you have the same feelings as you, and were your friends and associates. Must they be wrong?"

But he listened not to her arguments; and, taking one long kiss, laughed at her fears as he galloped to join his comrades. She was a woman and reasoned from her cowardice.

It was after a skirmish that the soldier walked the battle field, amidst the dying and the dead—and, as he drove away, the birds of prey eagerly hovering over them—and listened to the groans of agony, and curses of despair, of those whose laugh he had often heard, and whose happiness he had daily witnessed; he reflected whether any cause could justify so much misery.

He doubted whether those men would risk every thing to sustain a cause plainly wrong,—where nothing was to be gained and so much must be sacrificed; and remembering that they who had persuaded him to seek the lives of his neighbors, risked nothing by their patriotism; and, shunning the danger they persuaded others to encounter, seemed avaricious of any thing but the glory they extolled;—he saw that a few mean politicians were the country he was serving; and that he had been persuaded to avenge an imaginary wrong by a real injury. And he felt that patriotism might be a crime. Then his fond young wife, anxious and alone, mourning his absence, and constantly trembling at the perils he encountered, came over his mind; he realised her miserable uncertainty; and shuddering at her desolation if he should be slain, he wept. But the trumpet sounded; discipline drove all softer feelings from his heart, and he rushed foremost in the battle's charge—a reckless instrument of destruction.

Gallantly he dashed on, if that can be called gallant where all thought is driven from the mind, and the man sees nought but the foe before him;—his white plume could be seen tossing above the smoke, far in advance of his men;—the square he was charging fired—his horse fell, and his comrades trampled over him on their way to victory.

His body was thrown into a pit with some hundred others—his name was omitted in the despatch which told the story of the battle in which he fell. And thus ends the life of the SOLDIER! Z.

#### THE HUES OF AUTUMN.

AN INDIAN TRADITION.

But every drop this living tree contains  
Is kindred blood, and ran in Trojan veins

Here loads of fancies, in my blood imbued,  
Again shot upward, by my blood renewed.

DAYTON'S VIRGIL.

"Those bones, stranger?" said the pioneer, "why, that ignorant varmint can tell you nothing about them—they were the frame-work of men who kicked their shins against these knobs a million years before his people came here to scare game and burn the Prairies.

The Indian evidently understood the words of the rough hunter, though he did not vouchsafe a reply to the hereditary enemy of his race. He did not seem, however, to take offence at the interruption, but waiting patiently until the other had finished, he drew up his blanket around him, and rising to his feet, stood erect on the mound. The light of our fire was thrown full upon his attenuated features, and lit them up with almost as ruddy a glow as that which bathed the autumnal foliage behind him. He was mute for some minutes, and then spoke to this effect.

"Yes, they were here before my people. But they could not stay when we came, no more than the Red-man now can bide before the presence of the Long-knife. The Master of Life willed it, and our fathers swept them from the land. The Master of Life now wishes to call back his red people to the blessed gardens whence they first started, and he sends the Pale-faces to drive them from the countries which they have learnt to love so well as to be unwilling to leave them.

"It is good. Men were meant to grow from the earth like the oak that springs in the pine barren, or the evergreen that shoots from the ground where the tree with a falling leaf has been cut down.

"But listen, brother! Mark you the hue that dyes every leaf upon the tree? It is born of the red water with which its roots were nourished a thousand years ago. It is the blood of a murdered

race, which flushes every autumn over the land, when yearly the moon comes round that saw it perish from this ground."

**FOSTER'S FOREIGN QUARTERLIES, No. XIX:**  
New York, THEODORE FOSTER.—This number gives us the latest Westminster Review—which, however, we have not had time yet to look into.

*Extract from the third No. of the Crayon Miscellany.*

#### Legend of Count Julian and his Family.

In the preceding legends is darkly shadowed out a true story of the woes of Spain. It is a story full of wholesome admonition, rebuking the insolence of human pride, and the vanity of human ambition, and showing the futility of all greatness that is not strongly based on virtue. We have seen, in brief space of time, most of the actors in this historic drama disappearing, one by one, from the scene, and going down, conqueror and conquered, to gloomy and unhonored graves. It remains to close this eventful history, by holding up, as a signal warning, the fate of the traitor, whose perfidious scheme of vengeance brought ruin on his native land.

Many and various are the accounts given in ancient chronicles of the fortunes of Count Julian and his family, and many are the traditions on the subject still extant among the populace of Spain, and perpetuated in those countless ballads sung by peasants and muleteers, which spread a singular charm over the whole of this romantic land.

He who has travelled in Spain in the true way in which the country ought to be travelled; sojourning in its remotest provinces; rambling among the rugged defiles and secluded vallies of its mountains; and making himself familiar with the people in their out-of-the-way hamlets, and rarely visited neighborhoods, will remember many a group of travellers and muleteers, gathered of an evening around the door or the spacious hearth of a mountain venta, wrapped in their brown cloaks, and listening with grave and profound attention to the long historic ballad of some rustic troubadour, either recited with the true *ore rotundo* and modulated cadences of Spanish elocution, or chaunted to the tinkling of a guitar. In this way he may have heard the doleful end of Count Julian and his family recounted in traditional rhymes, that have been handed down from generation to generation. The particulars, however, of the following wild legends are chiefly gathered from the writings of the pseudo Moor, Rasis; how far they may be safely taken as historic facts, it is impossible now to ascertain; we must content ourselves, therefore, with their answering to the exactions of poetic justice.

As yet every thing had prospered with Count Julian. He had gratified his vengeance; he had been successful in his treason, and had acquired countless riches from the ruin of his country. But it is not outward success that constitutes prosperity. The tree flourishes with fruit and foliage while blasted and withering at the heart. Wherever he went, Count Julian read hatred in every eye. The Christians cursed him as the cause of all their woe; the Moslems despised and distrusted him as a traitor. Men whispered together as he approached, and then turned away in scorn; and mothers snatched away their children with horror if he offered to caress them. He withered under the execration of his fellow men, and, last, and worst of all, he began to loathe himself. He tried in vain to persuade himself that he had but taken a justifiable vengeance; he felt that no personal wrong can justify the crime of treason to one's country.

For a time, he sought in luxurious idleness to soothe or forget the miseries of the mind. He assembled round him every pleasure and gratification that boundless wealth could purchase, but all in vain. He had no relish for the dainties of his board; music had no charm wherewith to lull his soul, and remorse drove slumber from his pillow. He sent to Ceuta for his wife Frandina, his daughter Florinda, and his youthful son Alarbot; hoping in the bosom of his family to find that sympathy and kindness which he could no longer meet with in the world. Their presence, however, brought him no alleviation. Florinda, the daughter his heart, for whose sake he had undertaken this signal vengeance, was sinking a victim to its effects.—Wherever she went, she found herself a by-word of shame and reproach. The outrage she had suffered was imputed to her as wantonness, and her calamity was magnified into crime. The Chris-

tians never mentioned her name without a curse, and the Moslems, the gainers by her misfortune, spoke of her only by the appellation of Cava, the vilest epithet they could apply to woman.

But the approbrium of the world was nothing to the upbraiding of her own heart. She charged herself with all the miseries of these disastrous wars; the deaths of so many gallant cavaliers; the conquest and perdition of her country. The anguish of her mind preyed upon the beauty of her person. Her eye, once soft and tender in its expression, became wild and haggard; her cheek lost its bloom, and became hollow and pallid, and at times there was desperation in her words.—When her father sought to embrace her, she withdrew with shuddering from his arms, for she thought of his treason and the ruin it had brought upon Spain. Her wretchedness increased after her return to her native country, until it rose to a degree of frenzy.

One day when she was walking with her parents in the garden of their palace, she entered a tower, and, having barred the door, ascended to the battlements. From thence she called to them in piercing accents, expressive of her insupportable anguish and desperate determination. "Let this city," said she, "be henceforth called Malacca, in the memorial of the most wretched of women, who therein put an end to her days." So saying, she threw herself headlong from the tower, and was dashed to pieces. The city, add, the ancient chronicler, received the name thus given it, though afterwards softened to Mataga, which it still retains in memory of the tragical end of Florinda.

The Countess Frandina abandoned this scene of woe, and returned to Ceuta, accompanied by her infant son. She took with her the remains of her unfortunate daughter, and gave them honorable sepulture in a mausoleum of the chapel belonging to the citadel. Count Julian departed for Carthage, where he remained plunged in horror at this doleful event.

About this time, the cruel Suleiman, having destroyed the family of Muza, had sent an Arab general, named Alahor, to succeed Abdalasis as emir or governor of Spain. The new emir was of a cruel and suspicious nature, and commenced his sway with a stern severity that soon made those under his command look back with regret to the easy rule of Abdalasis. He regarded with an eye of distrust the renegade Christians who had aided in the conquest, and who bore arms in the service of the Moslems; but his deepest suspicions fell upon Count Julian, "He has been a traitor to his own countrymen," said he, "how can we be sure that he will not prove traitor to us?"

A sudden insurrection of the Christians who had taken refuge in the Asturian mountains, quickened his suspicions and inspired him with fears of some dangerous conspiracy against his power. In the height of his anxiety, he bethought him of an Arabian sage named Yuz, who had accompanied him from Africa. This son of science was withered in form, and looked as if he had outlived the usual term of mortal life. In the course of his studies and travels in the east, he had collected the knowledge and experience of ages; being skilled in astrology, and, it is said, in necromancy, and possessing the marvellous gift of prophecy or divination. To this expounder of mysteries Alahor applied to learn whether any secret treason menaced his safety.

The astrologer listened with deep attention, and overwhelming brow, to all the surmises and suspicions of the emir, then shut himself up to consult his books and commune with those supernatural intelligences subservient to his wisdom. At an appointed hour the emir sought him in his cell. It was filled with the smoke of perfumes; squares and circles and various diagrams were described upon the floor, and the astrologer was poring over a scroll of parchment, covered with cabalistic characters. He received Alahor with a gloomy and sinister aspect; pretending to have discovered fearful portents in the heavens, and to have had strange dreams and mystic visions.

"O emir," said he, "be on your guard! treason is around you and in your path; your life is in peril. Beware of Count Julian and his family."

"Enough," said the emir. "They shall all die! Parents and children—all shall die."

He forthwith sent a summons to Count Julian to attend him in Cordova. The messenger found him plunged into affliction for the recent death of his daughter. The count excused himself, on account of this misfortune, from obeying the commands of

the emir in person, but sent several of his adherents. His hesitation and the circumstance of his having sent his family across the straits to Africa, were construed by the jealous mind of the emir into proofs of guilt. He no longer doubted his being concerned in the recent insurrections, and that he had sent his family away, preparatory to an attempt, by force of arms, to subvert the Moslem domination. In his fury he put to death Siseburto and Evan, the nephews of Bishop Oppas, and sons of the former king. Witiza, suspecting them of taking part in the treason. Thus did they expiate their treachery to their country in the fatal battle of the Guadalete.

Alahor next hastened to Carthage to seize upon Count Julian. So rapid were his movements, that the Count had barely time to escape with fifteen cavaliers, with whom he took refuge in the strong castle of Merctello, among the mountains of Arragon. The emir, enraged to be disappointed of his prey, embarked at Carthage, and crossed the straits to Ceuta to make captives of the Countess Frandina and her son.

The old chronicle from which we take this part of our legend, presents a gloomy picture of the countess in the stern fortress to which she had fled for refuge; a picture heightened by supernatural horrors. These latter, the sagacious reader will admit or reject according to the measure of his faith and judgment; always remembering that in dark and eventful times like those in question, involving the destinies of nations, the downfall of kingdoms, and the crimes of rulers and mighty men, the hand of fate is sometimes strangely visible, and confounds the wisdom of the worldly wise, by intimations and portents above the ordinary course of things. With this proviso, we make no scruple to follow the venerable chronicler in his narration.

Now so it happened, that the countess Frandina was seated late at night in her chamber in the citadel of Ceuta, which stands on a lofty rock, overlooking the sea. She was revolving in gloomy thought the late disasters of her family, when she heard a fearful noise like that of the sea breeze moaning about the castle walls. Raising her eyes, she beheld her brother, the Bishop Oppas, at the entrance of the chamber. She advanced to embrace him, but he forbade her with a motion of his hand, and she observed that he was ghastly pale, and that his eyes glared as with lambent flames.

"Touch me not, sister," said he, with a mournful voice, "lest thou be consumed by the fire which rages within me. Guard well thy son, for blood hounds are upon his track. His innocence might have secured him the protection of heaven, but our crimes have involved him in our common ruin." He ceased to speak and was no longer to be seen. His coming and going were alike without noise, and the door of the chamber remained fast bolted.

On the following morning a messenger arrived with tidings that the Bishop Oppas had been made prisoner in battle by the insurgent Christians of the Asturias, and had died in fetters in a tower of the mountains. The same messenger brought word that the Emir Alahor had put to death several of the friends of Count Julian; had obliged him to fly for his life to a castle in Arragon, and was embarking with a formidable force for Ceuta.

The countess Frandina, as has already been shown, was of courageous heart, and danger made her desperate. There were fifty Moorish soldiers in the garrison; she feared that they would prove treacherous, and take part with their countrymen. Summoning her officers, therefore, she informed them of their danger, and commanded them to put those Moors to death. The guards sallied forth to obey her orders. Thirty-five of the Moors were in the great square, unsuspecting of any danger, when they were severally singled out by their executioners, and at a concerted signal, killed on the spot. The remaining fifteen took refuge in a tower. They saw the armada of the emir in the distance, and hoped to be able to hold out until its arrival. The soldiers of the countess saw it also, and made extraordinary efforts to destroy these internal enemies before they should be attacked from without. They made repeated attempts to storm the tower, but were as often repulsed with severe loss. They then undermined it, supporting its foundations by stanchions of wood. To these they set fire, and withdrew to a distance, keeping up a constant shower of missiles to prevent the Moors from sallying forth to extinguish the flames. The stanchions were rapidly consumed, and when they gave way the tower fell to the ground. Some of the Moors were crushed among the ruins; others were flung

to a distance and dashed among the rocks; those who survived were instantly put to the sword.

The fleet of the emir arrived at Ceuta about the hour of vespers. He landed, but found the gates closed against him. The countess herself spoke to him from a tower, and set him at defiance. The emir immediately laid siege to the city. He consulted the astrologer Yuza, who told him that, for seven days his star would have the ascendant over that of the youth Alarbot, but after that time the youth would be safe from his power, and would effect his ruin.

Alahor immediately ordered the city to be assailed on every side, and at length carried it by storm. The countess took refuge with her forces in the citadel, and made desperate defence, but the walls were sapped and mined, and she saw that all resistance would soon be unavailing. Her only thoughts now were to conceal her child. "Surely," said she, "they will not think of seeking him among the dead." She led him, therefore, into the dark and dismal chapel. "Thou art not afraid to be alone in this darkness, my child," said she.

"No, mother," replied the boy, "darkness gives silence and sleep. She conducted him to the tomb of Florida. "Fearest thou the dead, my child?" "No, mother, the dead can do no harm, and what should I fear from my sister?"

The countess opened the sepulchre. "Listen, my son," said she. "There are fierce and cruel people who have come hither to murder thee. Stay here in company with thy sister, and be quiet as thou dost value thy life!" The boy, who was of a courageous nature, did as he was bidden, and remained there all that day, and all the night, and the next day until the third hour.

In the mean time the walls of the citadel were sapped; the troops of the emir poured in at the breach, and a great part of the garrison was put to the sword. The countess was taken prisoner and brought before the Emir. She appeared in his presence with haughty demeanor, as if she had been a queen receiving homage. But when he demanded her son, she faltered, and turned pale, and replied, "My son is with the dead."

"Countess," said the emir, "I am not to be deceived: tell me where you have concealed the boy, or tortures shall wring from you the secret."

"Emir," replied the countess, "may the greatest torments be my portion, both here and hereafter, if what I speak be not the truth. My darling child lies buried with the dead."

The emir was confounded by the solemnity of her words; but the withered astrologer Yuza, who stood by his side regarding the countess from beneath his bushy eyebrows, perceived trouble in her countenance and equivocation in her words. "Leave this matter to me," whispered he to Alahor, "I will produce the child."

He ordered strict search to be made by the soldiery, and he obliged the countess to be always present. When they came to the chapel her cheek turned pale and her lip quivered. "This," said the subtle astrologer, "is the place of concealment."

The search throughout the chapel, however, was equally vain, and the soldiers were about to depart, when Yuza remarked a slight gleam of joy in the eye of the countess. "We are leaving our prey behind," thought he, "the countess is exulting."

He now called to mind the words of her asseveration, that her child was with the dead. Turning suddenly to the soldiers he ordered them to search the sepulchres. "If you find him not," said he, "draw forth the bones of that wanton Cava, that they may be burnt, and the ashes scattered to the winds."

The soldiers searched among the tombs and found that of Florida partly open. Within lay the boy in the sound sleep of childhood, and one of the soldiers took him gently in his arms to bear him to the emir.

When the countess beheld that her child was discovered, she rushed into the presence of Alahor, and forgetting all her pride, threw herself upon her knees before him.

"Mercy! mercy!" cried she in piercing accents, "mercy on my son—my only child! O emir! listen to a mother's prayers, and my lips shall kiss thy feet. As thou art merciful to him so may the most high God have mercy upon thee, and heap blessings on thy head."

"Bear that frantic woman hence," said the emir, "but guard her well."

The countess was dragged away by the soldiery

without regard to her struggles and her cries, and confined in a dungeon of the citadel.

The child was now brought to the emir. He had been awakened by the tumult, but gazed fearlessly on the stern countenances of the soldiers. Had the heart of the emir been capable of pity, it would have been touched by the tender youth and innocent beauty of the child; but his heart was as the nether millstone, and he was bent upon the destruction of the whole family of Julian. Calling to him the astrologer, he gave the child into his charge with a secret command. The withered son of the desert took the boy by the hand, and led him up the winding stair case of a tower. When they reached the summit Yuza placed him on the battlements.

"Cling not to me, my child," said he, "there is no danger." "Father, I fear not," said the undaunted boy, "yet it is a wondrous height!"

The child looked around with delighted eyes. The breeze blew his curling locks from about his face, and his cheek glowed at the boundless prospect; for the tower was reared upon that lofty promontory on which Hercules founded one of his pillars. The surges of the sea were heard far below, beating upon the rocks, the sea gulls screamed and wheeled about the foundations of the tower, and the sails of lofty carracks were as mere specks on the deep.

"Dost thou know yonder land beyond the blue water?" said Yuza.

"It is Spain," replied the boy, "it is the land of my father and my mother."

"Then stretch forth thy hands and bless it, my child," said the astrologer.

The boy let go his hold of the wall, and, as he stretched forth his hands, the aged son of Ishmael, exerting all the strength of his withered limbs, suddenly pushed him over the battlements. He fell headlong from the top of that tall tower, and not a bone in his tender frame but was crushed upon the rocks beneath.

Alahor came to the foot of the winding stairs.

"Is the boy safe?" cried he.

"He is safe," replied Yuza; "come and behold the truth with thine own eyes."

The emir ascended the tower and looked over the battlements, and beheld the body of the child, a shapeless mass, on the rocks far below, and the sea gulls hovering about it; and he gave orders that it should be thrown into the sea, which was done.

On the following morning, the countess was led forth from her dungeon into the public square.—She knew of the death of her child, and that her own death was at hand, but she neither wept nor supplicated. Her hair was dishevelled, her eyes were haggard with watching, and her cheek was as the monumental stone, but there were the remains of commanding beauty in her countenance, and the majesty of her presence awed even the rabble into respect.

A multitude of Christian prisoners were then brought forth; and Alahor cried out—"Behold the wife of Count Julian—behold one of that traitorous family which has brought ruin upon yourselves and upon your country." And he ordered that they should stone her to death. But the Christians drew back with horror from the deed, and said—"In the hand of God is vengeance, let not her blood be upon our heads." Upon this the emir swore with horrid imprecations that whoever of the captives refused should himself be stoned to death. So the cruel order was executed, and the Countess Frandina perished by the hands of her countrymen. Having thus accomplished this barbarous errand, the emir embarked for Spain, and ordered the citadel of Ceuta to be set on fire, and crossed the straits at night by the light of its towering flames.

The death of Count Julian, which took place not long after, closed the tragic story of his family.—How he died, remains involved in doubt. Some assert that the cruel Alahor pursued him to his retreat among the mountains, and, having taken him prisoner, beheaded him; others that the Moors confined him in a dungeon, and put an end to his life with lingering torments; while others affirm that the tower of the castle of Marcellino, near Huesca, in Arragon, in which he took refuge, fell on him and crushed him to pieces. All agree that his latter end was miserable in the extreme, and his death violent. The curse of heaven, which had thus pursued him to the grave, was extended to the very place which had given him shelter; for we are told that the castle is no longer inhabited on account of the strange and horrible noises that are heard in it; and that visions of armed men are

seen above it in the air; which are supposed to be the troubled spirits of the apostate Christians who favored the cause of the traitor.

In after times a stone sepulchre was shown, outside of the chapel of the castle, as the tomb of Count Julian; but the traveller and the pilgrim avoided it, or bestowed upon it a malediction; and the name of Julian has remained a by-word and a scorn in the land for the warning of all generations. Such ever be the lot of him who betrays his country.

Here end the legends of the conquest of Spain.  
Written in the Alhambra, June 10, 1829.

KOSCIUSZKO IN AMERICA.—Kosciuszko reached the new world utterly unprovided with letters of recommendation or introduction, and nearly penniless; he however asked an audience with Washington, to whom he had boldly presented himself.

"What do you seek here?" inquired the general, with his accustomed brevity.—"I come to fight as a volunteer for American Independence," was the equally brief and fearless reply.—"What can you do?" was Washington's next question; to which Kosciuszko, with his characteristic simplicity, only rejoined, "Try me." This was done—occasion soon offered, in which his talents, science, and valor were evinced, and above all his great character was duly appreciated. He was speedily made an officer and further distinguished himself.

"He had not been long in America, when he had occasion to display his undaunted courage, as captain of a company of volunteers. Generals Wayne and Lafayette, notwithstanding the heat of the battle in which they themselves were fully engaged, observed with satisfaction the exertions of that company, which advanced beyond all the rest, and made its attack in the best order.

"Who led the first company?" asked Lafayette of his comrades on the evening of that memorable day (the 30th of September.)

"The answer was, 'It is a young Pole, of noble birth, but very poor; his name, if I am not mistaken, is Kosciuszko.' The sound of this unusual name, which he could hardly pronounce, filled the French hero with so eager a desire for the brave stranger's acquaintance, that he ordered his horse to be immediately saddled, and rode to the village, about a couple of miles off, where the volunteers were quartered for the night.

"Who shall describe the pleasure of the one, or the surprise of the other, when the general, entering the tent (would it not rather be a room or a hut in a village?) saw the captain covered from head to foot with blood, dust and sweat, seated at a table, his head resting upon his hand, a map of the country spread out before him, and pen and ink by his side. A cordial grasp of the hand imported to the modest hero his commander's satisfaction, and the object of a visit paid at so unusual an hour.—[Foreign Quarterly Review.]

DEATH AND MONUMENT OF KOSCIUSZKO.—Kosciuszko's end was now at hand, but its approach was cheered by the sight of the object of his early and constant attachment, now Princess Lubomirska.

"The Princess, who was travelling to Geneva and Italy, stopped at Solothurn to spend some weeks with Kosciuszko, cheering the already declining old man by her agreeable pleasantries, and her rare gift of social wit. Kosciuszko had a presentiment that he should not see her again, and, when she bade him farewell with a promise to return the following spring, tears swelled into his eyes, and the agitated hero asked for a token of her remembrance. The princess accordingly sent him, from Lausanne, a ring, with the motto, 'Friendship to Virtue.' But when the ring reached Solothurn, Kosciuszko was no more!

"On the 1st of October, 1817, he was seized with a nervous fever, then prevalent at Solothurn, which in spite of his struggles, confined him to his bed. Foreseeing the event, he made his will, bequeathing ample legacies to his friends, the Zaltners, especially to Emilie, and others to the town hospital, the orphan house, and the poor of Solothurn. . . . He left 1000 francs for the expenses of his funeral, upon condition that his body should be carried to the grave by six poor men. . . . He ordered all his Polish papers to be burnt.

"After signing this will, he laid down the pen raised his eyes towards heaven and said, 'Now I

am easy!" He spoke often and long of his approaching end. His mind grew calmer and calmer, and voice and look bespoke the peace of his soul. . . . His parting with his beloved friends, the blessing he bestowed upon Zeltner, his wife, and children, had all the august solemnity of a religious ceremony. According to the custom of heroic times, he asked for his sword, that which had been shattered in his hand at Macziewice. To this broken sword he committed the guard of his ashes. The sabre of John K. Sobieski, which he had received in the year 1799, from his brothers in arms, he directed to be sent to Poland, and there preserved for other times and other deeds.\*

"He retained the full possession of his faculties to his last breath; but his pulse grew fainter. On the morning of the 15th, he awoke from a heavy sleep, and his eyes fell upon the whole Zeltner family, assembled round his bed. He seemed stronger, cheerfully stretched out his hand, and bade them good morning, with his wonted cordiality. But whilst he spoke his voice nearly failed, and he himself asked for his physician.

"Towards ten o'clock he raised himself, as though wishing to say something which required all his energies. He gave Zeltner his right hand, Madame Zeltner his left, smiled to his little friend Emilie, who stood at the bed's foot, and thus taking leave of three beloved beings at once, he sank slowly down, sighed—and his pure soul was in the presence of his Maker."

The body was embalmed, and, as he had directed, borne to the grave by poor old men, relieving each other. The funeral was attended by all Solothurn, for he was mourned by the whole canton, especially by the class so indebted to his liberality. His death was lamented, and his praises were celebrated by poets and orators in all languages. In Poland, the grief and mourning was universal: and at Warsaw, the funeral oration was pronounced by the national poet, the friend of his youth, Wiemcewicz.

But Poland grudged the remains of her noblest son to a foreign land, and Alexander readily sanctioned the national desire to bring them home.—The body was asked of Switzerland by a formal Polish embassy, which having obtained, escorted it to Poland. At Cracow it was received by the Senate, and with all military and civil honors interred in the cathedral. But the Polish Senate and the Polish nation wished to raise to their heroic champion a more peculiar and more enduring monument than other men can boast, at least in modern times.

"A monument that might be an object of general enthusiasm, of heart-felt veneration to all Poles. The senate decreed the raising of a mound (in fact a barrow,) upon the eminence called *Bronislaw* (meaning the guardian of fame,) which commands the Vistula. At this mound, young and old, senators and citizens, nobles and peasants, even the magnates of the realm, and the most delicate ladies, labored with their own hands. A countryman, who came from Volhynia to assist, accidentally received a severe wound; and in the fear that he might bleed to death, several persons were carrying him in quest of surgical assistance, when he resolutely exclaimed, 'Oh, let me bleed here! it is the only tribute I can pay to the great *Naczelnik*.'"

"From the 16th of October, 1820, to the 16th of October, 1823, the labor continued. The *Mogila Kosciuszki* (Kosciuszko's Mount,) measures 276 feet in diameter at the base, and 300 feet in height. It is the largest ever formed by human hands.

"The sepulchral mound of Queen Vanda, and of St. Cracus, respectively on the left and right banks of the Vistula, meet the traveller's view at some distance from Cracow, reminding him of the origin of the actual inhabitants of the country.—Kosciuszko's monument completes the triangle, and connects the present with the past. . . . A convenient road, paved and planted with trees, for pedestrians, leads thither; for, since the beginning of the work, this has been the favorite promenade of the Cracovians. . . . From the ample contributions of the whole country, an adjoining piece of ground was purchased, upon which, close to the old chapel of St. Bronislaw, houses were built for

\* It was preserved by Princess Czartoryska, in her noble collection of arms and other Polish antiquities, at her castle of Pulawy, until the year 1830; since then, who can tell its fate?

four peasants, who had served under Kosciuszko. It is their duty, and that of their families for ever, to plant the mound as pleasure grounds, and to take the greatest care of the *pomnik* (monument.)

"The management of the purchase, of the construction, and of the whole affair, was intrusted by the Cracow senate to a committee of twenty persons, with General Franciszek Paszowski as president. \* \* \* The expense was defrayed by contributions, not only of the most considerable families of Poland, but likewise of peasants, artisans, and private soldiers. Count Arthur Posocki alone gave 10,000 *gulden*, with which (we presume the expense of the monument being paid) three orphan kinswomen of Kosciuszko, whose existence had been but recently discovered, were portioned."—[Foreign Quarterly Review.]

[From the *Schoharie Republican*.]

KNOX CAVE.—The difficulties and dangers with which nature has surrounded many of her most magnificent works, seem, in the present age, to present no obstacles to the daring enterprise of man,—that spirit of inquiry in the cause of natural science, which has presented to the literary world, so many interesting operations of nature in her gloomy solitudes, has been recently stimulated by the discovery of objects for new investigation and redoubled effort.

A cavern, situate in the town of Knox, Albany county, on the land of Jacob Van Auker, about 11 miles east of Schoharie Court-house, has been recently explored—first by Mr. Thaddeus Chapman, who resides in its vicinity, and subsequently, Sept. 4th, 1835, more particularly, by Mr. Peter Osterhout and Doctor L. Hubbard, of this village, in company with Mr. Chapman.

The following is given as the result of their discoveries:

The first depression resembles the section of an inverted cone, three-fourths of the circumference being nearly perpendicular, the remainder gradually sloping until it meets the opposite edge; the distance of this descent is about forty feet. The second descent is perpendicular in the rock, thirty-eight feet. The walls on either side are regular, with the exception of a few slight projections.—The opening at the top forms nearly a triangle, the sum of whose sides is not far from 12 feet, three-fifths of which is covered by a large stone that has fallen from the overhanging rock; the opening at the bottom of this passage is about the same as at the top. The third passage is sloping, (occasionally interrupted by perpendicular spaces of a few feet,) for the distance of about 65 feet; this descent will form an angle with the horizon of not less than seventy degrees, and runs directly south. The fourth passage is about 6 feet in length, inclining to the west, a little sloping through a curiously wrought hole in the partition wall. This wall separates the two apartments of the cave. Were it not for this provision of nature, what remains below must have forever remained among the hidden secrets of its Maker. The hole is nearly round, and just large enough to admit a person either head or feet foremost. The fifth passage extends both to the north and the south of the fourth, running parallel with the second and third; to the north the passage is free for about fifty feet, when it is choked up by clay, which has been washed from above; this passage is from three to four feet wide, and probably not less than 100 feet in height.—To the South it extends about forty feet, and terminates in a beautiful colonnade: the columns are arranged in a circular form, including a space of about fifteen feet in circumference; the columns are formed of calcareous spar, and are from ten to twenty feet in length, and from 6 to 14 inches in diameter; on the west side the columns are straight and regular, on the east they are interrupted by a mass of spar which has formed under them; this mass has an oval form, 8 feet in length and 10 in height, and three in its greatest diameter; the sides are fluted out and formed into the resemblance of pillars; the whole mass has the appearance of being supported on pillars; the top is flat and circular, resembling a lady's toilet table; the surface is beautifully cushioned over with an oval burr-like formation, and the border or edge is hung with numbers of flat stalactites of different lengths, the edges are notched out so that they resemble fringe; the walls rise from the top of this beautiful formation, about fifteen feet, and meet the roof, which is considerably lower than the roof in the fifth passage; the sides of the columns rising from the table, are hung with an immense number of

stalactical formations; so also the roof above.—The colonnade opens into a hall, (so called to designate it from the room we shall presently describe,) the floor of which is about 8 feet lower than that of the colonnade; it is about 30 feet long, 15 wide and 30 high. These walls are also ornamented with various formations of spar; great numbers of stalactites are seen pending from the roof and sides; at the south western angle of the hall is a crevice, extending about 15 feet, at the extremity of which, is a stalactical formation resembling in form and size, a large lamp, (such as are used for lighting cities,) the bottom is curiously fringed with small flat stalactites; at the northwestern angle of this hall is a passage descending to the north; it has been explored for about 30 feet; the mud prevented us going farther. From this we pass into the large room, (or as it was fancifully called by young Chapman) the grand saloon. This room is about forty feet long and twenty wide, and from fifteen to twenty feet in height; the hall and roof are remarkably regular and encrusted with spar on all sides; the roof is pierced with three rows of holes, passing nearly its whole length. These holes are placed at nearly equal distances, and have the appearance of being placed there for ornament.—At the northern extremity of the room, the roof parts at the centre, and forms two large prongs; the one passes to one side of the colonnade and the other to the opposite side, and apparently resting on its columns; about the middle of the western side of this room, is a passage extending about 150 feet to the west, this passage varies in width from 6 to 8 feet; in some places the roof is very high, and in others, the rocks fall within a few feet of the floor. This passage is lined with sparry incrustations from one end to the other; stalactites, stalagmites, and alabaster, of the purest kind are found here. We procured a stalactite from this passage 4 feet 5 inches in length, the top of which very much resembles a man's head with a warrior's helmet; here we also procured the fragments of a stalactical formation of about 6 inches in diameter, and 8 feet in length, which had fallen from a crevice and broken; other pieces of the same mass were seen lodged in the crevice above; and judging from the piece we have, and those in sight, we should say that it could not have been less than 11 or 12 feet in length; this mass is formed of the purest alabaster, with the exception of a streak of about 2 inches wide and 1 1/2 thick, (which appears to have traversed its whole length) which is formed of the purest kind of satin spar.

The above is given by the gentleman from this village, as a very hasty and deficient account of this interesting cavern. Doct. L. Hubbard, who first entered Ball's Cave in Schoharie, pronounces that much celebrated cavern far inferior in grandeur of appearance to the one above mentioned, and gives it preference only in novelty, resulting from its subterranean navigation.

LATER FROM ENGLAND.—By the packet ship *Britannia*, Waite, from Liverpool, we have received our regular files of London and Liverpool papers to the 1st of September.

The accounts from the Continent are not so late as previously received: the *Sully*, from Havre.

In the House of Commons, on the 29th August, the Chancellor brought forward a bill, to amend the bill, for the tithe owners in Ireland. It was to have been considered on the Monday following.

Accounts from Bombay of the 27th April, state that, in consequence of the failure of the crop, Cotton had taken a great rise in that market. It was estimated that the shipments to Great Britain and China would not exceed 40,000 bales, and the stock then on hand was only 1000 bales.

For markets, &c. see Commercial intelligence.

LONDON, Aug. 29, Evening.—The consideration of the appropriation clause in the consolidated fund bill, has been again postponed by the Chancellor of the Exchequer. The corporation bill was brought back to the Commons, with its mutilations, on Friday. Mr. Spring Rice, on behalf of the Government, moved that the bill, with its amendments, be printed, and taken into consideration on Monday, for which day he bespoke a full attendance of members, expressing his conviction that the subject would then receive a calm and deliberate, but at the same time resolute decision. The use of the term "resolute," and the manner in

which it was caught up and cheered by the House, sufficiently indicate the temper of the House, and the intentions of Government with regard to the measure. The further postponement of the supplies also indicates a steady determination on the part of the present administration not to be undermined by their opponents. It is clear that the members of the cabinet, who, no doubt, have good information of what is passing in the enemy's camp, anticipate some desperate attempt at circumvention, and feel the necessity of guarding against surprise. The last hope of the Tories is understood to be placed in a dissolution and new election before the last registration comes into play after the circuits of the revising barristers.

**LATER FROM EUROPE.**—The packet ship England, has arrived, with London papers of the 8th ult. We have not received our files as yet, but are indebted to the Captain for a paper of the 7th, with Paris dates of the 5th.

The Municipal Reform Bill, and the amendments made by the Lords, had been considered in the House of Commons, with a spirit of great forbearance and conciliation, and after being further amended, the bill was sent back to the Lords on Thursday, 3d Oct. There the Peers had partially disagreed to some of these amendments—notwithstanding the great concession made by the House of Commons, for the sake of harmony.

The Times, which now strenuously supports the upper House, disapproves this proceeding on its part, and recommends most strongly, that the Bill, as sent from the House of Commons, should be past. Upon the whole the probability of this bill's now passing, without a rupture between the two houses, is much increased.

The French papers of Friday 4th, are filled with accounts from various parts of Spain. According to a telegraphic despatch in the *Moniteur*, the Navarrese insurgents were, on the 31st, at *Organsia*, menaced by *Gurres* and *General Pastor*. Madrid appears tranquil.

The British Legion, under General Evans, had their first affair on the 29th, at *Oranendi*, where they attacked and carried some buildings fortified by the Carlists, whom they dispersed, killing and capturing some 150 of the enemy.

*Don Carlos* seems to have no settled plan of acting, and his movements were very uncertain.

**MONEY MARKET AND CITY INTELLIGENCE.**—**SATURDAY EVENING, 5th.**—Notwithstanding the difficulties by which the progress of the Municipal Reform Bill was impeded last night in the House of Lords, no effect was produced on the funds, the general impression remaining the same as yesterday, after the spirit of mutual concession displayed on both sides, that all will be amicably adjusted. The English funds have been perfectly steady, at about 1-8th per cent. lower than yesterday, consols leaving off at 90 1-2 to 5-8ths. Letters from *Genoa* mention that the ravages of cholera in that city were increasing.

**LIVERPOOL, Oct. 7.**—On Friday last Lucien and Joseph Bonaparte arrived at the Adelphi Hotel, from Chester. Joseph is on his return to America, and will embark to-morrow on board the Philadelphia packet ship *Monongahela*, in the Prince's Dock.

Since the above, we have been favored by the Evening Post with their papers—ours having failed—to 7th ult. We have not time, however, to add details, and the above summary comprises the substance of every thing important. In the *Liverpool Advertiser*, we find the following annunciation of the death of Mr. Barry:

On Sunday, the 30th ult., at the Star and Garter Inn, Paradise street, his Excellency Wm. T. Barry, Minister Plenipotentiary of the United States to the Court of Madrid, aged 53.

**IMPORTANT FROM MALAGA.**

Captain HARTSHORN, of ship *EMPEROR*, from Malaga, states that a revolution had broken out at Andalusia, Seville, Malaga, and Granada, on the 23d and 24th August. The Constitution of 1812 was proclaimed, and all the Friars at Malaga were imprisoned on the 23d. A number were killed and wounded.

The government troops were overpowered, and all who would not declare in favor of the new Constitution were either shot or imprisoned. There was great joy on the occasion, and the entire place illuminated. Tranquility had, in a measure, been restored when Captain H. left.

Capt. Hartshorn also states that the heavy rains on the 3d and 4th Sept. had seriously injured the fruit, and that nearly all the grapes were destroyed.

**COMMERCIAL BANK OF ALBANY.**—The Albany Journal of last evening furnishes the following official statement respecting this bank.

**THE COMMERCIAL BANK.**—The disappearance of Henry Bartow, late Cashier of the Commercial Bank of Albany, has naturally created much excitement, as it did the astonishment of the Directors and persons connected with that institution, and given rise to various rumours concerning its solvency. In consequence of the publication of an article in the Journal of Commerce, of New-York, stating the capital of the Bank at \$240,000, and an embezzlement of \$210,000 by the late cashier, the Directors deem it proper to apprise the public, that the capital of the Bank actually paid in is \$300,000, together with a net surplus of \$79,263, making the total amount of capital \$379,263. The Directors are not apprised of defalcations to the amount of \$130,000; which, if it should be that sum, will leave an unimpaired capital of \$249,263. Although a partial loss is thus sustained by the Stockholders, the Directors are enabled, from the examinations made, to give the assurance that in no event can injury or loss accrue to others.

Besides, by the terms of the Charter of this Bank, the Stockholders are individually responsible to double the amount of the original capital, being \$600,000. The business of the Bank will not be suspended, and all notes, drafts, and deposits will be paid on demand.

JOHN TOWNSEND, President.  
WILLARD WALKER, Vice Pres't.  
GEORGE W. STANTON,  
JOHN L. SCHOOLCRAFT,  
WILLIAM NEWTON,  
LEWIS BENEDICT,  
JAMES HORNER,  
JOHN GOTT,  
SETH HASTINGS,

Directors.

N. B.—The other Directors are at present absent from the City.  
Albany, October 13, 1835.

**LANDS SOLD FOR TAXES.**—In obedience to a resolution of the last Legislature, the Comptroller made a report giving a statement of all the sales of lands for taxes not heretofore reported; also the sales of lands for arrears of quit rents in 1836. This statement gives the location and description of the lot, the number of acres sold, the amount for which sold, the name of the purchaser, and the name of the person to whom conveyed. The report makes a volume of over 700 pages of the size of the legislative documents; and an extra number of copies have been printed sufficient to furnish the clerk of each town and ward with one copy. These have been forwarded to the treasurers of the several counties in the state, and each town clerk will be furnished with a copy by calling on the treasurer of his county.

In 1826, a similar report was made to the legislature, which may be referred to, (on application at the county clerk's office,) being document E. of the appendix, in the Assembly Journals of 1826.

These two reports contain lists of all the lands which have been sold for taxes in this state, and which have not been redeemed.

Persons who are interested in lands would do well to refer to these reports, and ascertain whether the lands in which they are interested have been affected by any of the Comptroller's sales. Lands are sometimes assessed and returned erroneously, and in such cases the payment of taxes annually is not sufficient to protect the land from sale: To guard against errors hereafter, every owner of lands should give the assessors the correct number and description of his lands, and as far as prac-

ticable should examine the assessment roll and ascertain for himself whether the right number and description is given to his lands in the assessment roll: if he finds one of his lots omitted in the list of resident assessments, he may be assured that although he is not called upon for the tax by the town collectors, the lot will be returned as non-resident, and in four or five years afterwards will be sold for taxes. Cases of this kind have frequently occurred.

To facilitate examinations, an index to the patents has been prepared and is annexed to the Comptroller's reports before referred to. In making examinations search ought to be made in the index, under every title by which a tract is known, although found in one or more places under the title first searched for: because tracts are sometimes returned to the Comptroller by one of their titles, and sometime by another.

Land sold for taxes in 1834, may be redeemed until the 21st day of April, 1836, and the several editors in the State might essentially serve the interests of their readers by calling attention, in an editorial article, to the Comptroller's notice on this subject, which is directed to be published in every paper in the State.—[Albany Argus.]

**NEW-ORLEANS, Sept. 28.**—The health of New-Orleans continues good; and we have reason to conclude with many experienced persons long resident here, that the yellow fever has ceased as an epidemic in New-Orleans.

[From Blackwood's Magazine for July.]

**The Ship.**

Where art thou going, mighty ship?  
Thy sails are on the wind,  
And the ocean, with a roaring sweep,  
Is racing on behind.  
The sea-birds wheel above thy mast,  
And the waters fly below,  
And the foaming billows, flashing fast,  
Are leaping by the prow.  
And midst the clouds thy fluttering flag  
Is streaming strong and well,  
As if to bid yon beacon crag  
A last and gay farewell.  
Where art thou going? "Far away,  
To seek a distant shore—  
Gaze ye upon me while ye may,  
You will not see me more."  
"My flag is dancing in the sky,  
My sails are on the breeze,  
And the wild bird screams exultingly,  
As we bound along the seas."  
"A hundred guns are on my deck,  
And a thousand men below—  
And my wings are spread without a speck,  
As white as driven snow."  
"Gaze while ye may—ye can but see  
My panoply and pride—  
Ye can but hear the hissing sea  
Dashed gayly from my side."  
"Hush! bootless sobs and yearning sighs,  
Ye broken hearts be still!  
Lest yonder landman's envious eyes  
Dream we have aught of ill—  
Lest he should think of care or war  
Amidst our gallant crew,  
Our souls that hear the bilboe winds blow,  
With cheeks of ashen hue."  
"Hurrah! hurrah! our homes we quit,  
And those who are therein—  
Will they be safe and standing yet,  
When we cross the waves again?"  
"Hurrah! hurrah! a glorious land  
Is rising far away  
What grave upon that stranger land  
Shall wrap our unknown clay!"  
"Hurrah! hurrah! beneath our keel  
A thousand fathoms sleep—  
And fleets are there—but with hearts of steel  
We'll gayly o'er them sweep."  
"On—on—the worm is at our heart,  
But the shout upon our lip—  
And who shall play the craven's part,  
In our proud and gallant ship?"  
"And who shall let the groan be heard  
Which lips are knawed to save—  
Or the tears be seen, that without a word,  
Are filling on the wave?"  
"On—on—the sea-birds heed us not—  
And the shores are sinking fast—  
And scarce the landman from his cot  
Can see our lessening mast—  
"But sighs him as he turns away  
To turn his evening hearth,  
That aught should be so proud and gay  
Without one care of earth."

**RAILROAD IRON WORK,**

Of all kinds, made to order by GODWIN, CLARK & CO., Paterson, New-Jersey.  
CAR WHEELS, BOXES, AXLES, and CAR SPRINGS, made and fitted complete, at short notice, and fair prices.  
Orders addressed to them at Paterson, N. J., or 24 Broad street, N. Y., will meet with immediate attention.  
Paterson, Aug. 19, 1835.

## LOCK GATES, FOR CANALS.

DAVID WILKINSON, of Coboes, Albany county, State of New-York, have obtained Letters Patent for the United States for an improvement in Lock Gates, &c., invites the attention of engineers and constructors to his invention, the result of thirty years' practical experience. The chief feature of his invention is the SELF-ADJUSTING VALVE GATE, which is opened in a great degree by the force of the water, and is closed by the weight of the valve gate, rods and screws, and kept secure and close by a pall; the improvement requiring very little force, in aid of the power of the water, to raise the valve gate. The Lock Gate is kept perfectly tight, or free from sagging, by the method of adjusting the anti-friction roller upon the quadrant or circular railway. By means of a thimble on the capstan, the chain for moving the gate can never become tangled or ride on the capstan, and by means of a pall in the head of the capstan, it can never be turned the wrong way, thus effectually guarding against much danger.

There is a lock in operation at Hogansburgh, New-York, where the experiment has been fully tested, to the satisfaction of all scientific men who have viewed it, and which has a self-adjusting valve gate, opening an aperture five feet in length, by 18 inches in width, under a pressure of 84 feet lift.

Having transferred the Letters Patent to Mr. JOHN L. WILKINSON, canal contractor, rights to construct under the same, may be obtained from him by applications addressed to Coboes P. O. Competent workmen to construct the gates and put them into operation, will be supplied, if desirable, either by the inventor or the assignee.

The following letter, from Judge WRIGHT, of New-York, one of the most experienced engineers in the United States, is conclusive with respect to the character of this gate:

"Moulinette, (U. Canada,) Aug. 14, 1835.

"DEAR SIR: I have here witnessed a trial of a new paddle gate invented by David Wilkinson, Esq., for Locks, to be introduced into the gates. It is 5 feet long, by 18 inches wide; and I am certain it is the best improvement of the kind which has been tried in this country. I think it will not get out of order, and is so simple, that a 12 years' old boy will open it; and there is no danger of throwing persons into the lock, from the operation, as nothing of the kind can happen.

"I think you will be much pleased with it. It applies its use to any head which can be used in locks, and is more particularly superior in the gates of the lock, to fill and empty rapidly, as easy as you please.

"I am, very respectfully, dear sir, your obedient servant,

"BENJ. WRIGHT.

"To EDWARD P. GAY, Esq.,  
Civil Engineer, Lancaster, Pa."

To which is added the testimonial of J. B. MILLS, Esq., Engineer, who has been associated with the greatest works of internal improvement in the Union:

"Mr. Wilkinson has recently invented a VALVE for Lock Gates, which is undoubtedly of great value, and readily applied. Mr. W. has the contract for constructing the Lock Gates upon the St. Lawrence Canal, (which is the largest upon this continent,) where it is determined to adopt his valve, and his manner of working the same. Having the utmost confidence in Mr. W.'s valve, having seen it applied, I most confidently commend it to all those interested in the construction of Canal Locks.

"J. B. MILLS,

"Engineer St. Lawrence Canal.  
Corwall, (U. C.), Aug. 21, 1835."

## TO CONTRACTORS FOR EXCAVATION AND MASONRY.

PROPOSALS will be received at the Office of the Philadelphia and Reading Railroad Company, in Philadelphia, on the 19th and 20th days of October next, for the Grading and Masonry, of about sixteen miles of the Railroad between Pottsgrove and Norristown.

In this distance, a large amount of heavy work, deserving the attention of skillful and competent Contractors, is to let. The Jobs of most magnitude, are a Tunnel 600 yards long, and a Bridge across the Schuylkill, near Phoenixville.

Plans and profiles of the line, and drawings of the different constructions on it will be exhibited, and all other information in relation to it will be afforded, on application at the Engineer's Office, at Pottsgrove, for ten days previous to the letting.

MONCURE ROBINSON, C. E.  
Philadelphia, Sept. 2, 1835.

## NEW-ORLEANS AND NASHVILLE RAILROAD.

## NOTICE TO CONTRACTORS.

The New-Orleans and Nashville Railroad Company having decided to place under contract the first fifty miles of the Road, on the 15th day of December next, Proposals will be received at their Office, in the City of New-Orleans, from the 15th of November to the 15th day of December next, for the Grading and Bridging of the same.

The Superintending Engineer, R. S. Smith, will be upon the ground to give every explanation relative to the manner of making Proposals, and such other information as may be required.

Of persons not personally known to the Engineer, there will be required certificates of character and qualifications.

This part of the road, extending along the shore of Lake Pontchartrain, is perfectly healthy throughout, and being the commencement of the most extensive work in the world, it cannot fail to be of great importance to Contractors to identify themselves with the work at its commencement, as those who are known to the Company as responsible and efficient will certainly be preferred to strangers during the future progress of the road.

The country through which the line passes is generally high pine ridge, and perfectly healthy.

H. J. RANNEY,  
Chief Engineer N. O. & N. Railroad.  
Engineer Office, N. O. & N. Railroad,  
Aug. 25, 1835.

## TO TUNNEL CONTRACTORS.

Proposals will be received by mail, or otherwise, for excavating a Tunnel on the summit of the Sandy and Beaver Canal. The Tunnel is 900 yards long, the material to be removed is a soft sand-stone rock, the highest part of the ridge through which it passes is about 90 feet above the top of the Tunnel. As the deep cuts at the termination are not excavated, most of the material will have to be removed through shafts. Proposals must be accompanied with good recommendations, as to skill and competency.

E. H. GILL,  
Engineer.  
38-61

New-Lisbon, Ohio, Sept. 17, 1835.

## RAILROAD IRON.

300 tons of Railroad Iron of the T pattern, just imported and for sale by  
HOWLAND & ASPINWALL,  
35 South street.

## AMES' CELEBRATED SHOVELS, SPADES, &amp;c.

500 dozens Ames' back-strap and plain Shovels,  
75 do do round-pointed do  
150 do do cast steel Shovels and Spades,  
100 do do Socket Shovels and Spades,  
150 do do steel plated Spades.

Together with Pick Axes, Churn Drills, and Crow Bars, steel pointed, made from Salisbury refined iron. For sale by his Agents,

WITHERELL, AMES & CO.  
2 Liberty street, New-York.  
BACKUS, AMES & CO.  
8 State street, Albany.

34-yf

## RAILROAD CASTINGS.

MANY & WARD, Proprietors of the Albany Eagle Air Furnace and Machine Shop, will make to order car wheels, chairs and knees, and every other description of castings required for railroads.

R-ly feb14.

## AUBURN AND SYRACUSE RAILROAD. NOTICE TO CONTRACTORS.

Sealed Proposals will be received until the 15th day of October next, at noon, by the undersigned, Chief Engineer and Agent of the Auburn and Syracuse Railroad Company, for the Grading, Masonry, and Bridges on said Road.

Individuals disposed to contract for the execution of the whole or any part of the work, will be furnished on application at the Office of the Company in Auburn, with blank forms of proposals, and printed specifications.

The contracts will be formed in the usual manner—a specific price being stated for each item of work, which price is to include the cost of material and labor required in rendering the work complete.

The proposals to be accompanied with the names of sureties, and where the parties are unknown to the undersigned or resident Engineers, the usual certificates of character and solvency will be required.

Individuals who have been employed on other works, must furnish satisfactory recommendations from the Engineer or Superintendents of the same. A rigid adherence to the conditions of each contract will in all cases be required.

It is desired that all the work in each section, including Grading, Culverts, and Bridges, should be embraced in the same contract, and it is requested that the proposals be made accordingly.

The plans of the different structures will be ready for examination at the Office aforesaid, by the 1st day of October next.

EDWIN F. JOHNSON,  
Chief Engineer & Agent A. & S. R. Company.  
Auburn, Aug. 22, 1835.

STEPHENSON,  
Builder of a superior style of Passenger Cars for Railroads.  
No. 264 Elizabeth street, near Bleeker street, New-York.

RAILROAD COMPANIES would do well to examine these Cars: a specimen of which may be seen on that part of the New-York and Harlem Railroad now in operation.

## RAILROAD CAR WHEELS AND BOXES AND OTHER RAILROAD CASTINGS.

Also, AXLES furnished and fitted to wheels complete at the Jefferson Cotton and Wool Machine Factory and Foundry, Paterson, N. J. All orders addressed to the subscribers at Paterson, or 60 Wall street, New-York, will be promptly attended to.

Also, CAR SPRINGS.  
Also, Flange Tires turned complete.

JR ROGERS, KETCHUM & GROSVENOR

## PATENT RAILROAD, SHIP AND BOAT SPIKES.

The Troy Iron and Nail Factory keeps constantly for sale every extensive assortment of Wrought Spikes and Nails, from 3 to 10 inches, manufactured by the subscriber's Patent Machinery, which after five years successful operation and now almost universal use in the United States (as well as England, where the subscriber obtained a Patent,) are found superior to any ever offered in market.

Railroad Companies may be supplied with Spikes having countersink heads suitable to the holes in iron rails, to any amount and on short notice. Almost all the Railroads now in progress in the United States are fastened with Spikes made at the above named factory—for which purpose they are found invaluable, as their adhesion is more than double any common spikes made by the hammer.

All orders directed to the Agent, Troy, N. Y., will be punctually attended to.

HENRY BURDEN, Agent.

Troy, N. Y. July, 1831.  
Spikes are kept for sale, at factory prices, by I. & J. Townsend, Albany, and the principal Iron Merchants in Albany and Troy; J. I. Brower, 223 Water street, New-York; A. M. Jones, Philadelphia; T. Janviers, Baltimore; Degrand & Smith, Boston.

P. S.—Railroad Companies would do well to forward their orders as early as practicable, as the subscriber is desirous of extending the manufacturing so as to keep pace with the daily increasing demand for his Spikes.

H. BURDEN.

## TO TUNNEL MINERS, DRILLERS, &amp;c.

Wanted, immediately, 50 Tunnel Miners, (Cornish Miners will be preferred,) 50 Drillers, 50 Laborers, and two experienced Mine Blacksmiths, on the New York and Harlem Railroad, about five miles from the City. Liberal wages will be given, and cash payments made every fortnight. Apply at Mr. FOWLER'S, St. John's Hall, Frankfort street, New-York.

JOHN BUTTER, Contractor.

The Albany Argus, Philadelphia U. S. Gazette and Pennsylvania, will please copy this, and send their bills to the Railroad Company, 14 Wall street, New-York. 23-1f

## PATENT HAMMERED SHIP, BOAT, AND RAILROAD SPIKES.

Railroad Spikes of every description required, made at the Albany Spike Factory.

Spikes made at the above Factory are recommended to the public as superior to any thing of the kind now in use. Ship and Boat Spikes made full size under the head, so as not to admit water.

Orders may be addressed to Messrs. ERASTUS CORNING & CO., Albany, or to THOMASTURNER, at the Factory, Troy, N. Y. sep.12 ly

## RAILWAY IRON.

250 tons of 1 inch by 1 inch, Flat Bars in lengths of 300 do. 1 1/2 do. 14 to 15 feet, counter sunk 40 do. 1 1/2 do. holes, ends cut at an angle 800 do. 2 do. of 45 degrees, with splicing plates and nails to suit. 800 do. 2 1/2 do. soon expected.

250 do. of Edge Rails of 36 lbs. per yard, with the requisite chairs, keys and pins.

Wrought Iron Rims of 30, 33, and 36 inches diameter for Wheels of Railway Cars, and of 60 inches diameter for Locomotive wheels.

Axles of 24, 28, 30, 32, 34, and 36 inches diameter for Railway Cars and Locomotives of patent iron.

The above will be sold free of duty, to State Governments and Incorporated Governments, and the Drawback taken in part payment.

A. & G. HALSTON.

Models and samples of all the different kinds of Rails, Chairs, Pins, Wedges, Spikes, and Splicing Plates, in use both in this country and Great Britain, will be exhibited to those disposed to examine them.

9 South Front street, Philadelphia. dtmewr

## SURVEYORS' INSTRUMENTS.

Compasses of various sizes and of superior quality warranted.

Leveling Instruments, large and small sizes, with high magnifying powers with glasses made by Troughton, together with a large assortment of Engineering Instruments, manufactured and sold by

E. & G. W. BLUNT, 154 Water street, corner of Maiden lane.

## SURVEYING AND ENGINEERING INSTRUMENTS.

The subscriber manufactures all kinds of Instruments in his profession, warranted equal, if not superior, in principles of construction and workmanship to any imported or manufactured in the United States; several of which are entirely new, among which are an Improved Compass, with a Telescope attached, by which angles can be taken with or without the use of the needle, with perfect accuracy; also a Railroad Goniometer, with two Telescopes—and a Leveling Instrument, with a Goniometer attached, particularly adapted to Railroad purposes.

WM. J. YOUNG,  
Mathematical Instrument Maker,  
No. 9 Dock st., Philadelphia.

The following recommendations are respectfully submitted to Engineers, Surveyors, and others interested.

In reply to thy inquiries respecting the instruments manufactured by thee, now in use on the Baltimore and Ohio Railroad, I cheerfully furnish thee the following information. The whole number of Levels now in possession of the department of construction of thy make is seven. The whole number of the "Improved Compass" is eight. These are all exclusive of the number in the service of the Engineer and Graduation Department.

Both Levels and Compasses are in good repair. They have in fact needed but little repairs, except from accidents to which all instruments of the kind are liable.

I have found that thy patterns for the levels and compasses have been preferred by my assistants generally, to any others in use, and the Improved Compass is superior to any other description of Goniometer that we have yet received in laying the rails on this Road.

This instrument, more recently improved with a reversing telescope, in place of the vane sights, leaves the engineer scarcely any thing to desire in the formation or convenience of the Compass. It is indeed the most completely adapted to lateral angles of any simple and cheap instrument that I have yet seen, and I cannot but believe it will be preferred to all others now in use for laying of rails—and in fact, when known, I think it will be as highly appreciated for common surveying.

Respectfully thy friend,  
JAMES F. STABLE, Sup't of Construction of Baltimore and Ohio Railroad.

Philadelphia, February, 1835.  
Having for the last two years made constant use of Mr. Young's "Patent Improved Compass," I can safely say I believe it to be much superior to any other instrument of the kind, now in use, and as such most cheerfully recommend it to Engineers and Surveyors.

E. H. GILL, Civil Engineer.  
Germantown, February, 1835.

For a year past I have used Instruments made by Mr. W. J. Young, of Philadelphia, in which he has combined the properties of a Theodolite with the common Level.

I consider these Instruments admirably calculated for laying out Railroads, and can recommend them to the notice of Engineers as preferable to any others for that purpose.

HENRY B. CAMPBELL, Eng. Philad.  
German and Norrist. Railroad

## AMERICAN RAILROAD JOURNAL.

NEW-YORK, OCTOBER 24, 1836.

Those of our readers who are engaged in the construction of Railroads, are requested to look at the notice of the *Boston and Norwich Railroad Company*, who advertise the letting of the first section of their Road, from Norwich to Jewett City.

**LONG ISLAND RAILROAD.**—The proceedings of a large meeting at Williamsburgh, concerning the route of this road at its western termination, will be found in our columns—and deserve attention.

**RAILROADS IN ALABAMA.**—We perceive by a late "North Alabamian," published at Tusculumbia, that measures are in progress to construct a Railroad from Mobile to the Tennessee Valley—a convention is to be held at Tusculooosa on the 4th Monday in November, for the purpose of promoting that important object. That a road will be constructed, and within a few years too, which shall extend from Mobile to the valley of the Tennessee, we have not a doubt; nor do we doubt but that other roads will be constructed to connect this road with one of the *Atlantic cities*, and also with the New-Orleans and Nashville Road, which is already in progress—and when completed will be one of the greatest roads in the Union. Such are the resources of the South,

and such its facilities for Railroads, that all great thoroughfares will eventually be by Railroads—and if fanaticism and misguided zeal does not disunite the States, we of the North will construct roads to meet theirs, when we shall become better known to each other, and have less to apprehend from sectional jealousies.

**BLACK RIVER CANAL.**—We find in the Lewis county Republican of the 13th inst., the following account of the proceedings of a convention called for the purpose of devising measures to forward the construction of a Canal to connect the waters of the Black River with the Erie Canal. We are gratified to find the people of that neglected section of the State moving upon the subject. It is a work of great importance to them, and they have only to require it to be done, and the work will certainly be constructed. They have our best wishes for its early completion, and we tender to them the columns of this Journal, if they think it can in any manner promote the best interests of the work.

### BLACK RIVER CANAL CONVENTION—GREAT MEETING.

A Convention of Delegates from the counties of Oneida, Lewis, Jefferson, and St. Lawrence, interested in the construction of the Black River Canal, was holden at Lowville in the county of Lewis on the first day of October inst. in pursuance of a resolution of a public meeting previously held at that place, for the purpose of taking into consideration the subject of the said Canal, and devising such means as should be thought most efficient in procuring the passage of a law for its construction.

The object of the convention was briefly and pertinently stated by James T. Watson, Esq., of Lowville, and the convention was organized by the appointment of Patrick S. Stewart, Esq., of Le Ray, chairman pro tem.

On motion, it was resolved that a committee of five be appointed by the chairman to report to the convention suitable persons for officers to preside over its deliberations.

The chairman nominated the following committee. M<sup>rs</sup>. Charles Dayan, of Lowville, Joseph Graves, Esq., of Rutland, Ohi-

ver Child, of Le Ray, Harrison Blodget, of Denmark, and Gen. Eli Merriam, of Leyden.

The committee reported the following persons: Sylvester Miller, Esq., Pres't.; Hon. Micah Sterling, of Watertown, A. L. Madison, of Gouverneur, Lemuel Hough, of Remsen, and Homer Collins, of West Turin, Vice Pres'ts; John W. Tamblin, of Le Ray, Henry Graves, of Boonville, and Hervey Brayton, Sec'ys.

On calling the lists of delegates appointed to attend the said convention, it appeared that 233 were present.

Mr. Stryker, of Rome, submitted the following resolution. "Resolved, that a committee of seven be appointed by the President, for the purpose of drafting and reporting resolutions expressive of the sense of this convention." Which was unanimously adopted.

Whereupon the President named the following persons to constitute said committee, viz. John Stryker, Elisha Camp, Eli West, James T. Watson, Ziba Knox, Lemuel Hough, and Patrick S. Stewart.

The Convention was then addressed by the Hon. M. Sterling and others.

The committee appointed to draft resolutions reported the following, which were unanimously adopted.

Resolved, That the great State of New-York which took the lead in the march of Internal Improvement, and in developing sources of prosperity to her citizens by the construction of Canals, ought not yet to stop in her course, and suffer other States to go before her. Because she is able from her productive resources to extend the benefits of Internal Improvements, which have already elevated the character of the State, and enriched a great portion of her citizens. Because she would do injustice to a section of the State whose natural advantages for constructing a Canal and whose productions are at least equal to those sections on which the bounties of the State have been freely bestowed. Because the great production and commerce of iron, lumber, and other cumbersome articles, require greater facilities of market. Because the productions of a portion of our State which now are compelled to seek a doubtful market in a foreign country, should be able by Canal navigation to reach the City of New-York, destined by nature to be the emporium of the United States. Because laudable enterprise would be stimulated, individual and national wealth increased, and

the dignity and character of the State receive additional lustre.

Resolved, That the system of Internal Improvements as heretofore acted upon, in drawing upon the common funds of the State for defraying the expense of the construction of Canals, is virtually a *pledge* of the faith of the State to extend equal benefit to every part, and to compensate each section with the means of prosperity which they have patriotically and cheerfully contributed to procure for others.

Resolved, That the construction of the Black River Canal ought to be among the first improvements, as this district undoubtedly suffers most for want of facilities for transportation; the great resources of the country, producing cambrous staples, must remain closed and unproductive without a Canal.

Resolved, That while we have seen with feelings of pride and satisfaction our fellow citizens of the East, West, and South, accommodated with Canals—and that while we assented to, and assisted in the enacting of laws for promoting the interest of other sections of our State to the injury of those who live in the valley of the Black River, we acted on the patriotic principle that private interest should be yielded to public good; that we are satisfied that the same principle now operates in our favor, and that right and equal justice demand a reciprocal sense of liberality and patriotic course of conduct from those who are now enjoying unexampled prosperity by accommodations constructed with our full share of expense.

Resolved, That though we have been repeatedly disappointed in our application for a law providing for the construction of said Canal, still the justice of our claim, the undoubted practicability of the project, and the great advantages to be derived from it, not only to this, but to other parts of the State, inspire us with confidence that the fostering hand of the State will no longer be withheld.

Resolved, That the immense quantities of valuable timber with which the valley of the Black River abounds, the inexhaustible beds of iron ore, the great fertility of the soil, the industrious and enterprising habits of the population, and the increased resources of revenue which will be developed, furnish a sure guaranty to the State, that the expense of its construction would be soon reimbursed.

Resolved, That a committee of five be appointed by the President to prepare an address to the people of the State—

Whereupon the following persons were appointed:

Ela Collins, of Lewis co.  
P. S. Stewart, of Jefferson co.  
J. H. Bronson, of Watertown,  
Elisha Camp, of Sackets Harbor,  
J. Hathaway, of Oneida co.

On motion, Resolved, That the proceedings of this convention be signed by the officers and published.

STYLVESTER MILLER, Pres't.  
MICAH STERLING,

HARVEY BRATTON, } Secretaries.

NEW-ORLEANS AND NASHVILLE RAILROAD.  
—We find in the "Alabamian" the following article in relation to this Road, and we give it in anticipation of the Chief Engineer, Mr. Ranney's, Report, which we have been

looking for for several days, but which, owing probably to the absence of the Directors, has not yet been published.

NEW-ORLEANS AND NASHVILLE RAILROAD.  
—We take great pleasure in laying the subjoined letter before our readers, with which we have been politely furnished by Mr. Breedlove, of New-Orleans—now on a visit to this city—the gentleman to whom it was addressed.—It needs no comment, as the facts which it develops are well calculated to satisfy every candid mind of the entire practicability of this truly great and noble work of internal improvement.

New-Orleans, Aug. 29, 1835.

Dear Sir:—Our Engineer, Ranney, has submitted to me, as acting President, his Report; but from the absence of some members and sickness of others present, no quorum can be formed now; consequently, no action can be had on it by the Board, otherwise it would have been printed and a copy furnished.

The total distance from here to Nashville, is 565 miles—and this, together with upwards of 500 miles lateral roads, have been surveyed in the short space of about six months, and at an expense of 25,000 dollars—all contributed by individuals, and generally under the belief that it would not be refunded.

Total height to be overcome,	2649 ft.
Average descending grade towards Orleans.	4 2-3
per mile,	4
Do. ascending do.	4
Length of straight line,	308 miles
Do. curve over 10,000 feet radius,	113
Do. under 10,000 and over 5,000 feet radius,	114
	554

His estimation of cost for construction of these 565 miles, ready for cars,	\$8,681,945
To which add cost of machinery, including engines, cars, &c.	882,000
Being 40 locomotives,	288,000
860 1st class cars,	252,000
1000 2d do do	200,000
1000 3d do do	150,000
Real Estate, Deposits, Water Stations, &c.	500,000
	10,063, 946

The average construction per mile, will be \$15,165; that for a single track, but graded for a double one—when, in the course of time, it should be necessary to add another, its expense will be about \$6,500 per mile.

The breadth of Railroads generally, in this, as well as in other countries, has been fixed at 4 feet 9 inches—but Ranney suggests the propriety of extending this 5 feet 6 inches, and adduces as reasons for this unusual breadth, greater stability of machinery, less liability to accident, more compact and powerful engines, and commodious cars; also, the advantage of using wheels of greater diameter by which the machine of the locomotive may be worked at a slower rate, and the same velocity maintained; the cost being the same. The Rails weigh about 55 pounds the lineal yard, and cost, with necessary fastenings, about \$400 per mile; 50 miles already contracted for, deliverable in February.

But conceive if you can, of these locomotives, all puffing and snorting, bearing in their train 2366 cars laden with 10,000 passengers; 40,000 bales cotton; hhds. tobacco, and other unnumbered arti-

cles, moving along at the rate of only twenty miles an hour!!

Is this fiction, is it romance, is it the revelry of an excited imagination? No; it is the all powerful eye of faith, turning aside the impenetrable veil that's suspended at the vestibule of futurity, enabling its possessor merely to look but a short distance down that dark vista, beyond the horizon that bounds the present, and then he finds all this, nay more, fully personified by actual fact.

As the Engineer proposes an unusual BREADTH from that generally adopted, criticism upon it, is most earnestly solicited, by every one competent to shed any light on it—and if your acquaintance authorizes, you may profitably use it for the Company, by having it noticed through the medium of the press.

Respectfully,

JOSHUA BALDWIN.

AT a numerous meeting of the inhabitants of, and persons interested in Real Estate in Williamsburgh, Bushwick, Newtown, Flushing, and North Hempstead, convened in pursuance to public notice at the house of William Ward, in Williamsburgh, on Friday, the 16th October, 1835.

The notice for the meeting having been read, the meeting was organized by choosing the following officers:

GENL. JEREMIAH JOHNSON, President.  
COL. GEO. WILLIAMS, of Newtown, } Vice  
SILAS BUTLER, Esq., of Brooklyn, } presidents.  
CHARLES DE FOREST, of New York, } Secre's.  
ISAAC W. BOWNE, of Flushing, }

The object of the meeting having been stated, it was on motion of Edward Sanford, Esq.,

Resolved, That a Committee of seven be appointed by the President, to retire and draft a memorial to the Board of Directors of the Long Island Rail Road Company, on the subject of the location of the main route of that road, and also to report resolutions expressive of the sense of this meeting, whereupon the following gentlemen were appointed on that committee:

William R. Prince, of Flushing; George J. Rapelye, of Newtown; John Morrell, of Williamsburgh; Edward Sanford, of New York; William P. Hallett, of New York; P. J. Fish, of Williamsburgh; John Noonan, of Flushing.

The committee after retiring, reported by William P. Hallett, Esq., the following memorial and resolutions, which were unanimously adopted, viz:

#### MEMORIAL.

To the Honorable the Board of Directors of the Long Island Rail Road Company.

The memorial of the undersigned inhabitants of, and persons interested in real estate in the village of Williamsburgh, and in the towns of Bushwick, Newtown, Flushing, and North Hempstead, respectfully shows,

That they are informed that surveys and estimates are now in progress under your direction for the purposes of enabling you to decide upon and select the most eligible and advantageous route for the location of the Long Island Rail Road. That the undersigned, in common with their fellow citizens of other towns on the Island, feel a deep interest in the promotion of the work, and in extending and diffusing the great benefits to flow from so important an improvement, to the greatest number of individuals and the most enlarged practicable territory. That the Brooklyn and Jamaica Rail Road Company having declined to become subscribers to the capital stock of your Corporation, and unite their road with the one to be constructed by you pursuant to the act of incorporation, you are under the necessity of constructing your road from Jamaica to the water's edge at Williamsburgh and Brooklyn, without reference to the road constructed by that company, being thus left at liberty under the provisions of your charter to select such route as will combine the greatest number of advantages to your company, the travelling public and the mass of community, the undersigned would respectfully press upon your attention the great saving in distance which can be effected by locating the route of your rail road from the village of Williamsburgh, through the towns of Bushwick, Newtown, Flushing and North Hempstead. From the cursory examination of the engineers

employed by the commissioners which have been given to the public, it appears that the eastern and western subdivisions of the road by whatever route, are on ground of the most favorable character, and free from any difficulty or obstruction whatever. The route we advocate is concededly the shortest, and on a favorable surface of ground, and to these high considerations it would seem to be sufficient to add the additional facts, that it moves through the most populous and improved section of the island, and carries its benefits to the central part of the city of New-York. The combined interests of the inhabitants of the city, and of Long Island, of the travelling public and the cultivators of the soil, whose produce is to be carried to market, of the land holders, and (as we sincerely believe) of the stockholders in the Rail Road Company, unite in calling for the adoption of this route. The opinion of the engineer, on whose judgment we are aware you will thoroughly rely is understood to be favorable to this proposed course, and when it shall be fully expressed, and the character of the work, the saving of distance and expense in the daily travel of the route, the comparative populousness and fertility of the soil, the rapidly increasing population and extension of the city of New York, shall be attentively considered by your honorable body, with a view to deciding this important question, the undersigned entertain the confident hope that you will be fully satisfied of the policy, economy and public advantage of extending the greatest benefits to the greatest number, and adopt the route. We here unite in recommending Williamsburgh.

Oct. 16th 1835.

RESOLUTIONS.

Resolved, That as citizens, we feel a lively interest in the promotion of the construction of the Long Island Rail Road. That we regard it as an extension of that liberal and enlightened policy in relation to internal improvement which has elevated the State of New York to its present standing in the confederacy, and made it first in commerce, wealth, enterprise, and population.

Resolved, That we regard the location of the route of the Long Island Rail-road as highly important in its bearings to the stock holders, and the community at large. That the selection of a direct and eligible route from such point as will afford the greatest convenience and benefit to the greatest mass of the people, without prejudice to the interests of the stockholders, and render it useful in developing the resources of Long Island and the city of New-York, is a duty which the Board of Directors owe to their fellow-citizens.

Resolved, That in the opinion of this meeting the permanency of the work is a highly important consideration in determining the question of location. That the rapid growth of the city of New-York, the present tendency to break the narrow bounds which have restricted its principal business within narrow limits, and the disposition to extend the commercial business towards the more central parts of that city support the claims of the middle section, to have the Rail-road located from some point in Williamsburgh, through the towns of Bushwick, Newtown, Flushing, and North Hempstead.

Resolved, That in the view of this meeting the addition of the two proposed new Ferries to the Village of Williamsburgh, will afford the requisite facilities to the travelling public to reach the Rail-road and the various parts of the city, while the proposed location of the Rail-road and the Ferries will extend to the people of Long Island the means of carrying their products to the most favorable market and diffuse the benefits of a great public improvement equally among the people.

Resolved, That a Committee of twenty-five be appointed by the President for the purpose of promoting the general objects of this meeting, whereupon,

The following Committee was appointed—

Hon. Nathan Sanford, of Flushing,	
William R. Prince,	do
Joseph Bloodgood,	do
Richard L. Franklin,	do
Robert Carter,	do
Jordan Wright,	do
Benjamin W. Strong,	do
Platt Stratton,	do
George J. Rapelye, of Newtown,	
Nicholas Wyckoff,	do
Abraham Ransom,	do
Peter Gorsline,	do

Effingham Lawrence, Bayside,	
Joseph L. Franklin,	do
John Morrell, of Williamsburgh,	
Edmund Frost,	do
Lemuel Richardson,	do
Abraham Boorem, of Bushwick,	
George Douglass, of Little Neck,	
Peter V. Remsen, of Brooklyn.	
George Duryee, of North Hempstead	
William P. Hallett, of New-York	
Edward Sandford	do
John Sutphen	do
Gilbert C. Rice	do

On motion it was

Resolved, That the officers of this meeting be added to the above committee.

Resolved, That a Committee of five be appointed by the President to confer with proprietors of the land on the proposed route, who may be desirous of gratuitously ceding their land to the Rail Road Company, whereupon

The following gentlemen were appointed said committee:

John Noonan	Singleton Mitchell
Lemuel Richardson	Nicholas Wyckoff
George Williams,	

Resolved, That a committee of five be appointed by the President to confer with the Board of Directors of the Long Island Rail Road Company, and present the memorial and resolutions adopted by the meeting, whereupon the following gentlemen were appointed said committee:—

William P. Hallett,	James Connor,
William R. Prince,	Edmund Frost,
Nathan Sanford.	

Resolved, That the proceedings of this meeting be signed by the officers, and published in all the newspapers in New-York and Long Island.

JEREMIAH JOHNSON, President.

GEORGE WILLIAMS, } Vice-Pres.

SILAS BUTLER, }

q19

[From the Baltimore Patriot.]

ANNUAL REPORT—Baltimore and Ohio Railroad Company. The Ninth Annual Report of the President and Directors to the Stockholders of the Baltimore and Ohio Railroad Company has just been made. The views heretofore expressed by the Board of Directors, in regard to the business that would be created by the Railroad along its course, have, we learn, been fully realized. The receipts of the transportation department, which afford unerring evidence both of the value and progressive increase of the trade thereon, will be found particularly satisfactory. These receipts for the present year, exceed those of the last by nearly 58,000 dollars, while the expenses during the same period have only increased, as we understand, about 23,000 dollars—thus showing a net increase of receipts for that department of about 35,000 dollars. The gross revenue of the Company for the year ending on the 1st inst. is stated at \$383,368 10. The expenses during the same period are \$156,904 39—leaving a net revenue of \$107,163 91.

Since the opening of the Washington Railroad, the amount of travel and intercourse between the two cities has greatly increased. The average at this time is understood to be about two hundred persons per day. Large numbers who formerly came to Baltimore by the bay route, now ascend the Potomac, and avail themselves of the Railroad. The results already fully justify the policy of taking the greater part of the stock of this road on account of the Company. The distance from city to city is now performed by the locomotive engines in about two hours and ten minutes. The improvements contemplated on a portion of the main stem of the road, will soon bring the time necessary for this journey within the limit originally proposed of two hours.

The machinery and motive power employed by the Company are such as to be quite satisfactory. As a proof of the efficiency to which the locomotive power has now been brought, under its patronage, we may mention that the "Arabian" is now in daily use—travelling 80 miles, without slackening its fires or letting the steam get down. And the "Washington," a new engine on the same plan, lately made an exhibit of its power which was quite decisive. With a load amounting to 113 tons, this engine travelled to the City of Washington, at a rate not less of any place than ten miles an hour—the average speed was much greater.

And on the level parts of the road, the rate of speed seemed entirely at the discretion of the engineer.

The reconnoissances between Cumberland and the Western waters, have established the important fact that the mountains to be traversed by the road can be passed by locomotive engines and their trains, without the use of stationary power.—The routes to Pittsburgh and Wheeling are both shown to be perfectly practicable, and all the interests involved in the extension of this great work, seem to require that both roads should be made.

Troy, our own Troy we mean, is one of the most spirited and enterprising towns in this, or any other State, going, in that particular, far ahead of its slow and cautious neighbors, of Albany.

Among other indications of this fact, is a statement we find in the Albany Daily Advertiser, of yesterday, that "the proprietors of the Troy and Ballston Railroad, have purchased the principal portion of the stock of the Schenectady and Saratoga Company, and most probably they will transfer the whole of the passenger travel to the Springs from the latter to the former road."

THE LONDON AND BIRMINGHAM RAILWAY shares, on which 50l. has been paid, are now selling for 60l.

NEW METALLIC CEMENT.—A new metallic cement, for which a patent has been taken out, consists of powdered scoria from the copper works, mixed with stone and lime. It sets rapidly, and takes a fine metallic polish. It is now being used by Messrs. Harrison, in a large building intended for an inn, at the south-west corner of London Bridge. This cement, unlike all other kinds except Frost's, is sold mixed up ready for use. The price is 9d. per bushel. If the scoria, in a state of powder, were sold by itself compressed in casks, it appears to us that it would form a very desirable cement for exportation. It may be laid on in coats as thin as the fourth of an inch, but it has not been a sufficiently long time in use to determine to what extent it will crack.—[Lon. Mec. Mag.]

DURABLE WHITEWASH.—I am enabled to certify the efficacy of marine salt in fixing whitewash made of lime. In the year 1795, when I was director of the naval artillery at the port of Toulon, I was commissioned to ascertain the utility of a method proposed by the master painter of that port, M. Maquilian, for whitewashing the ships between deck, and likewise their holds, in a durable manner, by means of lime. Our report was in favor of this process, which consists in saturating water in which the lime is slacked with muriate of soda, (common salt.) The whitewash produced by it is very permanent, does not crack, nor come off upon one's hands or clothes. The experiment was made only on wood. It appears from M. St. Bernarde's account, that it succeeded equally well on walls.—[Annales des Arts et Manufactures.]

The length of the paved streets in England and Wales is 30,000 miles; that of the roads which are not paved is 100,000 miles. The extent of the turnpike roads is about 30,000 miles.

NEW STEAM-ENGINE.—It is said the Rev. W. Morris, minister of Deanrow chapel, Wilmslow, in Cheshire, has invented a new steam-engine, expense of erecting which will be less than a tenth part of the cost of a steam-engine of equal power, and the expense of working it will be less than one-thousandth part of the expense of working a steam-engine of equal power.

The following communication is only a commencement of what we hope to be able to give in relation to the "Novelty Works" of this city. There are improvements going on there which will, when completed, astonish those who are not familiar with the operations of the distinguished gentleman spoken of in the following communication. We are not sufficiently acquainted with the works yet to speak of them in the manner they deserve, but shall, when permitted, give a full description of the works, and the improvements introduced for melting iron.

[For the Railroad Journal.]

#### **Mechanical Improvements—Novelty Works.**

MR. MINOR: Sir,—In visiting and inspecting the various mechanical improvements in this country, which have come into existence within forty or fifty years, and in learning the history, characters, and doings, of their several introducers, projectors and inventors, one is naturally at a loss which most to admire, the various inventions and improvements, or the talents and ingenuity of their authors.

In connection with the subject of mechanical improvements, I had often heard mention made of Dr. Nott. I had seen several kinds of stoves, both for heating houses and for culinary purposes, said to be invented by him, which I thought displayed ingenuity; and I had seen a steamboat, of somewhat novel construction, which also bore his name, both as inventor and proprietor. But having never yet, to my knowledge, been favored with a sight of that gentleman, and having, through the medium of common report, previously to any knowledge of his mechanical reputation, formed an idea of him as a gentleman of uncommon scientific and literary acquirements—a minister of the gospel of the most distinguished rank—and president of a very respectable collegiate institution; I could not but imagine that though he had by some lucky thought hit upon some improvements in the construction of stoves, and, perhaps, might have some vague, abstract notions respecting the nature and management of steam, in propelling boats, yet his knowledge must be altogether superficial.

But, being in New-York a few days since, and hearing of a large establishment, called the *Novelty Works*, said to be owned by Dr. Nott and others, I procured from a friend a note of introduction to a gentleman who was one of the partners, and visited the place, when, on presenting the note, I was not only permitted to examine every thing in and about the concern, but the gentleman, with the kindest attention and the utmost politeness, accompanied me through every part, and explained every thing which needed explanation.

This examination left no trace of the impression I had received about the doctor's superficial knowledge. I found an immense establishment, in which were carried on all the different branches and operations, in any way connected with making stoves, steam engines, boilers, and almost every other article of large machinery, and even steamboats; the whole divided into its proper departments, and each department furnished with the most ingenious and perfect apparatus I had ever seen. A spacious yard, which con-

tains the establishment, is enclosed to keep out idle intruders, and each department has a shop by itself. I saw in each department more or less improvements from the common modes of doing the same business, among the most important of which were a steam-boiler and a mode of facilitating the melting of iron, making a saving of heat and time; each of which, and several others, were well worthy of distinct notice. I could not but gaze with wonder on this establishment, with all its system and improvements, that the whole should be planned and directed by the head of one person, who, at the same time, was actively engaged in other avocations of a nature so widely different.

"And still I gazed, and still the wonder grew,  
That one small head should carry all he knew."

There was a kind of charm that still heightened the pleasure of this interesting visit, from the recollection that I had often in former days rambled over the ground when it was in open fields, an hour's walk from any part of the city, and hardly, by a common cultivation, reclaimed from the state of nature. The spreading population of the once distant city, with all the din of business, has now reached the establishment; and it seems placed as a corner stone, or as a guide and pattern to the city, to lead them on in the road to perfection.

I quitted this place with reluctance; but if life and health permit, I shall visit it again, and shall notice the several improvements more in detail.

ARCHIMEDES.

We would ask for the following communication an attentive perusal, especially by the mechanics of this State, and others who are opposed to the present system of State prison labor. They will not, we are sure, willingly stand by and see the introduction of the silk manufacture, if, by concert of action, and a continued opposition, they can prevent it.

[For the Railroad Journal.]

#### **Progress of Civilization and the Arts.**

It appears, not only from the history of our times, but of all past ages, that the progress from the savage state to that of high improvements in civilization, with its millions of useful arts, is not by gradual advances, but by sudden starts, the effect of some accidental exciting cause; and that whatever may be the state of any portion of mankind, if no such exciting circumstance happens to take place, they will remain in that state, without any advance toward improvement for ages, and perhaps forever. We see portions of the human family which have probably always remained in as unimproved a state as human nature can exist in, and show no signs of ever being otherwise; and we also see other portions which, from time immemorial, have remained with very little improvement, at once awaking, as if from sleep, and in a few years making advances which seem to outstrip the imagination and bid defiance to impossibilities.

Fifty years ago, the various mechanic arts, and the branches of science on which they are founded, were but very little better known in this country than they were to the aboriginal inhabitants five hundred years before. It is true, we had a few men who could make and repair horse shoes and plough-shares in a clumsy manner, but machinery and the fine arts, and even the finer branches of the common arts, were wholly unknown; or, at least, unknown in prac-

tice. Even in England, where they are now probably as far advanced as in any part of the world, two or three hundred years since they had made no progress; and throughout Europe the case was nearly the same.

But the art of printing had kindled a flame which was to light the world to an immense field of discoveries, without which it would have remained forever inconceivable. This light had begun to spread and to show the outlines of useful knowledge, when the art of spinning cotton by machinery and of propelling that machinery by steam were discovered in England. These together gave an impulse to the spirit of invention, producing effects which no human foresight could have anticipated, and which no one was so credulous as to believe, if it had been foretold.

It is now forty-eight years since the first attempt, and forty-two years since the first successful one, to introduce cotton machinery into this country, and the introduction of steam power has since followed. Before that time many branches of business, which are now too common to excite notice, would have been subjects of extreme wonder; and many things we now see done every day would then have subjected the person who did them to the charge of witchcraft.

These two inventions, that of spinning by machinery and that of propelling that and other machinery by steam, may be set down as the pioneers which have introduced into this country almost every valuable improvement in the arts which we now possess; they have effected a greater change than ever took place before in any country in four times as long a period. It can be truly said, that in the above short space of time we have progressed from a state of comparative ignorance in the arts to an equal rank with any other nation. We have almost every useful art, carried on in a flourishing condition; and have made and are daily making in many of them valuable improvements. There are now but two important branches which we have not already fairly introduced and carried to a respectable degree of perfection. These are pottery and silk; and these are now in the act of being introduced under circumstances which guarantee their arrival, in a short time, to the highest degree of perfection. We possess all the materials in abundance to perfect the first, and fair specimens are already produced. For the second we have advantages decidedly superior to those of any other nation. It has been demonstrated by those whose knowledge and veracity can neither be questioned nor doubted, that the American silk is superior to that of any other nation; and a thousand facts show that the mulberry, which is the peculiar food of the silkworms, if not indigenous in our soil, thrives in it better than most other trees. The establishment of these two branches will soon make the second great and perfecting era in the history of the arts in this country. The various ornamental branches, as drawing and painting, and other minor parts of the business of manufacturing pottery and silk, will be necessarily improved and extended, and the whole compass of arts will exhibit the effects of new and powerful stimulus.

And it must, therefore, be a subject of regret to every person of patriotic feelings, who understands the subject, that the legislature of this State has, at its last session, passed an act to introduce the manufacture of silk into our state prisons, which, though it proceeded, no doubt, from the purest motives, will, if it has any effect, produce injury rather than benefit.

The business of manufacturing silk is destined, in a short time, to become a principal source of our national wealth; and

what is of infinite importance, it seems to be designed by the discriminating eye of infinite wisdom to be almost exclusively the business and employment of females. The first discovery of its use was made by an empress—the labor is more appropriate for women and children than for men, and the fabrics when completed are more particularly designed for their use than for males. Women are, in general, more industrious than men; and are willing to apply themselves more steadily to business, if they can receive adequate compensation. But the use of machinery has relieved the hands of the female community from a great part of the labor which was formerly necessary in clothing themselves and their households. They have not, however, lost their habits of industry, but would cheerfully and proudly pursue and conduct any honorable business which would be productive of profit, and their general habits of economy as well as industry would be a sure guarantee of their success. Thus, while our wives, daughters, and sisters, were helping on the road, not only to competency, but to wealth, without lessening or encroaching on our own proper field of profitable labor, their business would open an increased and extensive demand for such labor in machinery and fixtures. Instead of being taxed to support them for the sake of those charms we so much adore, and which are necessary to our very existence, they will more than compare notes with us in profit, while their charms will not only be increased by wholesome exercise and the expression of self-approbation, but still heightened by more rich and elegant clothing, wrought by their own delicate fingers.

From all these considerations the silk business ought to be hallowed, and sacredly appropriated to the department of female management. No man ought to engage in it any farther than as an assistant, to furnish the necessary fixtures, and to aid in cultivating the trees, and also to prepare the machinery necessary in manufacturing it. At the heads of this noble department our females will feel new importance in scale of being, while they are not only clothing and adorning their persons with the richest fabrics of their own making, but adding immense sums to the national wealth. Under these circumstances, will they not feel their rights invaded and encroached on—their prospects and profits interfered with? and what is still worse, will they not feel themselves insulted and degraded by the proposed competition with them in the state prisons, and by making them fellow laborers with base wretches whose crimes have deprived them of liberty, and shut them from the sight of mankind? If they do not feel all this, and feel it with the spirit of strong resentment, they are not the beings we think them.

But besides all this, there is no other branch of business in the whole compass of the useful arts so completely unfit for the employment of convicts in a state of confinement—so sure to defeat the object the legislature had in view, (which was doubtless to make the convicts earn their living without interfering with the rights of free citizens,) as the culture and manufacture of silk. The business of planting and cultivating the mulberry trees we should certainly think inconsistent with the state of confinement in which they must necessarily be kept. The feeding and taking care of the worms is much more appropriately the business of women and children than of men, even if the prices of the labor were the same. The reeling the silk has ever been, and must always be, the business of females;

the rough and large fingers of men are unfit for it. All that remains, then, is the weaving and dyeing. The weaving by the power loom is already commenced by Mr. Gay, at Providence, with the most perfect success, and all plain silk fabrics will soon be woven by it; and every man acquainted with cotton manufacturing, knows that women are better attendants on the power loom than men, independently of the difference in prices of labor. For weaving figured and other fancy articles much skill is necessary, which can only be acquired by a thorough education in the intricate branches of weaving, and will require complicate and expensive machinery. The dyeing might, perhaps, be done at the state prisons to advantage, where the goods are manufactured in the neighborhood; at any considerable distance the profits would not pay for transportation.

This is no exaggerated statement—no distorted picture of the case. It will be found on trial to be the plain truth in every particular. Who then will advocate the introduction of silk manufacturing in the state prisons? We think no one who possesses a knowledge of the facts, and who is in his sober senses. S. B.

[For the Railroad Journal.]

To set out the Holes in the Circles of the Index to a Machine for Cutting the Teeth in Gear Wheels.

Rule. Take several convenient numbers for a circle that is most used, and find the least common multiple of them, by the rule laid down in Pike's Arithmetic, page 69.

Example 1. We will select for the first circle the numbers 12, 16, 20, and 24.

$$\begin{array}{r} 4)12 \quad 16 \quad 20 \quad 24 \\ 3)3 \quad 4 \quad 5 \quad 6 \\ 2)1 \quad 4 \quad 5 \quad 2 \\ 1 \quad 2 \quad 5 \quad 1 = 240 \end{array}$$

Example 2. We will next select for the second circle 10, 15, 21, 25, and 30.

$$\begin{array}{r} 5)10 \quad 15 \quad 21 \quad 25 \quad 30 \\ 3)2 \quad 3 \quad 21 \quad 5 \quad 6 \\ 2)2 \quad 1 \quad 7 \quad 5 \quad 2 \\ 1 \quad 1 \quad 7 \quad 5 \quad 1 = 1050 \end{array}$$

2d circle.

Example 3. For third circle, 40, 60, 80, and 100.

$$\begin{array}{r} 10)40 \quad 60 \quad 80 \quad 100 \\ 4)4 \quad 6 \quad 8 \quad 10 \\ 2)1 \quad 6 \quad 2 \quad 10 \\ 1 \quad 3 \quad 1 \quad 5 = 1200 \end{array}$$

for 3d circle, &c.

By the above rule, I have calculated the holes for several circles, which are as follows: 1st, A circle of 240 holes will cut 120, 80, 60, 48, 40, 30, 24, 20, 15, and 12 teeth. 2d, A circle of 144 holes will cut 144, 72, 48, 36, 24, 18, 16, and 12 teeth. 3d, A circle of 200 holes will cut 200, 100, 50, 40, 25, and 20 teeth. 4th, A circle of 72 holes will cut 72, 36, 24, 18, 12, 9, 8, and 6 teeth. 5th, A circle of 132 holes will cut 132, 66, 44, 33, 22, and 11 teeth.

Which is the most that is in common use. S. A.

[From the London Mechanics' Magazine.]

PORTLAND BREAKWATER.—Sir,—I regret that my official duties have prevented my paying earlier attention to Mr. Lamb's communication, dated 4th March, No. 605; not that I think it a matter of any consequence, as affecting my late father's claim to priority of design for the

Portland Breakwater, but lest my silence should be construed as a tacit admission of Mr. Lamb's claims. I take it for granted, that if any communication on a breakwater for Portland roads shall appear to have been made by my father previous to June, 1812, (the earliest period to which Mr. Lamb can carry back his suggestion,) then the originality will rest with my father. Now Mr. Ham, with whom I have had no intercourse, directly or indirectly, for more than twenty years, until within the last fortnight, having seen the correspondence in the Mechanics' Magazine, unsolicitedly wrote a letter, (published in Mech. Mag. p. 269, vol. xxii.) in which he says, "I can add my testimony, that in the year 1800 I frequently heard him (meaning my father) speak of his plan, and give minute details of the same;" and in a subsequent letter which I have received from him, dated 24th May, 1835, he adds—"I can still recollect that he (meaning my father) appeared quite *au fait* in all the details, and delighted to explain them to the nobility and gentry, who so frequently visited his library, when George III. drew such a concourse of them to Weymouth. This allusion, you will perceive, will carry the date of your father's plan even prior to the year 1800. I soon after left Weymouth."

I can mention many other persons who were well acquainted with my father's designs, and to whom he made occasional written as well as verbal communications, in reference to the subject anterior to 1812. A communication was made to Lord A. Beauchamp, in June, 1810. Gen. Donmourier, an engineer of no common order, had also frequent interviews and conversations with my father on this subject, as being intimately connected with the improvements of our maritime competitors at Cherbourg, then in progress; from him my father received many important hints in furtherance of his own ideas. A communication was made to Lord Sidmouth in September, 1810, on the same subject. I have numerous letters to my father from gentlemen who were in the habit of frequenting Weymouth at the time of the visit of his late Majesty, George III., in which reference is constantly made to him as the person who had first suggested the idea of a breakwater at Portland. My father communicated his design to Mr. Idle, confidentially, in June, 1812, when that gentleman was a candidate to represent Weymouth. At that period the subject was generally discussed, and no doubt, from the publicity given to it, Mr. Lamb's intentions originated, as his professional connexion with Mr. Idle afforded him the opportunity of being well acquainted with every transaction, private as well as public, in which Mr. Idle had any share. The slight intercourse which then took place between my father and Mr. Lamb, was not of such a description as to require or induce him to make a confidential communication. The question of originality was never mooted, because there could be no doubt upon the subject. In all my father's extensive correspondence with

men of rank and influence, there is but one opinion expressed, namely, that the design first emanated from him. As to my father's silence, on which Mr. Lamb seems to lay so much stress, that merely shows that he was cautious of committing himself to strangers, and that he had not taken any steps to carry his design into execution, because he did not possess pecuniary means sufficient to justify his embarking in so extensive an enterprise. If Mr. Bracebridge had not known that my father had possessed plans and particulars before August, 1813, what could have induced him to apply for them? He says, under date August 13th, 1813, "Though dismissed, perhaps, for want of encouragement, from your present intention (pending a more favorable period for such an enterprise,) I am confident a mind capable of forming such a design, could never willingly abandon it. As I understand you had in your possession, plans, soundings, and various requisite materials for this great work, upon which such has been my reflection and contemplation, and consequent admiration of the plan, that I have ventured to mention it to some confidential, scientific, and, otherwise, able friends," &c. &c. Again—"These, sir, were the feelings which led me to wish it may be in my power to render you any service in this matter, and induce you to turn your mind again to a plan on which you have already bestowed so much trouble and attention." Can this be any thing but conclusive? Is there any symptom of a competitor for the credit of origination? Must it not have been known to Mr. Bracebridge, if Mr. Lamb had hinted any intention of claiming the projection of a breakwater at Portland, and would Mr. Bracebridge have thus written with such a knowledge? Mr. Lamb does not put forth his claim until the year 1834, when Mr. John Harvey, the original projector of this design, is dead. If Mr. Lamb had any pretence to originality in this matter, how happens it that even Mr. Idle, so late as 1813, wrote a letter to my father on the subject, addressing him as being not merely a principal, but the only projector of the undertaking? Indeed that gentleman, as well as Mr. Bracebridge, always considered my father as the individual with whom the design for a breakwater at Portland had originated. And so did, I may truly say, the entire population of Weymouth and its neighborhood, since no farther back than July last, 687 of the principal inhabitants signed a petition to his present Majesty in favor of a breakwater based on my father's plan, in which he was distinctly recognised as the father of the projected undertaking.

I am, Sir, your very ob't serv't,

JOHN HARVEY.

Weymouth, June 6th, 1834.

*Extracts from a Lecture on the Preservation of Timber by Kyan's Patent for preventing Dry Rot: delivered by Dr. BIRKBECK, at the Society of Arts, Adelphi, December 9, 1834.*

We have heard persons assert that it

appears to them almost ridiculous to suppose that it ever can become necessary, on a large scale, to perform any operation with a view to render timber durable, beyond that of properly seasoning it by exposure to the atmosphere. But is not this mere prejudice? Why should not timber be prepared by a particular process, which conveys something additional into it, and thereby effects a chemical change in its nature, as well as leather is tanned?

"A very effectual procedure has taken place, in regard to one form of animal matter, by the preservation of the skin from natural decay in a process known by the name of 'Tanning.' This process will give a very good idea of Mr. Kyan's invention. Tanning consists in protecting the leather and skin by the introduction of tannin, which is generally derived from an infusion or decoction of the bark of the oak. If no change were produced in the gelatine, which makes the largest part of the skin to be immersed in the tan pit, it would undergo certain chemical changes—it would putrify, and lose its tenacity; but if a portion of animal jelly is dissolved in water, and a little of the substance added, similar to the tannin, a combination will take place between the gelatine; a precipitate will follow of the animal matter, which is the tanno-gelatin, or a compound of tannin and gelatine, and is precisely that substance which is formed in the leather, and gives to it durability and power to resist the causes of decay. The same intention exists in the process of Mr. Kyan. It is true he does not act on the gelatine of animal matter, but he does on the albumen: one of the approximate principles of vegetable matter, which appears to have been slightly perceived by Fourcroy, but which was actually discovered by Berzelius, about the year 1813.

"In order to obtain this vegetable matter (*albumen*), there are various substances which may be employed. The *Hibiscus esculentus* yields it in considerable abundance: it is a West Indian plant, which Dr. Clarke mentions as adopted in Demerara, for the same purpose, as, in other Islands, the white of eggs and blood are employed in the process of clarifying sugar. The *figus indica*, also, if divided at the stem, will exude a considerable quantity of this matter. If the solution of the bichloride of mercury (which is the agent adopted by Mr. Kyan) is added to the vegetable matter, albumen, it will be found, when they come in contact, that decomposition occurs."

"Mr. Kyan, who had been a series of years (since 1812) engaged in trying a variety of experiments on the preservation of timber, was led to the present experiment by having, as he conceived, at length ascertained that *albumen* was the primary cause of putrefactive fermentation, and subsequently of the decomposition of vegetable matter. Aware of the established affinity of corrosive sublimate for this material, he applied that substance to solutions of vegetable matter, both acetous and saccharine, on which he was then operating, and in which albumen

was a constituent, with a view to preserve them in a quiescent and incorruptible state, and obtaining a confirmation of his opinions by the fact that, during a period of three years, the acetous solution openly exposed to atmospheric air had not become putrid, nor had the saccharine decoction yielded to the vineous or acetous stages of fermentation, but were in a high state of preservation; he concluded that corrosive sublimate, by combination with albumen, was a protection against the natural changes of vegetable matter."

"The mode in which the application of the solution takes place, is in a tank similar to the model on the table. They are constructed of different dimensions, from 20 to 80 feet in length, 6 to 10 in breadth, and 3 to 8 in depth. The timber to be prepared is placed in the tank, and secured by a cross beam to prevent its rising to the surface. The wood being thus secured, the solution is then admitted from the cistern above, and for a time all remains perfectly still. In the course of 10 or 12 hours the water is thrown into great agitation by the effervescence, occasioned by the expulsion of the air fixed in the wood, by the force with which the fluid is drawn in by chemical affinity, and by the escape of that portion of the chlorine or muriatic acid gas which is disengaged during the process. In the course of 12 hours this commotion ceases, and in the space of 7 to 14 days (varying according to the diameter of the wood) the change is complete, so that as the corrosive sublimate is not an expensive article, the albumen may be converted into an indecomposable substance at a very moderate rate."

After stating the result of various experiments, Dr. Birkbeck concludes by observing that this discovery is yet in embryo, but that the public benefit that will result from it is beyond calculation. In an *Appendix* the various purposes to which the process is applicable are detailed: such as preventing dry rot, seasoning timber, protecting from insects, applying the process to Canada and British timber, and preserving canvass, cordage, &c. from mildew.

"Canada timber is much more liable to decay than that grown in the northern parts of Europe, and for this reason is never used in buildings of a superior description. The principle of decay being destroyed, as above shown, this objection is no longer in existence; and this kind of timber may now be employed with as great security as that of a superior quality and higher price.

"The same observation applies with great force to timber of British growth, particularly to that of Scotland, much of which is at present considered of very little, if any value for durable purposes, on account of its extreme liability to decay, whether in exposed situations or otherwise. The present process will, therefore, render of considerable value, plantations of larch, firs of all kinds, birch, beech, elm, ash, poplar, &c., which are the chief products of the great wooded estates, and which, when prepared, may be

advantageously employed to most useful purposes."

*"Purposes for which the Prepared Timber, &c., would be highly useful.—*Houses, farm houses, out houses. Large timbers, floors, roofs, gutters, &c., furniture, and all joiner's work, preserved from dry rot, and perfectly seasoned. Posts, rails, gates, park paling, fences, hop poles, felloes, spokes, shafts, &c. &c. For these purposes any kind of timber may now be used, instead of the more expensive kinds. It will also supersede, in many cases, the employment of iron, from its acquired durability and greater economy."

The additional expense of preparing timber for buildings, such as farm houses, out houses, &c. in Mr. Kyan's manner is estimated at the very moderate sum of 20s. per load.—[Arch. Mag.]

*Specification of a Patent for a new and improved mode of constructing a Mill Bush, or Spindle Box, for Flour Mills; and also of making and fixing a Ring and Bale in the Eye of the upper Stone. Granted to WARREN P. WING, of Greenwich, Hempstead county, Massachusetts, February 20, 1835.*

To all whom it may concern, be it known, that I, Warren P. Wing, of Greenwich, in the county of Hampshire, and State of Massachusetts, have invented certain improvements in the manner of fixing the mill bush, or spindle box, and of constructing a ring and bale to be fixed in the eyes of millstones for the grinding of flour, or other articles; and I do hereby declare that the following is a full and exact description thereof.

I make a box, usually of cast-iron, which I adapt in size to the eye of the stone. For the sake of facility of description, I will give the dimensions of one which I have made, and which, after a fair trial, has been found to answer well in practice.

The box has a top, which top fits on to it, like a snuff-box. It is ten inches in diameter, and five inches in depth, the outer rim being three-fourths of an inch in thickness. The bottom and top are both perforated in the centre, so as to allow the mill spindle to pass through them. This box is to contain three bearing pieces, of block tin, or of any proper mixed metal, which are to be simultaneously forced up against the spindle, and which are in contact with it for about three-fourths of its circumference, the remaining fourth being exposed to the cooling influence of the air. These metal bearings are cast into a follower of cast-iron, a birds-eye view of which resembles the letter H, the outer end of which receives the cam, or eccentric, by which the bearings are to be forced up against the spindle. Cells to receive these followers are formed within the box, by six wings, or cheeks, extending from the top to the bottom, the sides of each of the three cells thus formed being parallel to each other, that the followers may slide readily and truly therein; these wings are, of course, cast with the box. The void space between them admit of

the contact of air with the spindle, and one of them is to be used for another purpose, to be presently described.

Between the rim of the box, and the crossbars of each of the followers, the bottom is perforated to allow the passage of round rods of iron, the upper ends of which are formed into cams, or eccentrics, for forcing up the followers, and, for this purpose, extend up through the whole depth of the box. The lower ends of the above named round rods, or spindles, extend down sufficiently below the bed stone to allow of their being acted upon conveniently, as they are all to turn at the same time. The turning them simultaneously may be effected in various ways, but that which I deem the most simple is by attaching each of the spindles to a ring, by means of a jointed crank, so that, when the ring is made to revolve, the followers will all advance at the same time; other modes will occur to any skilful mechanic, and need not, therefore, be specified.

The cover of the box I make somewhat convex; it need not be more than one-fourth of an inch in thickness; besides the perforation in its centre for the spindle, I usually drill, or cast, holes through it, near the inner edge, which I fill with wood, in order to nail the elastic collar thereto.

In order to lubricate, or oil, the spindle, I drill a hole through the bottom of the box, near the periphery, and in one of the angles formed by it, and one of the before named wings, or cheeks, in one of the void spaces. A rod extends down through this hole, in the manner of those attached to the eccentrics, and this carries a leaf within the box, to which a sponge containing oil, or a lump of grease of any suitable kind, may be attached. By turning this rod, the oil, or grease, is brought into contact with the spindle, and lubricates it; and this may be done in a moment, as often as it is found necessary.

My improvement in the bale and ring consists in casting them in one entire piece, in such way that the ring may be let into, and firmly affixed in, the eye of the stone. The bale rises as a semicircle above the ring, or forming such other curve between two opposite points on the diameter of the ring, as shall adapt it to the cock heads of spindles already made. Gains, or notches, are made under the ends of the bale, in the ring, to receive the driver.

What I claim as my invention, is the construction of a spindle box, in which the followers are moved up by eccentrics, or cams, without the necessity of stopping the mill, and operating substantially in the manner described.

I also claim the arrangement for lubricating, as herein described, and likewise the manner of constructing the ring and bale in one piece, as therein set forth; not, however, intending to confine myself to the exact form which I have described, but to vary the same in any manner which I may think proper, whilst the like ends are attached by means substantially the same.

WARREN P. WING.

[From the London Repertory of Patent Inventions, &c.]  
*Specification of the Patent granted to JOHN ASTON, for an Improvement in the Manufacture or Construction of Buttons.—Sealed July 10, 1834.*

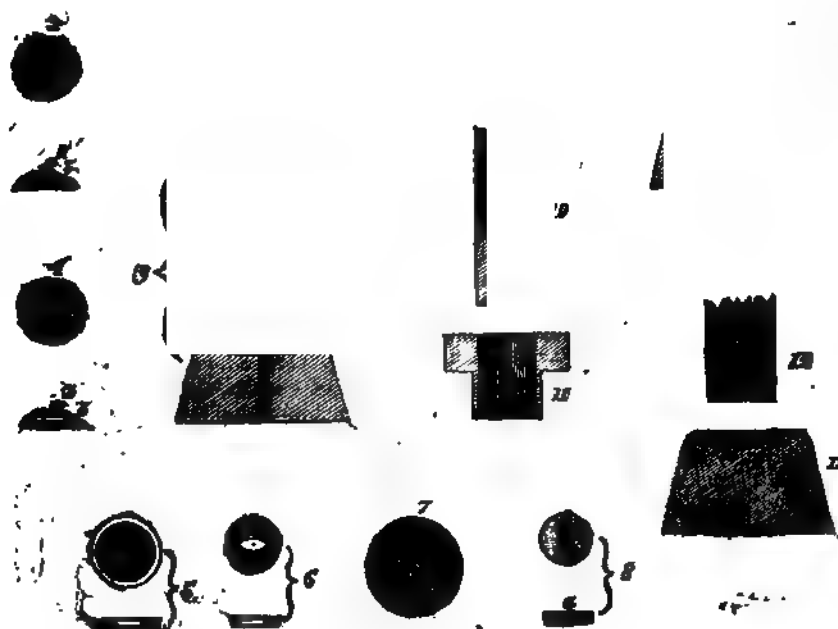

My invention (says Mr. Aston) relates to that description of buttons commonly called "flexible shanks," wherein a tuft of thread or woven fabric is made to pass through an opening in what is called a collet, such tuft protruding outwards for the passage of the needle when in the act of attaching this description of buttons to a garment.

Fig. 1 is an edge view, and fig. 2 a plan of one of the old construction of buttons, *a* being the protruding tuft of thread or woven fabric; *b*, the ordinary collet. Objections have been raised against these buttons, owing to the flexible tuft, by which the button is attached, coming in contact with the sides of the button-hole, and quickly wearing the same away, and making it have a shabby appearance; and this has been found to be the case to a much greater degree than with the covered buttons which were formerly very extensively in use, and in which the covering was performed by hand with the needle. Now the intent of my invention is to obviate the objection above mentioned, by an improvement in the construction of the metal collet to be used in the making such description of buttons, by which I am enabled to use a flexible shank which does not protrude, and thus admitting of such buttons being set more closely to the cloth to which they are attached, and as there are no protruding shanks, the only parts which will be within the button-hole of the garment will be the threads by which the buttons are sewed or attached, and in this particular they will very much resemble the buttons covered by hand and with the needle.

My improvement consists in giving to the metal collet of the button an oblong hole, having the threads which act as the flexible shanks laid across the short axes of such oblong hole, as shown in figs. 3 and 4, there being a soft substance or padding below the threads, which comes in contact with the face of the garment to which such button may be attached.

Fig. 3 represents an edge view of a button constructed according to my improvement.

Fig. 4 is a plan thereof. In both of these figures it will be seen that the hole formed in the collet, *b*, is oblong; whilst it will further be seen, that the threads, *a*, which act as the flexible shank in this button, are held across and at right angles to the length of the oblong hole, at the same time such threads do not protrude, but lie close on the surface of the padding, which forms part of the back of the button. It will be evident, that by having the hole formed oblong, the needle may with facility be passed under the threads of the flexible shank in the direction of the length of the hole of the collet, as is shown by the dotted lines, and it is the facility thus offered of passing the needle in that direction, which renders the pro-

trusion of the flexible shank unnecessary, and it is with this view that the hole in the collet is made oblong. The threads which form the flexible shank will be securely held down across what may be called the shorter axis of the oblong hole, only a very small part being left uncovered, and, consequently, will not be liable to stretch.

Having thus described the nature of my invention, I will describe the best manner with which I am acquainted for making buttons according to my improvement.

Fig. 5 represents a metal shell, similar to those which are ordinarily used for making this description of buttons.

Fig. 6 shows the metal collet, the difference between which and those heretofore used is, that the hole is oblong, for the purpose before described. I would here remark, that these shells and collets are made by the fly-press, as is well understood.

Fig. 7 represents a piece of silk, or other woven covering of the button.

Fig. 8 is the padding which lies under the collet, and it has wound round the thread, *a*, as shown in the drawing, which acts as the flexible shank to the button. This padding consists of several layers of soft paper, having a piece of silk or other fabric similar to the covering of the button: this piece of silk, or other fabric, forming the surface which comes in contact with the face of the garment to which the button is attached.

Fig. 9 represents a section and plan of the die or mould into which the parts of the button are first put, in order to bring the parts properly together previous to their undergoing the final pressure by which the button is completed.

Fig. 10 is the punch to the die or mould, fig. 9, which is shown partly in section, by which it will be seen to be countersunk.

Fig. 11 is a hollow tool by which the edges of the covering of the button, fig. 7, are gathered together and laid over the edges of the shell, fig. 5. When the covering, fig. 7, and the shell, fig. 5, are at the bottom of the die or mould, fig. 9,

which will be clearly seen in fig. 12, where these parts are shown together ready for receiving the collet and the padding, having the threads, *a*, wrapped around it, and lying at right angles to the length of the oblong hole of the collet. In forming a button, the circular piece of silk or other fabric, fig. 7, is to be first placed on the face of the die or mould, fig. 9, at the points, *c c*, the face of the die or mould being sunk to receive it; a shell, fig. 5, is then to be placed on the surface of the covering, fig. 7, and the two together are to be pressed down to the bottom (by the punch, fig. 10,) of the die or mould, fig. 9, in doing which the punch will enter the shell and guide it down. The punch is then to be removed, and the hollow tool, fig. 11, is to be forced down into the die or mould, by which the edges of the silk or other covering of the button will be forced towards the centre of the die or mould, and, consequently, overlap the edges of the shell; the collet, fig. 6, containing the padding, is then to be dropped into the mould or die through the hollow tool, fig. 11, the collet being uppermost. The punch, fig. 10, is the next to be forced down with pressure through the hollow tool, by which means the collet, the padding, and the edges of the outer covering of the button, will all be forced into the shell, fig. 5, which will retain them sufficiently secure till the button undergoes the final pressure for completing it. The button thus far produced is to be removed from the die or mould, fig. 9, by a wire, which is passed up through the mould for that purpose, as is the usual practice.

Fig. 13 is another die, and fig. 14 is a punch, by which the final or completing pressure is given to the button. The nature of the counter-sinking of this die will be evident on inspecting the drawing; and it will be seen that the punch, fig. 14, has a plain face. The button, on coming from the die or mould, fig. 9, is to be placed with the collet downwards, and the same is pressed into the die, fig. 13, by the punch, fig. 14, at the same time

the workman holds a piece of tissue paper between the button and the punch, to prevent the face of the button being injured in appearance by the punch.

Having thus described the nature of my invention, and the manner of carrying the same into effect, I would have it understood, that I lay no claim to any of the tools or dies or parts of the button herein shown and described, they being similar to those heretofore used in making like kinds of buttons; nor do I claim the making of the flexible shank (or part by which the button is attached) of thread; but I would have it understood, that what I claim as my invention of an improvement in the manufacture or construction of buttons, is the manufacturing or constructing covered flexible shanked buttons with collets having oblong holes, by which the flexible shank is not required to protrude, but the button may with facility be sewed or attached to the garment by passing the needle under the threads, *a*, in the direction of the length of the oblong hole as above described.

Enrolled January 10, 1835.

**JUST DEPARTURE.**—The tragical fate of a meritorious engineer, *Phineas Davis*, who was crushed by an accident on the Baltimore Railroad, was noticed some days ago in this paper.

In the ninth annual report of the Chesapeake and Ohio Railroad Company, the following just tribute is paid to the character and services of this ill-fated individual:

Phineas Davis was the first who constructed an engine, capable of being used on the road, in which anthracite fuel was successfully employed. With untiring patience, he bore disappointment after disappointment; and the eminent and splendid results, which ultimately rewarded his efforts, are ample testimonials of his genius, and will identify his name, most honorably, with that great system of internal improvement, which is yet to work so many and such important changes in the relations of society. Of a quick and clear conception, in matters relating to his profession, he possessed a calm discriminating judgment. The warmth and energy of inventive talent were tempered by a prudent foresight and great practical skill. He seldom, therefore, took a step, which was not a secure one; and the success of his suggestions, when put into practice, gave them, from the first, almost the same weight as if they had been the dicta of experience. His private worth and unassuming manners, were not less remarkable, than his rare abilities. The Board deeply regret his loss, and hold his memory in sincere respectful and consideration.

(From the New-England Farmer.)

**Poor Laws of Great Britain.**

We received the Edinburgh Quarterly Journal of Agriculture for June, some weeks ago; and now proceed to take some notice of its contents.

The first article is an elaborate comparison of *The Poor Laws of Great Britain*, from which it appears that the poor have been much more judiciously managed in Scotland than in England. We select one paragraph to show the difference between the laborers of those two countries.

"The mode of living in Scotland has been lower than in England; and hence it is less expensive to provide for a poor man here than in the south. An English laborer thinks himself starved, if he does not daily eat butcher-meat and white bread, and drink malt liquor; whereas in Scotland milk and meal (oatmeal) make a plentiful house, and our ablest ploughmen take nothing more. Potatoes, which the children of our gentry prefer to bread, are re-

garded with considerable scorn by laborers in the south of England. What an English laborer spends on his bacon, beer, and white bread, is in the hilly parts of Scotland spent by the Scottish laborer on the education of his children. Nay, the most intelligent and popular of the English periodical writers, William Cobbett, M. P. seems to have no idea that better can be done for English laborers than to feed them well with bacon, bread and ale. He does not appear to think them capable of rising to intelligence, or finding their highest enjoyment in the cultivation of their minds, as religious and moral beings, and in the ambition of educating their children to the possession of accomplishments not enjoyed by themselves."

An eloquent advocate of Temperance in our own country, has said, "The drunkard knows that when he shall have spent his all and become a pauper, he will have a better claim to your property than you have; and that his support will be provided for, whether your estate can support you or not." In some parts of England, this principle has been carried out into an alarming extent; and the following startling facts will prove that pauperism has there become an intolerable burden:

"Out-door relief to able bodied persons is also given in money, and first without requiring labor in return. The applicant pleads that he has been unable to obtain full work, that he has lost a day or two, &c. On such pretexts, young men demand from the unlimited resources of the parish an indemnity for their loss. Young men in this way often receive 2s. 6d. or 3s. per week; and employing their time in depredations of various sorts, do no work whatever.

"In winter generally, a laborer in the country comes on the parish, whatever he may have earned in summer. It is enough that he is now in want, having no work, or short work and short wages.

"Many parishes oblige the occupiers of property to employ the applicants for relief at a rate of wages fixed by the parish; and depending, not on the services, but on the wants of the applicant, the employer being paid out of the poor-rate all that he advances in wages above a certain sum.—The conduct or ability of the laborer as a workman is not regarded.

"Parishes sometimes employ in actual labor, and pay wages to the applicants for relief who say they have not found employment. They are set to dig gardens or fields, or to work on the roads. Such labor has in all cases proved most unprofitable; little or nothing is done; the men have indulged themselves in utter laziness; and usually become so infamous, that no body will employ them. Whatever his previous character may have been, parish employment of an individual though occasionally on the roads, ruins him as a laborer. Every principle of industry is violated. When the single man gets 5s. the married man for the same work gets 10s, so that they are made to feel that the work and the wages have no true connection. The sense of shame is soon obliterated by habit and example. Attempts to treat the deserving better than others, have always done harm. It excites murmuring, and ultimately to satisfy the clamors of the undeserving, the scale of relief is raised.

"By subsistence in a poor house, the paupers in England usually remark that they were better there than they ever did before.—They have excellent apartments, good beds, and abundance of the richest food. They live no doubt in the society of many bad or profligate persons, but to this they become accustomed; and children brought up in the

workhouse are extremely apt, when places have been got for them, to desert their service and return to the workhouse. In general the workhouse is a large almshouse in which the young grow up in idleness, ignorance and vice; the able bodied are maintained in sluggish sensual indolence; the aged and more respectable exposed to worthless society; and the whole body of the inmates subsist on food, far exceeding both in kind and amount, not merely the diet of the independent laborer, but that of the majority of the rate payers.

"It will not appear surprising that this system of poor laws is popular with the inferior orders of society. The laborer feels that it gives him perhaps low wages, but always easy work and independence. He need not bestir himself to seek work; he need not study to please his master; he need not put any restraint upon his temper; he need not ask relief as a favor. He has all a slave's security for subsistence without his liability to punishment. As a single man indeed, his income does not exceed a bare subsistence, but he has only to marry and it increases.—If he abscond and desert his children, he knows they will be well taken care of.

"In consequence of this perpetually increasing evil, the English nation, for the year ending 25th March, 1832, paid in poor rates the sum of £7,036,968; although in that year the price of corn was extremely low.

"It appears that in one parish, that of Cholesbury in Bucks, the collection of the poor rates in 1832 suddenly ceased in consequence of their enormous amount. The landlords gave up their rent, the farmers their tenancies, and the clergyman his glebe and his tithes. It was found that even by dividing the whole land of the parish among the able bodied paupers, these able bodied paupers would be unable to get their bread out of it without aid, during two years, from the neighboring parishes; and that after all, the aged and impotent must remain a permanent burden on these neighboring parishes. In other quarters, farms became untenanted, or the rent reduced to a half or less, on account of the poor rates. The Commissioners\* mention a farm in Kent of 420 acres of good land, tithe free and well situated, which had just been thrown up by the tenant on account of the poor rate. Near Aylesbury they mention forty-two farms untenanted. At Thornborough, Bucks, 600 acres unoccupied, and the greater part of the other tenants had given notice that they were to quit their farms. Many other places are mentioned as in a similar state from the same cause.—Generally after 1820 this disastrous result was proceeding gradually over England, in consequence of the increasing burden on the possessors of land.

"The soil of England has of late been hastening fast to become the inheritance of the poor, without enriching them, because the same poor rates keep them down which had brought down the former proprietors.—Divide the land of a parish among the poor, and they are speedily oppressed by the necessity of supporting the progeny of improvident marriages whom the poor laws oblige them to maintain in affluence.

"Good ploughmen are not to be found. The laborers say they do not care to plough, because that is a kind of work which if neglected will subject them to punishment; and if properly done requires constant attention, and the lads do not wish to learn. Nine

\* Appointed by his Majesty "to make a full and diligent inquiry into the practical operation of the Laws for the relief of the Poor in England and Wales."

able bodied young men were in the workhouse last winter; such was their character that they were not to be trusted with thrashing. When the bad season is coming on, the laborers frequently dispose of any little property they have, such as a cow or a pig, so as to entitle them to parish wages. The workman tells his employer he does not want his work or his wages, he can do better on the parish.—By an old experienced laborer it was supposed that one laborer forty years ago, would do more than two of the present day.

"One great evil has been that those laborers who retained their independence could get no employment, because the farmers were constrained to employ the bad workmen. Take the case of Wm. Williams, a hard working industrious married man, who had acquired two cows, and a sow and ten pigs, and saved £70; he also got a legacy of £46. The consequence of this was that no one would employ him, although his superior character as a workman was well known. He told me (says the employer) at the time I was obliged to part with him, 'while I have these things I shall get no work; I must part with them all; I must be reduced to a state of beggary before any one will employ me.'

"Matters soon came to this, that mothers and children would not nurse each other in sickness until they were paid for it by the parish, which was accordingly done.

"But all these effects of the English poor laws seem slight compared to their effects on the morals of the female sex of low station.—

"In Great Grimsby, the overseer says that most of the relief is altogether unnecessary; but he is convinced that if an abatement were attempted, his life would not be safe; he looks to the farmers for support which they dare not give, considering that their lives and property would be in danger.

"At Great Gransden the overseer's wife told Mr. Power that two paupers came to her husband, demanding an increase of allowance; he refused them, showing at the same time that they had the full allowance sanctioned by the magistrate's scale; they swore and threatened that he would repent it; and such was their violence, that she called them back, and prevailed with her husband to make them further allowance.

"The question is apt to occur, Why did not the English Legislature at once adopt the Scottish system? The answer is, that the pretended omnipotence of parliament would have been unequal to the task of carrying such a reform into effect. To withdraw five millions sterling from the subsistence of able bodied persons in England, would have produced a convulsion, to encounter which the resources of the state, either civil or military, must have proved unequal."

In our selections, we have omitted many disgusting details, and now willingly turn from this dismal picture to the urbanity and pleasantry of our author's concluding lines:

"We of Scotland wish every degree of success to our bretheren of England in their attempt to heal a gangrene of 250 years' endurance, which appears after all, not so pernicious to the rich, whose wealth only it effects, as to the poor, whom it sinks into a state of intellectual and moral degradation; and who but for this evil in their institutions, form naturally the best, the bravest, the most generous, and the noblest race of human beings that have hitherto appeared on this globe,—excepting always, of course, their northern neighbors and admirers."

## NEW-YORK AMERICAN.

OCTOBER 17—23, 1835.

## LITERARY NOTICES.

THE NORTH AMERICAN REVIEW, Number LXXXIX; Boston, CHARLES BOWEN; New York, G. & C. CARVILL & Co.—It has already been announced in the journals, that the editorship of this Review has been transferred to Mr. Palfrey, who, upon all hands, is admitted to be admirably qualified for such a station. We know not, whether this number is of his preparation and supervision, but are sure it is a very good number. We annex a list of the contents.

ART. 1. Gurley's Life of Ashmun; 2. Modern Law of Nations; 3. Matthias and his impostures; 4. Classic Mythology; 5. The Laboring Classes in Europe; 6. Dr. Channing; 7. Study of Natural History; 8. Mrs. Sigourney and Miss Gould; 9. Thomas Carlyle; 10. Worcester's Dictionary; 11. Travels of Reed and Alatheson,—Colton's Four years in Great Britain.

There is variety enough in this list. Let us speak briefly of some of the articles. The first, on *Gurley's Life of Ashmun*, interested us much. We have not read that life, and know but little of the merits and character of Ashmun. We need not say that now, we shall read Gurley's book, for it treats, as the Reviewer shows, of a man, who, in any condition, and on any scene, would have acquitted himself with distinction. This volume, and its hero, are thus introduced by the Reviewer:

This volume is both a just and generous tribute to the memory of a good man;—one of the martyr school,—whose names "smell sweet, and blossom in the dust." The capacities of his character were such, that had he lived in any age or country, their energy must have hurried them into development, and distinction too, as inevitably as the waters flow to the sea. They did so as it was; regardless indeed, apparently, of their destiny for a while, and wavering here and there by "many a winding bout," through subterranean realms of shade; yet true to themselves, through all things,—purified by the filtration they encountered,—accumulated,—accelerated,—and so struggling, and still struggling, onward and farther on, till finally the daylight gleamed, and they poured themselves forth to the sunshine, in the rejoicing rush of the cataract. Obscurity, poverty, persecution, disaster, passion,—what a history of them is recorded here; and how vainly do they, each and every one and all together, contend with the unconquerable will!

These things, we know, have become comparatively common in our times,—almost commonplace. It is emphatically the adventurous age we live in. The Argonautic was not half as much so. The Roman was tame in comparison. The Chivalrous was sluggishness itself. The spirit which belonged then to individuals, belongs now to the era. That which was little above the physical propensities,—the blind impulse of ambition or acquisitiveness, or both,—and was busied almost exclusively, of course, like the strong man's phrenzy, with wreaking its vengeance and wasting its vigor in sightless strivings to pull down the pillars of the great sanctuary of society, even over his own head, that spirit (if it can be called such,) is subdued at length in some good degree into subordination of the intellectual, social, spiritual instincts of man.—New avenues are opened to his energies in these departments; the world is no more divided between a camp and a charnel-house. Mind, instead of force, has become the arbiter of nations; mind is the medium of influence, the measure of advancement, the minister to the gratification of those old longings of humanity, which, though never to be reasoned out of it, may yet be, and have been a thousand times reined. A diligent minister it is,—indefatigable indeed, but willing and discretionary,—admitted to the privilege of advising and to the participation of results,—a companion and counsellor, more than a slave.

The spiritual instincts, strictly, are included in the catalogue of resuscitated powers. The manifestations of these are in their nature noiseless, and void of ostentation; and their achievements are the same; but they are none the less real, nor the

less considerable, for the want of those qualities which most attract the admiring gaze of men. The missionary spirit, alone, were sufficient to characterize the age. It is the missionary age, not less than the mechanical, or the mental as those have severally described it who chanced to be engrossed by its changing aspects;—it is the age of each and all,—the age, as we began with saying, of adventure. The application of steam to purposes of navigation was an adventure. The railroad was another. Every discovery of science, and every application of it in art and in practice, were others. So was the American Revolution; and so was the French. So was the Temperance Reform; and so was the Bible Society, and the whole organization of the Public Benevolence; and the scheme of the Education of the People;—all of them and myriads more, harmonious issues of that stupendous source of sublime events and experiments,—the mind of man,—fairly awakened at last from its slumbers, and as a giant refreshed, relieving its panting energies with the luxury of adventure.

The life of Ashmun lay in an important division of this great field of enterprise. He devoted himself early to the cause of African Colonization,—itself one of the noblest demonstrations of the enlightened intellect, and courageous but considerate enthusiasm of the times. At a critical period in its history, he became its ruling director; and for years afterwards,—the pregnant years of the formation of its first character,—the responsibility of its whole regulation depended upon him alone, as the Colonial Agent of the Institution. Nor is it too much to say, that the absolute preservation of the Colony, and its present existence, may be ascribed to his incredible exertions of an equally incredible energy; united, indeed, with an extraordinary firmness in other respects, for the place he was found in, at the momentous juncture referred to.

In the following reflections, there is matter of warning, as of regret. It is sometimes said, jeeringly, that few persons die of too much application to study, but in many an instance, besides that of Ashmun, the stamina of the constitution, have been undermined by too earnest and constant application:

The young man's incessant application, as might have been expected, soon compelled him to abandon his studies altogether for a time, and to travel through Connecticut and other sections, for the restoration of his health. Doubtless, though he apparently succeeded in its recovery to a tolerable extent, it was but just tolerable after all; and there can be no reasonable question that at this period were established the incurable sources of that irritability and feebleness which covered so much of his after life with gloom, and so much thwarted his most anxious desires, and finally, in the prime of his days, forced him to yield to the trials of a foreign climate and a laborious station, after struggling for years with both, through mere exhaustion of this early enfeebled frame. How filled are the annals of American Colleges with cases of this kind! What hundreds of young men, with bodies and minds like those which Ashmun possessed at the outset, and with such character too,—such energy, ambition, zeal to be useful;—have thus broken themselves down in the fine flower of a noble vigor, that, duly husbanded, might have made them the blessing and praise of the world. Who can estimate the loss to literature, liberty, religion;—the loss from disease, and from death, alike—the loss in what has been done, and what has not been, and in how it has been done; to say nothing of the misery endured, and the imbecility entailed, and of the ultimate incalculable influences of all, including the contagion of evil example, on the generations yet to follow us!

ART. II. presents a rapid sketch of the origin and growth of that international code, called the Law of Nations. A code by which, it is assumed, that civilized peoples do govern themselves in their intercourse with each other—but which, more than any other, is liable to be affected by that sort of make-weight, which the Gauls especially, from the time of Brennus have been accustomed to throw into the scale—the sword.

ART. III. justly pronounces the history of Matthias's imposture to be a "bitter satire upon the

age and country." Would only that the exposure of the delusions and villanies it records, might have the effect of abating the fanaticism in which they alone can live.

ART. IV., on the Classic Mythology, is a paper of merit, research, and originality. We subjoin an extract that will strike our readers.—[Omitted for want of space.]

And here, for the present at any rate, we must stop with this Review.

AN ATLAS OF OUTLINE MAPS; intended for the use of Students in Geography. New York, H. GRIFFIN & Co.—The object of this small *folio* Atlas, containing eight skeleton maps, viz: the two Hemispheres—the four quarters of the Globe—dividing America into two maps—and the United States—is, we presume, by giving the outline or form of each division, to afford to students the opportunity of filling up the sheet; so that, by thus ascertaining for themselves the relative position of different countries, and setting them down in their proper places, the facts may be the more indelibly impressed upon the mind.

NORMAN LESLIE, a Tale of the Present Times. 2 volumes. New York, HARPER & BROTHERS.—These volumes, it is sufficiently known, by reason of excessive preliminary announcements and flourishes in the newspapers, are from the pen of Mr. Fay, one of the Editors of the N. York Mirror, and known too favorably, by previous writings, to make it, one would have thought, a matter of good taste, or of expediency, to precede their appearance by such indefatigable puffing as we have witnessed.

This fancy sketch, founded in part on real incidents, is dedicated to a name new in letters, Colonel HERMAN THORNTON! New, did we say, in letters? Not so—for his countrymen have within a few months been edified by the publication of a diplomatic correspondence undertaken by him, in order to vindicate the right of every free American to be presented at foreign courts! These letters, not less by their literary merit than their patriotic and truly republican! design, made the name of their writer familiar as household words—and now, when both *Colonel* and *Mæcenas* are added to that name, it cannot wholly die.

But to our book,—shall we truly say, what we truly feel, that it disappointed us? It is even so. It lacks discrimination in delineating character; and its women, especially, are such as the world it treats of, could not know. The story is unskilful and artificial. The incidents, either very commonplace, or hugely impossible, and the tone of conversation, male and female, bad, decidedly bad. In all that makes, or aims to make, this a story and painting of real life, it is, in our judgment, a failure. But when the author surrenders himself to the revellings of his own feelings and imagination,—when, as in more than one fine chapter in the second volume, he speaks with the true unction of an artist, of the enthusiasm, the mortifications, and yet the alluring excitements of an artist life, we feel that he is no common writer.

The following reflections, after a feverish and heated ball, whence the hero of the tale, *Norman Leslie*, had just come forth, into the stillness and lifeliness of a great city, wrapped in darkness and slumber, though not remarkable for any thing particularly original, are natural and impressive:

The young man walked on; there was a fever on his cheek and in his heart. There is a singular power in the calmness of night, and in the holy silence and order of nature, upon the imagination of one suddenly freed from the giddy throng and glare of a revel. How it hushes the ordinary passions! The mind, which has been like a stream disturbed, settles into a wonderful clearness; and

you see defined thoughts and minute feelings far down in its transparent depths. But night is nowhere so impressive and solemn as in the worn haunts of a mighty city. You behold the abandoned paths with something of the feelings with which you pause among the ruins of an ancient town. True, in the one case ages have rolled away since the solitude was broken by eager and thoughtless steps; and in the other, only hours: yet the effect upon the observer is strangely alike. The human sea has washed from its shores, and left the marked and naked channels exposed to the eye. The clash and roar of worldly interests have died away; you tread the solemn aisles, half-disengaged from earthly anxieties and excitements, with the cold and passionless loneliness of a spectre. Are there those sleeping around who have awakened your hatred? how its secret fires seem dimmed and burned out! Can you look upon the heavens, strown with mysterious and eternal worlds, lying in the same bright places for ever!—on which all the great of history, Homer, Socrates and Alexander, Sylla, Cæsar, and Pompey, Mohammed and Jesus, have fixed their eyes—upon which the startled imagination cannot conjecture for how many thousand years to come, other immortal heroes and poets may gaze,—can you look upon them, and hate one of the myriads who are floating away with you, beneath their calm faces, like the specks that hang in their beams? Can you—exalted, purified as your mind then is—hate any less object than those evil principles, those tremendous passions and vices, which have clouded the paths of human beings with darkness and woe?

But if you have been guilty of a rash action, if you have been the yielding victim of some momentary impulse or local interest, how wondering and abashed are you in those holy moments! How noble then does virtue appear! How vast and high seems love! How unutterably insignificant and mean those motives and influences which tempt the energies and guide the destinies of the human race!

Of his power of description, we subjoin this sketch of Rome during the carnival.

Whoever has not witnessed the festivities of the carnival week at Rome will scarcely lend credit to the burlesque extravagances even to this day committed by all classes. It is a page of reality resembling one of old romance; and the stranger wonders to see its antique and remarkable leaf thus bound up in the prosaic volume of common life.—The grave and sensible Englishman, the observing and intelligent American, is astonished at the spectacle of a whole people abandoned to the maddest freaks of frolic and fancy—disguising themselves in grotesque habits, masking their faces, altering their gait, form, and demeanor—entering with lively ardor into the wildest folly. From the violent gesticulations and various costumes it appears as if the theatres of the world had emptied their wardrobes, and sent forth their performers to play each in the face of Heaven those thousand parts in other countries—at least in ours—reserved for the midnight stage. Here a brigand stalks in the full glory of arms and equipments, with flowing tresses, dark mustaches, and a countenance of more than human ferocity. He steals along after the rolling carriage, and aims his carbine at some beauteous victim. There a Spanish lover, with his graceful cloak, broad hat and feathers, and love-breathing guitar, sings his serenade to each passing fair: sometimes, for the occasion excuses all civil familiarity, he murmurs a soft air to an English belle in her carriage; sometimes whispers love to the gay French girl; sometimes kneels to the *Contadina* in the street; and again, directs his strain to a bright face peeping from a palace window, or leaning and laughing over a balcony. Behind him stalks a knight glistening in armor, who bears upon his lance the favor of his lady-love, or hands a letter on its point to the first pair of eyes that take his fancy—stranger or native, high or low. The fierce Saracen stalks through the throng, brandishing his cimeter and twirling his mustaches. The copper-colored Indian with his tomahawk threatens swift destruction to each shrinking maid. Old lords and ladies, in dresses of antique magnificence, recall the splendors of the most celebrated courts. The frolicsome sailor reels along, as if the light Italian wines had been too strong for his brain.—The lover sighs—the warrior shouts—the spectre glides; and many striking characters are correctly dressed, and represented with serious accuracy and excellent effect. Others there are who delight to

fling over the whole the broadest possible air of ridicule. Humpbacks swelled into mountains—eyes glaring like moons—huge mouths—bald pates—overgrown stomachs—statues of twice the ordinary size—deformed foreheads—and noses of such ponderous dimensions, magnified proportions, and rubicund colors, as may chance, if you eat too heavy a supper, to haunt your late slumber in the shape of an incubus—all that mirth and ingenuity can invent to distort and caricature, here floats upon the vast and ever-moving tide, rising and sinking in the dense, universal commotion—disappearing, and appearing again; carriages loaded with double numbers—horses rearing with two and four—women seven feet high, and sweet girls in uniform of banditti. Those whose ambition does not seek to support distinct and memorable rôles content themselves with the simple smooth common mask—a pretty girlish countenance, whose everlasting repetition at length wearies the eye, and becomes no theme of curiosity or distinction.

Some, too—so picturesque are the inhabitants of Rome—even while wearing their every-day habiliments, can with difficulty be distinguished from the maskers; and the bare-footed and cowed monks and friars—the long-bearded mendicants, covered with rage and wrinkles—the fat priest, and the stern soldier, are only known from the giddy surrounding concourse by their unmasked faces, their steady step, and their grave demeanor. Nearly all the town join in this sport; or, if they do not actually participate, at least throng together by thousands and thousands to witness it and swell the extraordinary spectacle. Countless numbers of ladies, both natives and foreigners, may be seen either in their carriages or at the windows—gentlemen and noble, young and old, peasant and duke, all mingled and blended together in a wild, excited, half-familiar, half-merry, half-mad mass of human beings—crying, laughing, screaming, gesticulating, leaping, dancing, singing, shouting, and pelting each other with flour sugar-plums, or oats steeped in plaster of Paris resembling them, and covering the air, the street-walks, and all the population, with the white of a universal snow-storm. A hundred thousand people are not unfrequently assembled, either as actors or audience, upon the scene of action, which is in the Corso and the adjoining streets, squares, and avenues.

Our readers, on either side of the ocean, need not be reminded that the Corso is the Regent-street, or Broadway, of modern Rome, straight and exceedingly narrow, built up closely on both sides with high houses, or gloomy, but immense and magnificent, old palaces, all of which are crowded upon every point; where men and women sit, stand, or climb from roof to basement, cornice, pedestal, and balcony. Through this principal thoroughfare two processions of carriages and pedestrians go slowly, in opposite directions, pelting each other, and all around them and all above them, with snowy tributes; and receiving in return discharges in showers from every quarter. The middle of the street presents a tide of the gayest and gaudiest colors, and the most lively motion—not unlike the rapid air and agitation of a fierce battle. On either side, tiers of seats—a most lucrative profit to the proprietors—are provided for the thousands who desire, stationary and secure, to behold the giddy scene. A sloping bank of faces thus rises on either hand of those moving in the procession, leaving only a passage sufficiently wide for the two rows of carriages to pass each other.

LEGENDS OF A LOG CABIN; by a Western Man; 1 vol., New York, GEO. DEARBORN.—So much has recently been written about the west, that the appearance of this volume did not awaken the interest in us, which the publication of a new native work seldom fails to create; and we confess that it has now lain for three Saturdays, upon our table, without our having even turned over the leaves, until the last moment. When opening it for the first time, however, we at once discovered its claims to consideration, upon recognizing some passages of thrilling power, which were copied into our columns, from the *American Monthly*, in which they originally appeared. A subsequent examination of the volume sustains the estimation which we had formed of the author from these specimens of his skill. He is certainly a writer of no common powers; and if this

work be the harbinger of future literary efforts our "western man" is destined to an enviable place among the most popular authors of the day. Vigor and versatility, a flowing and energetic style, touching pathos and racy humor, eminently characterize this collection of tales, and with these elements of good writing, practice alone is wanting to make their possessor a master of his craft.

The "Hunter's Vow," which is the chief of these legends, is decidedly the best back-woods story that we recollect to have met with, though the peculiar powers of the author are displayed with equal force in both the story of the "Frenchman," and "The Wyandotte." His forte lies in a certain familiar and naked way of relating the most appalling incidents, so as to invest them with a horror, which, as in the last moments of *Orestes*, and the frightful fate of poor *M. Girond*, who "left town suddenly," approaches to the grotesque.

The hero of the principal story, is a youth of twenty, whom ill health has prevented from learning the wood-craft necessary for the education of a backwoodsman. The "doctor" of the settlement had lent him books to beguile his long sickness. "And these," in the words of an old borderer, who tells the story, "were in the end, the means of ruining the boy; for as he grew stronger, instead of taking to the woods and earning his bread like a man, Ham Cass was forever poring over old musty books." The reproaches of his sweet-heart because he will not put in for the prize in rifle-shooting, are launched in vain, against the wilful student: His old father, too, takes it very much to heart, that he has no companion upon his hunting excursions, and he grieves, as the cares of age thicken upon him, at having no one to assist in sustaining his household.

One morning as he was getting ready to start for Fletcher's Island, where he had some 'coon traps, the old man seemed very low; at last he broke out,—"If it had pleased God to spare James, I would not need to go alone to risk my old scalp among the red skins."

At these words, Ham jumped up from the stool where he had been, as usual, poring over a book—"Let me go with you, father. I will go with you."

"You, boy!" said the old man with a sigh.—"No! no! that will never do. You do not take kindly to the woods, and it's no use forcing nature. No! no! stay you at home, and help Betsy."

For the first time in his life Ham seemed to feel some shame at being thus turned over to help at women's work. He begged hard to be allowed to go, and was so earnest that the old man consented. He still would cherish the hope that the boy might yet take to the rifle; a father does not readily give up hope of his only son. They both entered the canoe, and went down the creek. To encourage the boy in his new found spirit for the woods, the old man began to tell one of his early hunts in Virginia, but he had not yet warmed in his story, when, on looking up in his son's face,—'twas clear the boy was day-dreaming—he watched for a moment, then sighed. "Well," thought he, "it is no use forcing nature, the boy does not take to the woods, nor to the rifle, nor to any thing that is of use, as I see. We may as well let him have his own way, and if all goes well, some day or other he may make a schoolmaster if they ever want any thing of the kind in the settlement." With these thoughts in his mind, they arrived at the first trap, which was on the main land, near the mouth of the creek; here they found a large otter and two 'coons. The old man was in high glee with his luck, and they were soon busy taking the skins.

Ham was not very good at the work, and before he had half finished skinning the 'coon, he cut the pelt in so many places it was hardly worth the trouble of taking off, and finished by planting the knife pretty deep in his own hand. This, of course, put an end to work for that day; and when he had washed and bound up the cut, Ham set himself down on the bank, took out and old volume, and was soon deep in his book as usual. The old man finished his work alone, and having got all ready

to start for the island, he gave Ham a call to step into the canoe. Three times calling roused Ham from his book, evidently very loth to leave it. The old man saw that his son did not care to be disturbed, and wishing to please him in every thing, proposed that the boy should sit on the bank and wait his return. Ham caught at the word, and before his father had fairly pushed off, he was fast as usual to his book. How long he remained there it would be hard to say, for Ham Cass was not very apt to measure the time when he had a book in his hand, he was roused by the sharp crack of a rifle, a loud whoop, and a scream of mingled fear and pain. He looked up; the island, which at the near end was about one hundred yards from where he sat, was covered for the most part with tall rank grass, very few trees, and no brush-wood of any consequence; so that from the high bank he could command a view quite across the island: Through this grass he saw his father running for life, pursued by a tall Indian. The old man gained the shore opposite to where his son stood, the Indian, tomahawk in hand, close behind. "Fire! fire! boy," shouted the old man. The boy seized his father's rifle, which the kind old man had left behind lest harm should come to the boy, and he having nothing to defend himself; he fired, the ball skipped along the water, far below the island and twenty yards from the mark. The Indian raised a shout of triumph, the white man a shriek of despair; still, he had one chance for his life, he might reach the canoe, and push off before the savage could overtake him; he gains it, but the Indian is close at hand; one push, the light bark floats upon the stream, he springs in, grasps his paddle, but ere it touched the water, the tomahawk came, whizzing through the air, and buried itself deep in the old man's skull. With an exulting shout the savage sprang upon his falling enemy, and plunged the knife into his heart; and while the poor boy was trying in vain to fire the rifle which he had hastily loaded, he saw the scalp torn from his father's head by the Indian, who again raised his loud war-whoop. Then, as if in mockery of the attempts of the boy at revenge, he tossed the scalp into the air, catching it as it fell; repeated the feat again and again, shouting and whooping all the while in the full enjoyment of gratified ferocity.

Ham Cass stood gazing on the murderer of his father as if the frightful spectacle had turned him into stone; and it was not till he heard the ramrod of the Indian ring in the barrel of his gun, that the boy recollected that his own scalp could only be saved by putting the high bank betwixt him and the Indian's rifle. He ran, without knowing whither,—chance directed—he took the road towards Harmer, the settlement four miles below; but ere he had passed half the distance, at a sudden turn in the road he came upon a scouting party—Bill Taylor, Jim Johnson, and myself,—who were out on a tramp. "Halloo! Ham Cass," said Taylor, "is that you? What brings you so far from your books and cousin Betsy? A rifle in hand, too! Have you taken to the woods at last like a man? Why Ham Cass," continued he, observing that the boy made no answer, "what is the matter, that you stand there staring like a stuck pig; are you dreaming?"

"Dream!—Dream!" murmured the boy, in a low unnatural voice. "Dream; yes it was a dream; that shout, that yell of agony, the tomahawk that crushed his skull, it was a horrid dream, a fearful dream." "Boy, you are dreaming yet, and talking in your sleep, wake up," and Taylor gave him a rude shake. I could not bear to see the old fellow use the boy so roughly, and spoke up; "Let him alone, Bill Taylor, let him alone, he will come to himself in a bit; sure something is wrong, see how his eyes stare, his hair is wet with sweat, the veins on his forehead are like whip cords, and look how his face works. Something has gone wrong. I pray God that old John Cass and Betsy may be safe and well. Hamilton, my poor boy! what ails you? speak out we are all friends."—"Friends! friends!" shouted Ham, catching a hand of each; "are you my friends, true, good friends? then you may yet save him; come, come to the river,—to the river. Oh! for a canoe; where—where shall we find one?" "Why, if that is all, Ham, our canoe is hid not twenty rods from here; but tell us, boy, what has happened?"

Hamilton had now sufficiently recovered his senses to give a confused, though pretty intelligible account of his father's fate, hurrying us all the while towards the river. The story was not ended when we arrived at the bank. Taylor and I

soon dragged our canoe from under some brush-wood where we had hid her, and we all took to the river. Ham now finished his strange story, and Bill Taylor broke out, "Did you fire only once, Ham?" "Only once," said he, "I tried to fire again, but the old thing—and he gave the rifle a push—flashed in the pan again and again." "Flash-ed," said Taylor, "that's queer, too; old Swiftsure did not use to behave so, let me look at the load." He fixed the screw, and drew the charge. "No wonder," said he, "Swiftsure did not go off. Why, boy! did you ever hear of a gun going off when you had put the ball and wadding first, and the powder on top? Look!" turning towards Johnson and me; "did mortal man ever see a gun loaded in such a way? Old John Cass's life has been fooled away by a poor slip of a boy that don't know how to load a rifle." Bill Taylor's compassion was all lost in vexation and contempt for a grown man who could not load a rifle. "I never thought so much book learning would come to any good.—Twenty years old and not know how to load a rifle!" Taylor went on grumbling and moaning, but after the first word Ham seemed not to hear him; he started when the mistake was first pointed out to him, and looked eagerly at the charge, but in a moment his face became calm and stern, he sat in the bow of the boat immovable as a rock, his eyes fixed on Fletcher's Island, which was now in sight. A short pull brought us to the spot; the Indian had gone off in the canoe, but we soon found the body of old Cass. He was quite dead, the rifle had hit him in the side, it was only a flesh wound, and did not prevent his running for life; but the tomahawk had done for him, and the knife pushed in just under the long ribs, would no doubt have taken the life, if life had remained. We all feared that the sight of the body would drive Ham quite crazy, but it did not; indeed, to my eye he seemed not to mind it at all; he looked cold and indifferent, and only spoke once when we proposed to take the body to the house. "No! no! to the settlement!—to the settlement!" We agreed. Taylor said it should go to his house, and be taken to the grave from thence. They determined to land Ham and me at the creek so that we might go up to the cabin to look after Betsy, while Taylor and Johnson took the body to the settlement; they promised to send a wagon for us and the few things of value in the cabin. We landed accordingly, and took, in silence, the path to the house.

The old man is buried, and a bitter interview ensues between his niece and the youth, who were betrothed. The latter disappears from the village, but returns in the evening to have an interview with the hunter who tells the story.

The good-natured settlers become concerned about the fate of the young Cass, and a scouting party is made up to overtake and bring him back, if possible. The expedition gives rise to a variety of wild-wood incidents, which enliven the action of the story, and develop more than one striking character with the most happy originality. Some of these animated episodes we shall take another opportunity of quoting. The fulfilment of the vow we leave our readers to learn from the book itself, to which these extracts will be a sufficient recommendation.

At that moment some one touched my arm; I turned, it was Ham Cass. "This way," said he, and he walked rapidly towards the woods. I followed, we were soon deep in the woods on the way towards the Cass cabin; I tried to say something to him, but when he turned his cold stony eye upon me, I could not speak. I had known that boy from a child; he was always gentle and shy, but very kind-hearted, and willing to do any thing that did not take him too long from his books; but now there was a something about him I could not understand—a firm determined look, a cool, decided, self-confident way, not at all natural to him, and which I confess, daunted me a little. At length we came to the cabin; Ham stopped in front, and took a seat, I sat down beside him.—"Balt Williams," said he, "you are the only one that has not cursed me for my folly and my wickedness in the murder of my father. I will prove to you, that, bad as I have been, I am not so bad as she called me,—I am no coward. But first, Williams, show me how to load the rifle," and he handed me his father's gun. I took it, and did as

he desired; he watched me closely; when it was done, "Now," said he, "let me see you fire at a mark." I showed him the sights along the barrel, and explained, as well as I could, how it was done. "It is too dark now, Ham, for a small mark; you see that blaze on the tree, I will hit that;" I fired and hit it. "Now," said Cass, "let me try." He took the gun and loaded it carefully, and as well as the oldest hunter in the territory could have done. I was surprised; we shall see, however, I thought, when he comes to fire; he has camped out somewhere or other last night, and his hand must needs tremble. I was mistaken; he raised the rifle to his shoulder, and as his eye ran along the barrel, the gun was as motionless as though it lay upon a rock; he fired, the ball hit the very centre of the mark. "That will do," said he; "and now, Williams, good bye." "But Ham, where are you going? you must not leave me, you must return to the settlement and see cousin Betsy." "See her! never;—she called me a coward, said I had no feeling, no heart, I that loved her as my own soul. This she said when my heart was broken with sorrow." Here I interrupted him; "Nay, Hamilton, you must think no more of this; she has said she was sorry; she was crazy, but now she longs to see you, and to beg your pardon, for she is sure you will forgive little cousin Betsy, to whom you have always been so kind." "Did she say this?—God bless her for it, but I must be gone; look here, Williams, I have provided for a hunt." He turned to the corner of the hut, and showed me his powder horn and bullet bag well filled, a small bag of parched corn, and a venison ham. "But where are you going, what, are you to hunt?" said I. "Where am I going?" echoed Ham, "what am I to hunt? Balt Williams, I am going to the woods to hunt revenge. You thought me a boy, an unfeeling idiot, who could stand by and see his father murdered, and never strike a blow in his defence. Now hear me: may the curse due that murder rest on my soul forever, may disease and premature decay waste my body, and remorse and everlasting despair prey on my spirit, my name be abhorred while I live, and my memory accursed when I die, if I have not my revenge. No human threshold will I cross, with no living being will I hold friendly intercourse, or claim companionship, till my knife drinks his blood. I know him well, I saw his face and figure when he did the murder, and this morning I marked his tracks upon the sand; I will hunt him to his death; he tore off my poor father's scalp,—let him look to his own!" and he ground his teeth fiercely. "Nay, Ham," I replied, "this will never do; a young hunter like you to take to the woods alone; the very beasts will destroy you, to say nothing of the Indians." "Beasts destroy me!—beasts! they shall be my companions, and each one shall learn from me some new and bloody lesson. I'll teach the hungry wolf ferocity; the bear that is robbed of her whelps, I'll teach revenge; with the beasts will I live, and like them will I die, unless I have my revenge." With these wild words Ham caught up his bags, shouldered his rifle, and was gone. I watched him for a moment till he sprang into the woods, and I lost sight of him.

#### [From the Legends of a Log Cabin.]

THE HUNTER'S PERILS.—On the fourth day, about noon, being then about forty miles direct distance from H——, we came upon the trail of a large body of Indians, who had passed there the day before, and were going up river. It was not a war party, as the tracks of women and children were mingled with those of grown men. We followed four or five miles, when, at a soft piece of ground, I caught sight of a foot-mark I knew right well.—'Twas the broad flat foot of the Indian, whom we called Broadfoot. I showed it to Johnson, who agreed that there could be no doubt as to whom it belonged. We traced it along till at the top of a ridge the party separated, Broadfoot and four others taking a course directly out from the river; and the others, principally old men, women, and children, still following up the stream. Here Johnson and I called a halt, and consulted whether we should follow Broadfoot and his gang, or the larger party.—Johnson was for the latter plan, saying, that where there were so many women and children, they must needs move slowly, and we should easily overtake them, and like enough take a scalp or two. I wanted to track Broadfoot still, both because I longed to take the scoundrel's scalp, and because I could not but think we stood the best chance of finding the

boy, by keeping on the trail of the enemy of whom he was in search. Finally, Johnson, gave in, and we followed the smaller, or war party.

Poor Jim grumbled a good deal at what he called my wrong-headedness. "There were twenty or thirty tracks," he said; "they were going slow, and by night we could have overtaken them, and taken a scalp or two at least. Even a squaw's scalp would have been some satisfaction; nay, a child's would have been better than nothing."

"What on earth do you want with a squaw's scalp, much more with a poor popoose's, Jim Johnson?" said I.

"Why, Balt, I don't want a squaw's scalp, nor a popoose's, if I can get a warrior's; but surely half a loaf is better than no bread. Here we have been on a range four days, and have not had a shot at a red skin—man woman, or child—though we all know the woods are full of them. It is too bad; I vow it is a disgrace to the settlement there has not a single scalp been brought into Harmer in a month." Johnson went on grumbling and complaining, but I did not mind him, but kept a sharp eye on the trail. We followed it steadily and pretty rapidly till night-fall; we then camped, lighted our fire, cooked a bit of bear steak, and went quietly to sleep. Next morning we were early on the trail, and followed it steadily till near noon; then a new foot-mark joined it; I gave but one glance, 'twas Mam Cass. The sight of the foot-marks warmed my heart; I gave a glad shout, and followed the trail with renewed energy. I did not lose the chance of bragging over Jim.

"See, Jim, wasn't I right after all? I knew the boy was true bred, the genuine old hunter blood is in him, and for all his book learning it will show itself; you see he is on the right scent now, and my word for it, he will see the game." Just as Johnson began some light and joking reply, I heard the sharp crack, crack, crack—three rifles. Johnson, who was a step or two in front of me, gave one bound right up into the air, and fell dead at my feet. At the same time I felt a numbness in my right leg; I too was hit. I looked up the hill side, five Indians were bounding down at a great rate. There was no time to lose, I ran for life. Luckily the ball had not touched the bone; in a moment they were all after me at full speed. I gave one glance over my shoulder to see how they were coming; only one was very near me, and if I could but escape him, I had no fears for the rest, for on level ground, even with my hurt leg, I could leave any Indian far behind me on a short race. In a minute more I heard another rifle; I glanced behind. The Indian who was nearest me—and he was fearfully near—stood still, groping in the air with his hands for a moment, and then fell. One of his companions had hit the wrong mark; the Indians saw the fatal error, and filled the air with their yells. I ran on; making for a creek we had passed in the early part of the day, I soon found that no one was after me, but there was little safety in that; the savages could not look at my trail without finding that I was wounded, and this would encourage them to hunt me down. My wound, too, began to be very painful, and I felt that it would be impossible for me to reach the creek without a rest; yet I scarce dared stop, till at last I came to a sycamore tree, which was hollowed out by rot. Here I determined to make my resting place; in the upper part of this hollow I can probably remain concealed, or, if discovered, sell my life dearly. The only opening to this tree was about four feet from the ground, scarce large enough to permit a man to crawl in; once in, the space would easily permit a dozen men to stand at ease. I crept in and began to take a regular survey of my little fortress. I found there were several small holes, the size of a dollar, and one, near twenty feet from the ground, where a limb had broken off, which was larger than that at which I had entered. Here I rested for some time, and having plucked some leaves as I went through the woods, I now chewed and applied them to my wound with great relief. You may well suppose I kept a good look out all the while, lest the savages should come on me unawares. I had watched there for more than an hour, when I caught sight of them following my trail. The first was a chief, a large, tall, powerful fellow, with a feather in his high tuft of hair, medals on his breast, and Wampum beads hanging in strings from his dress. At his belt hung a fresh scalp, which I knew could only be poor Johnson's. He was followed, in Indian file, by six others; slowly and cautiously they advanced on the trail, till they came within fifty feet of the tree.

Here they halted, and I could have picked one off very easily, but I thought I would wait and see what plan they would adopt. After some whispering and gesticulating, two of the Indians were detached, and made a circuit round the tree, apparently to discover whether the trail led beyond it. When they had completed their round and joined their companions, they held another long talk; finally, three raised their rifles and fired at the hole in the tree. One of the balls only entered the hole, but as I took good care to be out of range, it did no harm. Again they held a talk; they seemed irresolute what to do, and I began to think they would leave me, but such was no part of their intention. I saw them again raising their rifles for a shot, when a plan entered my head by which I hoped to get two lives at least; so when they fired I gave a furious scream, as though wounded, and then began to groan; at first very loud, and finally slowly and softly, as though just dead. The stratagem had its effect. At the first scream the Indians gave a shout of triumph, and then, as they heard the groans, they advanced towards the tree. Still their natural craft did not entirely desert them, for they crept on very slowly, stopping every now and then, and listening with eager attention. Finally, the head man stood beside the opening, he poked in his rifle, moving it about; then he thrust in his head; and just as he was fairly in, I fired, and blew the top of his head all off. He fell forward, his body blocking up the hole. In an instant I sprang on him, wrested the rifle from his dying grasp, pointed it from one of the small loop holes, fired, and another Indian was dead beside his Chief; the others gave one yell of despair, and took to trees. There was now, for a while, a cessation of our warfare. The Indians, each hid behind some neighboring tree, were concealed from me, and did not seem very much inclined to leave their covert. In the mean time I was busy rifling the dead Chief. The gun I had taken, and which had already done me such good service, I found, on looking at it, was Johnson's; the savage had a well filled bullet pouch and a horn of powder; the ammunition was of immense importance to me, as I had not above a dozen charges left, and there was no telling how long this fight might last. I also got a large bag of parched corn, and a small (pity it was so very small) flask of whiskey. Having secured these valuable spoils, I resumed my quiet watch of the savages.

The sun was near setting, when I saw them, at a signal, fly each from his tree, and take refuge behind a small rise in the ground about twenty or thirty yards from my tree. Here they were out of my sight, and what was worse, they could creep round, and approach on either side without my knowing where to look for them. "This," thought I, "will never do; I'll see if I can't break up the council they are holding, or at least get an idea of what they are about." I began to climb the sides of the tree. As the rot had eaten irregularly, it left a good many knots and knobs; so that, notwithstanding my lame leg, I made out finally to reach the upper hole. Cautiously I poked my head out, and was rejoiced to find that I could command a full view of my enemies. There lay the whole five, their heads together, talking and pointing, evidently hatching some plan for my destruction. Having satisfied myself that from the top of my fort I could hit one of the savages, I descended again, and fastening one end of my belt to my side, and tying the two rifles, ready loaded, to the other, I ascended again. Just as I caught sight of the savages, two of them made off, rolling and creeping along till they were out of range of my rifle; then they took to the woods, and I saw no more of them. Here was another hint to me to be in haste, as the varmin were sending for reinforcements. Slowly and carefully I pushed out my rifles, and resting one in the crotch of the tree, I took deliberate aim at the nearest Indian. He lay flat on the ground, and my ball hit the very centre of his head. His companions sprang on their feet, gazing all around, evidently at a loss to tell whence the blow came. As they stood there I could take perfect aim, and in a moment another fell, with a ball through his body. The second shot roused the remaining Indian to the necessity of putting shelter between him and me. He sprang behind a tree. Here he remained a long time, till finding he was not likely to move, and knowing that their reinforcement could not be far distant, I determined to be off. I went to work with my tomahawk, cutting a hole in the tree opposite to where he lay, and in half an hour's time I could creep out. I then hid Johnson's rifle,

took my own in hand, and crept softly out. Taking advantage of the ground, I was soon out of sight of the Indian; then I sprang to my feet, and made towards the creek with my best speed. I walked more than an hour undisturbed, and began to indulge the hope of reaching the creek without further danger. I had gained the top of the last hill, and the creek lay in the valley below; I paused for a moment, and looking back, I saw four stout Indians on the opposite hill, not more than a mile behind me. They must have seen me at the same moment, for their loud war-whoop rang through the woods. I did not wait for another look at them, but made for the creek. I gained the bank, plunged into the stream. Oh! how pleasant was that cool water to my parched skin and burning wound. I swam with the current, which was pretty rapid, till at a turn in the stream I saw a large raft of drift wood. I struggled towards it, and dived, came up between two of the largest logs. They lay so close together, that I could barely get my eyes, nose, and chin, out of the water; and as the logs touched a few inches above my face, I was in nearly total darkness. Here I lay, half dead with fatigue and pain, waiting the coming of the savages. I soon heard by their shouts that they were near—were descending the stream. One of them came on the raft; he stood for a moment on the log that concealed me; his weight pressing my head under water—had he remained many minutes, I must have perished. He moved onwards, however, and then, like an old otter, I poked my nose out of the water to blow. For near an hour I heard their shouts near the raft, then they began to grow more and more faint, and finally died away. I waited some time, lest some straggler might have remained behind. At last, hearing nothing of them, and being nearly exhausted, I left my hiding place, and swam into the open stream. It was quite dark; I was wet, hungry, and lame; still I dared not rest, there was no hope of safety but in instant flight. By hard tugging I detached a large log from the raft, and drew it into the middle of the stream, then laying myself at full length upon it, I began to float down the stream.

PROFESSOR SILLIMAN'S APPEAL IN BEHALF OF THE AMERICAN JOURNAL OF SCIENCE.—We noticed some months ago this appeal, which went to show, that unless more liberal support were extended to the only American scientific Journal, it was in danger of perishing. See how a British periodical takes it up.

[From English's (British) Mining Review for July.] AMERICAN JOURNAL OF SCIENCE, Vol. 28, Rich. —"We are induced to notice this volume, which our want of space would have otherwise compelled us to defer until a future opportunity, from the circumstance of its containing an Address to the friends of science and knowledge by the Editor, from which we are given to understand that the patronage bestowed on the work is insufficient for its support.

The talents of Professor Silliman, and the character of the American Journal, are too highly appreciated on this side the Atlantic to need our testimony, and it is with feelings of deep regret and astonishment we learn, that a nation professing a regard for literature and philosophy, should have been so indifferent to the success of a periodical, which has materially conduced to raise America to the rank it now holds in the scientific world.

The appeal is addressed to his own countrymen; but Professor Silliman is entitled in the highest degree to be considered as a Citizen of the World, there being few parts to which his reputation has not extended, and if by quoting the following extract from his address we can promote his views, it will afford us sincere gratification.

Then follows the Address of Prof. S. alluded to above.

THE SUBMARINE VESSEL.—The experiment with this machine took place at St. Ouen, as proposed. The vessel was repeatedly sunk to the depth of ten or twelve feet, and re-appeared on the surface at different points. M. Goude de Laincourt got into it, and remained there a quarter of an hour. He stated that he did not experience the least difficulty of respiration during his voyage under water. An official report upon the subject is about to be submitted to the French Government.—[Athenaeum.]

## SUMMARY.

**PORT OF LIVERPOOL.**—The immense intercourse between the ports of the United States and that of Liverpool, will dispense us from the necessity of any apology for inserting the annexed article, detailing officially, some important improvements as to the lights and buoys off that port.

[From the *Nautical Magazine*, for September.]  
IMPROVEMENTS IN THE LIGHTS, BUOYS, &c. AT THE ENTRANCE OF THE PORT OF LIVERPOOL.

Compass Bearings.

Dock Office, Liverpool, June 30th, 1835.

The Trustees of the Liverpool Docks and Harbor hereby give notice, that, in accordance with the recent survey of Capt. Denham, R. N. the following improvements in lighting, beaconing, and buoying, of the approach to the port, will be in operation on and after the night of the first of August next, viz:

**Point Lynas Light.**—This light, hitherto so situated as to preclude seeing it seaward, and merely shown by a single reflector upon the long-shore aspects, will be advanced to the pitch of the point, and exhibited from a castellated building (with white basement) recently erected thereon, with a powerful steady light, of the natural color, produced by 13 argand lamps and reflectors, ranging over 211 degrees of the northern and south-eastern horizon, at an elevation of 128 feet above half tide level, rendering it visible, in clear weather 6 to 7 leagues from a ship's deck; or within 1 league of taking up the N.W. light ship of Liverpool. This light is so masked for local inshore effect, as to obscure itself when brought eastward of S.E. 1-4 E. which clears the *Middle House* 1-4 of a mile, or northward of N. by W. which clears the *Dallas Rocks* 1-4 of a mile, and indicating when you ought to tack out of *Red Wharf Bay*.

The *Formby Floating Light* will, on and after the same night, show its natural color with increased power, in lieu of the red light hitherto exhibited.

The *Rock Lighthouse* will exhibit a black ball above its balcony, whilst 12 feet water remains in the "Rock Gut" by day; and a steady light (from a lower chamber in the western aspect) will indicate the same by night.

A *Floating Beacon* will be moored in the place of the present fairway buoy, at the new channel entrance; presenting a black conical figure, bearing this inscription: "To New Channel E. 3-4 S." and surmounted by a large black ball, elevated 23 feet, with a self-acting Bell.

**New Channel Land Mark.**—In order to render the line of leading objects into the New Channel more available in hozy weather, or accidental absence of the light vessel; a dark bulky frame-work has been erected on the high-water shore of *Formby*, in line of the light-vessel and light-house.

**Hoyle Lake Lighthouses.**—These buildings, in order to distinguish them more effectually from the neighboring houses, will henceforth be painted white.

**Dove Beacons.**—Two beacons will appear on *Dove Point*, instead of one, affording a leading mark when brought in line upon the bearing of S. by E. for passing between the *Dove Spit* and *East Hoyle*, in reference to the eastern entrance from *Hoyle Lake*.

The buoys will henceforth be distinguished by the initial of the channel or bank they respectively occupy, i. e. F. *Formby*, C. *Crosby*, N. *New Channel*, H. F. *Half-tide Swatchway*, H. *Horse Channel*, H. E. *Helbre Swatch*, R. *Rock Channel*, L. *Lake (Hoyle Lake)* B. *Beggar's Patch*, K. *Knowl*, (Newcome.) They will likewise be numbered in rotation. No. 1 always denoting the outer, or seaward buoy of the channel its letter indicates; and the turning point, or elbow, of each channel will be distinguished by a perch buoy; bearing in mind that red buoys lie on the starboard hand, and black upon the larboard, when running in.

**Additional Buoys.**—Eighteen additional buoys will be laid down by the above date (making 56 in all) and thus disposed. One (red) and one (black) on each side of the New Channel, between the present buoys. One (red) on the eastern edge of *Jordan Bank*, between the present buoys. One (black) on the edge of *Formby Bank*, next northward of *Crosby* buoy. Two (black) on the Low-water edge of *Bootle sands*. One (red) on edge of *Rip-rap*. One (red) on edge of *Mockbeggar Wharf*, between the *Dove Spit* of *West Wharf* Buoy. One (black and white) on west end of *Beggar's Patch*. Two (red) on east edge of *East*

*Hoyle Bank*, within the present buoys. Two (red and white) on the west side of *Helbre Swatch*. Two (black) on the east side of ditto. One (white with black stripe) showing the fairway of *Half-tide Swatchway*, 1 mile westward of *Formby* fairway buoy. One (red) on the end of *Hoyle*, in *Hoyle Lake*, abreast of the church. And a black (Nun) buoy, (marked K. 1.) upon that part of a shoal now called *Newcome Knowl*, which has lately grown up so as to have but 14 feet water upon it at low water springs. This buoy bears from the N. W. light-ship E. 1-2 S. 2 1-2 miles; and from the New Channel floating beacon S. S. W. 1-2 W. 2 miles.

The whole of the foregoing will be clearly shown and explained in the forthcoming completed edition of Capt. Denham's Survey, of which the dock trustees published an exact chart last year, under sanction of the Right Hon. the Lords Commissioners of Admiralty.

By order of the Liverpool Dock Committee,  
H. M. DENHAM.

Marine Surveyor to the Dock Trustees.

N. B.—The navigation of the port will be further assisted by an arrangement which will enable the light-vessels to act as telegraphs, whereby ships' numbers or casualties will be more readily transferred to the town.

## "ALL BAGGAGE AT THE RISK OF THE OWNERS."

—It has lately become very common for incorporated rail road and steam boat companies to advertise conspicuously, in the above words, in order to screen themselves from liability, in case of the loss or miscarriage of any baggage entrusted to their care. To test the legality in regard to the operation of such an advertisement, two suits have recently been instituted against the Camden and Amboy Rail Road Company, in both of which full and ample damages were given for the plaintiffs. An action was tried on Thursday of last week, in the Superior Court, before Chief Justice Jones, in which the above company were defendants, and Mr. Ralston Belknap was the plaintiff, for the recovery of a trunk entrusted to their care for transportation to Philadelphia.

It was urged on the part of the defendants, that the missing property had not been left in the care of any of the agents of the company, but was merely placed in the office, while the plaintiff was paying his fare as a passenger; the advertisement announcing that the company were not responsible, &c., was also read in court. On the part of the plaintiff, it was contended that although the defendants did give notice that they refused to be responsible for the loss of property falling into their possession in the regular course of their business operation, under the sanction and by the authority of their charter, yet their edicts were utterly futile and of no avail, and they were liable, both in equity and law, for the loss or destruction, under such circumstances, of any chattels, or goods belonging to other persons. In his charge to the jury the learned judge coincided with the arguments of the plaintiff's counsel, and the jury awarded damages in the sum of three hundred dollars, for the plaintiff. So that, all baggage is not at the owner's risk.—[Mer. Adv.]

**NAVAL.**—The U. S. frigate *Constitution*, Com. Elliott, arrived at Gibraltar, in 23 days passage from New York, officers and crew all well.

The *St. Louis* and *Vandalia* were to sail on a West India cruise from Pensacola about the 10th inst.—[Gazette.]

The ship *Meridian* at Baltimore, on the 15th Sept. lat. 45 53, long 60, passed a New York Pilot Boat, standing east—no doubt the John D. Aymar in pursuit of Mr. Bowen, who sailed in the *Caledonia* on the 1st ult.—[Gazette.]

We learn that the Commissioners appointed to treat with the Western Indians, have returned to Fort Gibson, after having successfully accomplished the object of their mission. A treaty of amity was concluded by them, between the United States and the Cherokees, Creeks, Choctaws, Osages, Senecas and Quapaws. Nothing occurred to interrupt the general harmony, and all parties separated with good feelings.

There is no doubt but that this arrangement will be productive of happy effects. It is the first time these wild Indians have met upon such an occasion. They have heretofore kept the frontier in a state of alarm, and have attacked with equal impartiality, citizens of the U. States and the Indians.

We learn that there are three families, or divisions, of these Indians, who inhabit the great

Western prairie. These are the Camanches, who are the most numerous, but who have no fixed or permanent villages, and follow the herds of buffaloes, with their moveable lodges, sometimes North and sometimes South of Red River.

The *Wichetas*, consisting of several bands, some living North and others South of Red River. Those North are the *Towecash* and *Wachos*.—They have fixed villages, and raise corn and vegetables.

The *Kioways* are the third family.—They have no fixed residences, but wander from the Cross Timbers on the Arkansas, Canadian and Red River, to the Rocky Mountains; and are sometimes, though not often, found south of the Red River. As many different terms have been used in designating these Indians, we have thought it would be acceptable to remove the confusion occasioned by an imperfect knowledge of them, and give their divisions as reported by the Commissioners.

From some cause not known, the *Kioways* did not attend; but we learn that a deputation of their Chiefs was expected at Fort Gibson, to give their concurrence to the arrangement made.

We further learn, that the Commissioners have very judiciously inserted a provision in the treaty, inculcating the desire of the United States upon the Indians, that they remain at peace with Mexico.—[Globe.]

We were told a few days since in Washington, that a gentleman of Paris had left, by his will, about ONE MILLION of dollars, for the purpose of endowing a National University in that city. We learned also that the constituted authorities of the city had received official information of the fact, with a copy of the will. The *Alexandria Gazette* alludes to the rumor. Could not the National Intelligencer satisfy public curiosity on the subject?—[Fredericksburg Arena.]

We have the pleasure to inform our friend of the Arena, that we believe his intelligence is substantially correct. We learn that information has been received by the government, that such a bequest was made by some English gentleman of fortune, and that the sum of 200,000 pounds sterling will in all probability inure to this city for the erection and endowment of a University. The money, we understand, was bequeathed in the first instance to the only son of the testator, but in case of his death without heir, to go to the City of Washington for the purpose above stated. That contingency occurred, and the princely legacy accrues to the city. It is probable that the President will communicate the fact to Congress early in the next session.—[Nat. Intel.]

The *Intelligencer* of Saturday also contains the following paragraph respecting the legacy: We understand that it would be more accurate to say that the English legacy of 200,000, was bequeathed "to the United States, for the purpose of establishing an University at the Seat of Government for the promotion of the arts and sciences." The money, we are informed, is in the hands of the Lord Chancellor of England, ready to be paid over conformably to the will, which fact he has communicated to our government, with a copy of the will.

**SALE OF STATE LANDS AT OSWEGO.**—On the 15th inst., the Surveyor General sold, at Oswego, the piece of land on the west side of the river, embracing the site of the old fort, and also a block on the west side of First street. The land between First street and the river, consisting of about three acres, sold for \$108,175. The block between First and Second streets was divided into 12 lots, 66 by 100 feet each, and the whole sold for \$46,460—total amount of sales, \$154,635.—[Argus.]

**CANAL TOLLS.**—The tolls collected on the New York canals for the first week in October, amount to the sum of \$60,034 93. The whole sum received for tolls from the opening of navigation to the 7th of October, has been \$1,154,000.—[Argus.]

**ACCIDENT.**—Yesterday as the agent of a train of cars, on the Boston and Providence Railroad, was imprudently standing on the outside guard of one of the cars, leaning over too far, came in contact with the railing of a bridge, over which the road passes, with such violence as to cause his instant death.

[From the *Oswego (N. Y.) Observer*.]

**CENSUS.**—Agreeably to the return of J. H. Wright, Marshall, the census of the town of New Haven, is as follows:

Total number of inhabitants, 1651. Males 795. Females 706.

[From the Chicago American.]

Of the numberless letters received at the Post Office, of inquiry relative to this town and country, one has been handed us to answer, that the information here given, may be also satisfactory to other strangers who are making similar inquiries, as well as to the writer of the following, who dates from Tuscaloosa, Alabama. Few intelligent persons have resided here many months, without being severely taxed with letters of this description. Jonathan, in particular, draws largely upon their liberality—is minute in his inquiries—and most unconscionably tedious.

The writer asks,

1. "What is nearly the amount of the population of Chicago at the present time?"

Four thousand. Three years ago it was perhaps three hundred. Two years ago, six or eight hundred. One year, \$000. And now, as above, about 4000.

2. "How long are goods generally getting from the Atlantic cities to your's?"

They are now from twenty to thirty days from the city of New York. The commerce of this important metropolis, will soon induce the proprietors of lines upon the Lakes to provide some other facilities than those now possessed for expediting the passage of vessels, such as steamboats stationed on some parts of the route for towing them through difficult channels, &c. Circumstances will render expedient the adoption of such conveniences as will place the average time of transportation from New York at less than twenty days.

3. "How great a portion of the year is your navigation closed up by ice?"

The Lakes are generally ready for navigation about the first or middle of April, although vessels did not sail from Buffalo last Spring (which port is closed a month later, generally, than others on the Lakes) until the 15th of May. Navigation usually closes about the last of November or first of December.

4. "How is the climate of your town compared with, say, Albany, New York?"

The latitude of Chicago is the same with West Point, (N. Y.) The climate, as is the case with the West generally, is milder than that of the East in the same latitude. The cold season is shorter, and the autumn more serene and less rainy. The sky is purer, and the twilights long and beautiful.

5. "What is your highest temperature and your lowest; and how low did the thermometer sink during your coldest weather in the last cold winter?"

The highest temperature which we have known since our residence here, was 94 degrees. The winter before last, it sunk to 28 degrees below zero. Last winter to 22 degrees, while in N. York in sunk to 34 degrees. We have never seen a series of observations by the Thermometer, by which we might learn the mean temperature here.

6. "How is the health of your town and the region of country round about?"

Chicago is doubtless the most healthy town of any in the State of Illinois. In the months of August and September fevers are frequent, such as are common to the West generally; chiefly bilious and fever and ague. In the winter and spring there are some cases of pleurisy. Consumptions are not indigenous in Illinois. The country at present is more subject to diseases than the town.

7. "How many schools have you, and of what description?"

We have three public schools, besides a private school for ladies, the former of which are supported by the interest of the town fund arising from the avails of the sixteenth section in this township, which fund amounts to \$40,000 bearing interest at 10 per cent. per annum. In respect to means for the support of education, Chicago is more bountifully supplied than any town or city in the west, or in the nation.

8. "How many churches, and of what denomination?"

There are five, the Episcopal, Presbyterian, Baptist, Methodist, and Roman Catholic.

The above are some of the inquiries which are reiterated by almost every mail, and it is thought an answer given in a public manner, might satisfy many such inquirers, and be of general service.

We learn by the Chicago American, that good were received in that place, twenty days from New York, by the brig Indiana, of the Eagle line, and twenty-one days by the schooner Agnes Barton—

These we believe to be the quickest trips which have been made from New York, via the Erie Canal and the Lakes. The distance is over two thousand miles, and the passage would average about one hundred per day, including the time of transshipment at Buffalo, and other stoppages on the Lake.

The schooner Grecian, Captain Stubbs, of Bucksport, arrived at that place on Friday last, with a few goods from the ship Eagle, stranded at Sable Island. The Grecian lost an anchor, sprung some of her spars, and drove over the shoal at the west end of the Island. A small schooner fitted out at Orland, Maine, to go to the wreck, was lost near Goldsborough, in a gale last Tuesday; five persons drowned, one saved.

About 30,000 dollars in value of dry goods, sent from the Eagle to Bucksport and Castine, the chief part of which was advertised to be sold this day, at Bucksport, are coming to this port under a new arrangement, which will afford the owners an opportunity of identifying their goods.

**BITUMINOUS COAL IN MASSACHUSETTS.**—The Taunton Gazette states on the authority of a letter from Mansfield, that a bed of bituminous coal has been discovered, on the land of Mr. Alfred Hadden in that town, about half a mile from the Providence Railroad. It was discovered in digging a well, ten feet below the surface of the ground, the vein being more than six feet in depth. It is added that a blacksmith in the neighborhood has made trial of the coal, and pronounces its quality to be good.

**PITTSBURG, Oct. 9.**—THE RIVER.—We walked down this morning to look at the river, which we found in excellent condition, and saw that our business men were improving the opportunity afforded them. We counted twenty-three steam boats lying along the shore. Nine of these were entirely new—some not quite finished, and some just being finished. Eleven others were engaged either in receiving or discharging cargoes. Among others there were boats for Louisville, Nashville, Florence, St. Louis, and other places.

#### OFFICE BOARD OF HEALTH.

Charleston, 16th Oct., 1835.

The Board of Health deem it expedient, in order to remove any misapprehensions which may exist abroad, in relation to the health of an epidemic. We have been told by eminent physicians of this city, that the cases of yellow fever which have fallen into their practice this season have been more mild in its form than has occurred for many years past. We trust that the rain which has fallen yesterday and to-day, will enable us to announce shortly that our city is free from all disease. Many of our city papers, actuated, no doubt, by good intentions, have been rather premature in inviting strangers back to this city, but we do not think it advisable for some two or three weeks to come.—[New Orleans Union, Oct. 5.]

ROBERT ELFE,

Chairman of Board of Health.

**HEALTH OF THE CITY.**—Within a few weeks past we have had many cases of fever, but not sufficient to cause alarm, or to amount to an epidemic. We have been told by eminent physicians of this city, that the cases of yellow fever which have fallen into their practice this season have been more mild in its form than has occurred for many years past. We trust that the rain which has fallen yesterday and to-day, will enable us to announce shortly that our city is free from all disease. Many of our city papers, actuated, no doubt, by good intentions, have been rather premature in inviting strangers back to this city, but we do not think it advisable for some two or three weeks to come.—[New Orleans Union, Oct. 5.]

[From the Newark Daily Advertiser.]

#### INTemperance, GAMBLING, FIRE AND DEATH!

—A horrible climax, but as natural as the connection of cause and effect. A shocking illustration occurred yesterday. Between 12 and 1 o'clock last night, the town was alarmed by the cry of fire, proceeding from two dwelling houses in Quarry street, occupied by several Irish families. So far as we have been able to learn, the fire probably originated in carelessness, resulting from gross intemperance and rioting among the occupants. About nine o'clock in the evening, (it being Sunday,) one of the Constables, with a citizen, in pursuit of an Irishman who escaped from the Bergen County Jail on Saturday night, entered one of the houses unexpectedly, and surprised a party round a table playing cards! Other circumstances lead to the belief that the house had been during the day a scene of carousal and drunkenness.

The fire originated in the garret, where it was probably communicated to clothes hanging to dry, by a drunken woman who had been up several

times during the evening and night with a light.—The boys asleep in the garret were waked by the smoke, and communicated the fact to the miserable inmates below, some of whom were still over their cups. One of the number, we hear, was so beastly drunk, that it was necessary to drag him out in order to save his life. Two young women, we are told, were found in very little better condition.

Another female—the wife of Patrick Doyle, a tenant—it appears, met the just retribution of the loathsome habits of the house. Instead of running out when the alarm was communicated, she went up stairs, and probably becoming bewildered in the smoke, perished in the flames! Such are some of the fruits of an Irish wake in Newark.

**MARK WINSLOW.**—This man who has grown gray in crime, was lately convicted at Boston of having in his possession a large amount of counterfeit bank bills of different denominations, some of which were of the banks of this State. He was sentenced to the State prison in Charlestown for the term of his natural life. On Thursday morning, he committed suicide by opening the jugular vein, in the Leverett street jail. That forenoon he was to have been conveyed to the State prison. The Boston papers of yesterday inform us that he left in his cell the following letter to his wife. How true it is, that "the way of the transgressor is hard."

My dear wife—(thou best of women)—most deeply do I regret and repent that I had not lived agreeably to your good and sound advice. If I had I might now have been enjoying your good society with the rest of my friends. Oh! how I could be hurried on, and unbeknown to you, I cannot conceive—but, alas! so it is. I freely forgive all my enemies, as I hope to be forgiven, and I hope we may meet in another and a better world.

From your affectionate and loving husband,

MARK WINSLOW.

N. B.—Farewell all my living friends.

Thursday morning, Oct. 15th, 1835. M. W.

**A PANTHER.**—On Saturday last, Leonard North the son of A. North, Esq. of Champlain, went fit to the woods in pursuit of deer. His dogs soon started one which the young man immediately shot. He directly found his dogs on another track, and from their noise and running, he soon discovered that they had started some uncommon game. He had gone but a short distance from the spot where he first killed the deer, when he espied a large panther in a tree, looking most wishfully first at the hunter and then at his dogs—wagging his tail ready to leap down upon his pursuers.—North lost no time to retrace his steps, and coolly and deliberately climbed up into a small tree with his gun in his hand, and taking sight at the head of this furious beast, put a ball through his head, entering under one of his eyes and coming out upon the neck near the shoulder.

The panther came down the tree and attempted to escape—the dogs pursued him so close that he took refuge in another tree. The young man again discharged his gun at the foe, and brought him to the ground badly wounded, still the panther kept the dogs at bay, nor was he so far disabled as to render it safe to come near him until a third fire from North had tamed his ferocity, so that his dogs could prevent his escape. He was killed and taken out of the woods, and weighed one hundred and forty two pounds—one of the largest sized panthers ever killed in this country.—[Plattsburg Whig.]

#### The Statuette.

She lieth here, in unweild loveliness,  
Yet nothing naked; for the perfect charm  
Of beauty and of symmetry doth dress  
Her figure in a raiment bright and warm—  
A garb most spiritual, which doth repress  
The sensual eye of sense: with one fair arm  
She leaneth on a pillow, softly sinking,  
And her sweet face upturns to some voluptuous thinking.  
The other, bending with a rainbow grace,  
Plays with the hindmost tresses of her hair,  
Over her shoulder. Oh! that love-tuned face!  
It beams a passionate pleasure on the air;  
And makes us crave some silent dwelling-place,  
To gaze and live on it for ever there!  
A love-thought stirs her mouth; and o'er her eyes  
Appears the memory of a thousand sighs.  
Her rich-swelled bosom, toward her white couch turn'd;  
Spell takes the eyelids; and her limbs, extended  
In animate perfection, are discern'd,  
In all the harmony of structure blended,  
Pressing each other's beauty: there hath burn'd  
A dream of fire about her, which hath call'd;  
And now she looks reposing from that vision,  
And from love's dream to love inviting soft transition.

[From the Boston Token and Atlantic Souvenir for 1884.]

### The Bride.—By Mrs. Sigourney.

I came, but she was gone.  
There lay her loss,  
Just as she sought it last, at the soft hour  
Of evening twilight, when the woodbine cups  
Filling with deeper fragrance, fondly pressed  
Through the rain's caressment, uttering tender thanks  
To her who trailed them. On her favorite seat  
Still lay her work box open, and the book  
That last she read, and careless near its page  
A note, whose cover her slight pen had traced  
With lines unconscious, while her lover spoke  
That dialect which brings forgetfulness  
Of all beside. It was the pleasant home  
Where from her childhood she had been the star  
Of hope and joy.

I came, and she was gone.  
But this I know, for I remember'd well

Even triflers seek  
How strong and beautiful is woman's love,  
That, taking in its hand the joys of home,  
The tenderest melodies of tuneful years,  
Yea, and its own life also, lays them all  
Mock and unblenching on a mortal's breast  
Smothering naught, save that unspoken hope  
Which hath its root in God.

Mock not with mirth  
A scene like this—ye laughter-loving ones—  
Hence with the hackney'd jest. The dower's host—  
What doth it here?

Joy, serious and sublime,  
Such as doth nerve the energies of prayer,  
Should swell the bosom, when a maiden's hand  
Presses from its young flower gathering, girlish on  
That harness, which the minister of death  
Alone unlooseth—and whose power doth aid  
To pierce the journey of the soul to Heaven.

### AUBURN AND SYRACUSE RAILROAD.

#### NOTICE TO CONTRACTORS.

Sealed Proposals will be received until the 15th day of October next, at noon, by the undersigned, Chief Engineer and Agent of the Auburn and Syracuse Railroad Company, for the Grading, Masonry, and Bridges on said Road. Individuals desiring to contract for the execution of the whole or any part of the work, will be furnished on application at the Office of the Company in Auburn, with blank forms of proposals, and printed specifications.

The contract will be formed in the usual manner—a special price being stated for each item of work, which price is to include the cost of material and labor required in rendering the work complete.

The proposals to be accompanied with the names of sureties, and where the parties are unknown to the undersigned or resident Engineers, the usual certificates of character and solvency will be required.

Individuals who have been employed on other works, must furnish satisfactory recommendations from the Engineer or Superintendents of the same. A rigid adherence to the conditions of each contract will in all cases be required.

It is desired that all the work in each section, including Grading, Curves, and Bridges, should be embraced in the same contract, and it is requested that the proposals be made accordingly.

The plans of the different structures will be ready for examination at the Office aforesaid, by the 1st day of October next.

Chief Engineer & Agent A. & S. R. R. Company.  
Auburn, Aug. 24, 1883. 37-4150

### NEW-ORLEANS AND NASHVILLE RAILROAD.

#### NOTICE TO CONTRACTORS.

The New-Orleans and Nashville Railroad Company having decided to place under contract the first fifty miles of the Road, on the 15th day of December next, Proposals will be received at their Office, in the City of New-Orleans, from the 15th of November to the 15th day of December next, for the Grading and Bridging of the same.

The Superintending Engineer, R. S. Smith, will be upon the ground to give every explanation relative to the manner of making Proposals, and such other information as may be required.

Of persons not personally known to the Engineer, there will be required certificates of character and qualifications.

This part of the road, extending along the shore of Lake Pontchartrain, is perfectly healthy throughout, and being the commencement of the most extensive work in the world, it cannot fail to be of great importance to Contractors to identify themselves with the work at its commencement, so those who are known to the Company as responsible and efficient will certainly be preferred to strangers during the future progress of the road.

The country through which the line passes is generally high plain ridge, and perfectly healthy.

H. J. BANNEY,  
Chief Engineer N. O. & N. Railroad.  
Engineer Office, N. O. & N. Railroad,  
Aug. 24, 1883. 37-4150

### BOSTON AND NORWICH RAILROAD.

NOTICE TO CONTRACTORS.—Sealed Proposals will be received at the office of the Boston, Norwich and New London Railroad Company, in the City of Norwich, until the 14th of November next, for the Grading and Masonry of the first division of their Road, extending from Norwich to Jewett city, a distance of nine miles.

The road will be divided into sections of various lengths, to suit contractors, and will be ready for examination by the 8th of November.

Plans and profiles will be exhibited, and the line pointed out, on application at the Engineer's office, in Norwich.

The work to be constructed without the use of splinted timbers.

Contractors will be required to present with their proposals the usual certificates of character and ability to perform the work.

J. F. KIRKWOOD, } Engineers.  
JAMES LAURIE, }  
Norwich, Conn., Oct. 14, 1883. 025 dms

### VALUABLE FARM.

FOR SALE, one of the best Farms in the county, containing 200 acres; 60 acres of which are the finest meadow land, annually overflowed. In point of advantage, beauty and healthfulness of situation, the place is not exceeded, and it may be permanently leased for a rent equal to at least seven per cent. on the price demanded. Inquire, (if by mail, post paid,) of D. K. Minor, Esq., office of the American, New York.

### TO TUNNEL CONTRACTORS.

Proposals will be received by mail, or otherwise, for excavating a Tunnel on the summit of the Sandy and Beaver Canal. The Tunnel is 900 yards long, the material to be removed is a soft sandstone rock, the highest part of the ridge through which it passes is about 50 feet above the top of the Tunnel. As the deep cuts at the termination are not excavated, most of the material will have to be removed through shafts. Proposals must be accompanied with good recommendations, as to skill and competency.

E. H. GILL,  
Engineer.  
New-Lisbon, Ohio, Sept. 17, 1883. 38-4

### TO TUNNEL MINERS, DRILLERS, &c.

Wanted, immediately, 40 Tunnel Miners, (Cavalier Mt) more will be preferred; 50 Drillers, 50 Laborers, and two experienced Mine Blacksmiths, on the New York and Harlem Railroad, about five miles from the City. Liberal wages will be given, and cash payments made every first night. Apply at Mr. POWELL'S, St. John's Hall, Frankfort street, New York.

JOHN BUTLER, Contractor.  
The Albany Argus, Philadelphia U. S. Gazette and Pennsylvania, will please copy this, and send their bills to the Railroad Company, 14 Wall street, New-York. 33-4

### RAILROAD IRON.

200 tons of Railroad Iron of the T pattern, just imported and for sale by HOWLAND & ASPINWALL,  
400 10 54 South street.

### AMES' CELEBRATED SHOVELS, SPADES, &c.

300 dozens Ames' back-strap and plain Shovels,  
75 do do round pointed do  
150 do do cast steel Shovels and Spades,  
100 do do Bucket Shovels and Spades,  
150 do do steel plated Spades.

Together with Pick Axes, Churn Drills, and Crow Bars, steel pointed, made from Salisbury refined iron. For sale by his Agents,  
WITHERELL, AMES & CO.  
3 Liberty street, New-York.  
BACKUS, AMES & CO.  
5 State street, Albany.  
34-77

### RAILROAD IRON WORK.

Of all kinds, made to order by GOODWIN, CLARK & CO., Paterson, New-Jersey.

CAR WHEELS, BOXES, AXLES, and CAR SPRINGS, made and fitted complete, at short notice, and fair prices.

Orders addressed to them at Paterson, N. J., or 24 Broad street, N. Y., will meet with immediate attention.  
Paterson, Aug. 19, 1883. 34-17

### RAILROAD CASTINGS.

MANY & WARD, Proprietors of the Albany Eagle Air Furnace and Machine Shop, will make to order car wheels, chairs and knees, and every other description of castings required for railroads.

Paterson, N. Y., will meet with immediate attention.  
Paterson, Aug. 19, 1883. 34-17

### PATENT HAMMERED SHIP, BOAT, AND RAILROAD SPIKES.

For Railroad Spikes of every description required, made at the Albany Spike Factory.

Spikes made at the above Factory are recommended to the public as superior to any thing of the kind now in use. Ship and Boat Spikes made full size under the hand, so as not to admit water.

Orders may be addressed to Messrs. ERASTUS CORNING & CO., Albany, or to THOMASTURNER, at the Factory, Troy, N. Y. sept. 18-17

### STEPHENSON.

Builder of a superior style of Passenger Cars for Railroads.  
No. 264 Elizabeth street, near Blackwell street, New-York.

For RAILROAD COMPANIES would do well to examine these Cars, a specimen of which may be seen on that part of the New-York and Harlem Railroad now in operation. 38-4

### RAILROAD CAR WHEELS AND BOXES AND OTHER RAILROAD CASTINGS.

For Ames' AXLES furnished and fitted to wheels complete at the Jefferson Cotton and Wool Machine Factory and Foundry, Paterson, N. J. All orders addressed to the subscribers at Paterson, or 90 Wall street, New-York, will be promptly attended to.

Also, CAR SPRINGS.  
Also, Flange Tires turned complete.  
J. ROERS, KETCHUM & GROSVENOR

### RAILWAY IRON.

200 tons of 1 inch by 1 inch, Flat Bars in lengths of 200 do. 12 do. 14 to 16 feet, corner steel holes, saddle cast at an angle of 35 degrees, with applying plates and nails to suit.

250 do. of Edge Rail of 35 lbs. per yard, with the requisite chairs, keys and pins.

Wrought from Rims of 30, 32, and 35 inches diameter for Wheels of Railway Cars, and of 60 inches diameter for Locomotive wheels.

Also of 24, 26, 28, 30, 32, 34, and 36 inches diameter for Railway Cars and Locomotives of patent iron.

The above will be sold free of duty, to State Governments and Incorporated Governments, and the Drawback taken in part payment.

Models and samples of all the different kinds of Rails, Chairs, Pins, Wedges, Spikes, and Splicing Plates, in use both in this country and Great Britain, will be exhibited to those disposed to examine them. 4150

### PATENT RAILROAD, SHIP AND BOAT SPIKES.

The Troy Iron and Nail Factory keeps constantly for sale a very extensive assortment of Wrought Spikes and Nails, from 2 to 10 inches, manufactured by the subscriber's Patent Machinery, which after five years successful operation and now almost universal use in the United States (as well as England, where the subscriber obtained a Patent,) are found superior to any ever offered in market.

Railroad Companies may be supplied with Spikes having countersink heads suitable to the holes in iron rails, to any amount and on short notice. Almost all the Railroads now in progress in the United States are fastened with Spikes made at the above named factory—for which purpose they are found invaluable, as their admission is more than double any common spikes made by the hammer.

All orders directed to the Agent, Troy, N. Y., will be punctually attended to.

Troy, N. Y. July, 1881.

Spikes are kept for sale, at factory prices, by J. & J. Townsend, Albany, and the principal Iron Merchants in Albany and Troy, J. I. Brewer, 223 Water street, New-York; A. M. Jones, Philadelphia; T. Jaegers, Baltimore, Degrard & Smith, Boston.

Railroad Companies would do well to forward their orders as early as practicable, as the subscriber is desirous of extending the manufacturing as to keep pace with the daily increasing demand for his Spikes.

H. BURDEN.

### SURVEYING AND ENGINEERING INSTRUMENTS.

The subscriber manufactures all kinds of Instruments in his profession, warranted equal, if not superior, in principles of construction and workmanship to any imported or manufactured in the United States; several of which are entirely new among which are an Improved Compass, with a Telescope attached, by which angles can be taken with or without the use of the needle, with perfect accuracy—also a Railroad Goniometer, with two Telescopes—and a Leveling Instrument, with a Goniometer attached, particularly adapted to Railroad purposes.

WM. J. YOUNG,  
Mathematical Instrument Maker,  
No. 9 Dock st., Philadelphia.

The following recommendations are respectfully submitted to Engineers, Surveyors, and others interested.

In reply to the inquiries respecting the Instruments manufactured by them, now in use on the Baltimore and Ohio Railroad, I cheerfully furnish the following information. The whole number of Levels now in possession of the department of construction of the same is seven.

The whole number of the "Improved Compass" is eight. These are all exclusive of the number in the service of the Engineer and Graduation Departments.

Both Levels and Compasses are in good repair. They have in fact needed but little repairs, except from accidents to which all instruments of the kind are liable.

I have found that thy patterns for the Levels and Compasses have been preferred by my assistants generally, to any others in use, and the Improved Compass is superior to any other description of Goniometer that we have yet tried in laying the rails on this Road.

This instrument, more recently improved with a telescope, in place of the vane sight, leaves the engineer scarcely any thing to desire in the formation or convenience of the Compass. It is indeed the most completely adapted to lateral angles of any simple and cheap instrument that I have yet seen, and I cannot but believe it will be preferred to all others now in use for laying of rails—and in fact, when known, I think it will be as highly appreciated for common surveying.

Respectfully thy friend,  
JAMES F. STABLE, Sup't of Construction of Baltimore and Ohio Railroad.

Philadelphia, February, 1882.

Having for the last two years made constant use of Mr. Young's "Patent Improved Compass," I can safely say I believe it to be much superior to any other instrument of the kind, now in use, and as such most cheerfully recommend it to Engineers and Surveyors.

E. H. GILL, Civil Engineer.

Germanstown, February, 1882.

For a year past I have used Instruments made by Mr. W. J. Young, of Philadelphia, in which he has combined the properties of a Theodolite with the common Level.

I consider these Instruments admirably calculated for laying out Railroads, and can recommend them to the notice of Engineers as preferable to any others for that purpose.

## AMERICAN RAILROAD JOURNAL.

NEW-YORK, OCTOBER 31, 1835.

SEE LAST PAGE.

**FIRST ANNUAL REPORT OF THE NEW-YORK AND ERIE RAILROAD COMPANY.**—We are highly gratified to be able to lay before our readers the First Annual Report of this Company. When we take into consideration all the circumstances which have tended to retard the progress of this truly magnificent work, we are only surprised that, with all the perseverance, industry, and ability of those few firm friends, who have stood by it through good, and through evil report, so much progress has been made. It is no small matter, in a work like this, and through a section of country so little known, (and less cared for by many of the more favored,) to make good the first campaign. There are always timid and doubting friends, who often do more injury than open and bold opponents. There are almost always innumerable private interests to be adjusted, and strong prejudices to be overcome, which tend to retard the progress of such works. Yet, notwithstanding all these, and the powerful opposition of the Canal interest, or of many of the inhabitants living in the vicinity of the Canal, the Company is now ready to put 40 miles of the Road under contract, and probably as much more will be ready this fall or early in the spring.

By this Report it will be seen that the obstacles to be surmounted are not of the magnitude which has been apprehended,

and, even by many, asserted. The Company intend first to construct those sections which may be used in connection with other improvements to best advantage, before the whole line is completed, that the investments may, at an early period, become productive. This is undoubtedly the true policy, as it will not only give value to the stock, but also confidence in the early completion and ultimate success of the work.

The Report of the Board of eminent Engineers, which accompanies that of the Board of Directors, must, we feel confident, remove the doubts of all intelligent and reasonable men, as to its entire feasibility, whether they be in favor or opposed to the construction of the work; and it will, most assuredly, stimulate to renewed activity, those of its friends who have never, even in the darkest period of its history, relaxed in their efforts to enlighten those who doubted, and to insure its early completion. We ask for this Report a candid and dispassionate perusal, especially by those who have heretofore given the subject any thing but the light of their countenance, and the aid of their ability.

**THE RAILROAD AND CANAL MAP.**—The period at which the second edition of this Map was to be published, has long since passed; but the work is not yet even ready for the press. We regret exceedingly this delay, as daily calls are made for it. Yet we have not been able to obtain, except in a few instances, from the Engineers and other gentlemen having the charge of the various Railroads, such statements as we desire to publish.

As it is about the season for the publication of the Annual Reports of the different Companies, it is much to be desired that duplicate copies of each Report should be forwarded to us, at the earliest possible period, as well for publication in the Journal, as for the use of the Map; and we would therefore respectfully request our friends,

on each Railroad and Canal, who have not already furnished a description of the work under their care, to forward such a description as will give a correct idea of the work as it now is, and also as it is designed to be when completed. We ask this precise information not only for our own use, but also for the use of others; and especially for the use of gentlemen abroad, who look with much interest to this country for improvements in the construction of Railroads, as will be seen by the annexed extract of a letter from a gentleman at Leipzig.

“Leipzig, 26 Aug., 1835.

“The writer of these lines being a member of the Board of Directors of the Leipzig and Dresden Railway Company, feels much interested to know what is going forward with you in this line of undertaking, and would thank you very much for gathering and forwarding the new publications which appear in your country in relation to this subject; (the Railroad Journal is in our possession already.) A few days ago, we have been told that one of your Companies (the Boston and Providence, or the Baltimore and Ohio) had published a Report, like those of the Manchester and Liverpool Company, stating the receipts, expenses, &c., and it would be highly interesting to us to have it. If you have an opportunity to procure it, or any other statements of this nature, you would highly oblige us.”

We shall be much gratified to be the medium of communicating the desired information, for any gentlemen who may be disposed to forward their Reports in pamphlet form; and it is our intention to publish hereafter, in the Journal, a part, or the whole of every Report, which has in it any thing which we think may be useful to those interested in Railroads.

We now have on hand many documents, from which it is our intention to make copious extracts.

**TO RAILROAD CONTRACTORS.**—The advertisements of the Baltimore and Susquehanna, and the Wrightsville and York Railroad Companies, published in this number of the Journal, will, we presume, receive proper attention from those of our

eaders who are engaged in that line of business.

**FAIR PLAY IS THE JEWEL.**—A worthy and valued correspondent of ours says, in referring to the letter of E. F. Johnson, published in a recent number of the Railroad Journal, "It struck me as singular that you should publish this criticism, without having printed the document to which it refers,"—and it was as surprising to us as to our correspondent, that we had so long omitted to republish the "Document," or Report of Messrs. Jervis, Hutchinson, and Mills, which was addressed to the Canal Board in March last.

We were indebted, at the period of its publication, to Mr. Jervis for a copy, which we marked for publication, but which was put into pigeon hole No. 1, instead of the hands of the compositor, where it securely rested until we were induced, from reading the letter of Mr. Johnson, to examine the files of the Journal for the Report of those gentlemen, when, Lo! it was not there. As our object is to elicit the truth, for the general good, and not to oblige any one man, or set of men, we shall republish, in our next number, the Report of Messrs. Jervis, Hutchinson, and Mills; and shall then reprint a few extra copies of the Journal, containing both the Report and the letter of Mr. Johnson, that those who desire may have them together.

**TO CORRESPONDENTS.**—We have on hand several valuable communications for the Journal, in relation to, and accompanied by drawings of, various kinds of Bridges. One of them, that giving a representation and description of Colo. Long's Patent Bridge, has been in hand, we are ashamed to say, since January last; and another, upon the subject of a *Suspension Drawbridge*, has been in hand since March—both of which deserved better things than to be crammed into a pigeon hole, there to remain through the damps of spring and the heat of summer. If the gentlemen, who were so obliging as to forward them, will pardon this long delay, we will give them an early insertion, and promise more prompt attention to future favors.

We also have a plan of an *Iron Drawbridge*, designed for Canals, to which we shall also give early attention.

In addition to the above, we have been favored with the specifications and drawing of *Lewis Wernawag's Revolving Bridge*, and *Self-adjusting Railway Car*, both of which shall be attended to at our earliest convenience.

**STEAM ENGINE WANTED.**—A good, second hand, Steam Engine, of 10 or 12 horse power, is wanted for a boat to be used on a Canal. Any gentleman having an engine suitable for that purpose, which he can sell cheap, may address a note to, or call upon, the Editor of this Journal, who is desired to make inquiry, and to communicate the result to the advertiser.

*The Board of Directors of the New-York and Erie Railroad Company, beg leave to submit to the Stockholders, their first*

#### ANNUAL REPORT.

The Company was incorporated by the Legislature of New-York, on the 24th day of April, 1832, with power to construct a Railroad from the City of New-York to Lake Erie,—to transport persons and property thereon,—to regulate their own charges for transportation,—and to take tolls on any part of the route as fast as sections of ten miles should be completed.

The line of the route is not otherwise fixed by the charter, save that it is to be confined at all times to the southern tier of counties of this State, commencing at the City of New-York, or at such point in its vicinity as shall be most eligible and convenient therefor, and continuing through said counties, by way of Owego, to some point on the shore of Lake Erie within this State west of Cattaraugus Creek.

In evident contemplation of the construction of the different sections of the work progressively, the Company are allowed ten years from the date of their charter, within which to finish one-fourth part of the Road—fifteen years for one half—and twenty years for the whole. By an amendment passed May 8, 1835, they are authorized to commence the Road at any point on its route, which they may deem most eligible, and to use a single or double Railway thereon.

Being authorized to construct single, double, and even triple tracks, and transport persons and property thereon, they are allowed to receive subscriptions of capital stock to the amount of ten millions of dollars; but, by an amendment passed April 19, 1833, are empowered to commence the prosecution of their objects whenever one million shall have been subscribed.

The State reserve the right, after the expiration of ten, and within fifteen years from the completion of the Road, to take it, with its fixtures, for public use, on paying the cost thereof, to the Company, with interest at fourteen per cent. per annum.

No survey of the route had been made prior to the act of incorporation, but in the summer of 1832 a *reconnaissance* was conducted under the authority of the Government of the United States, by the late Colonel De Witt Clinton, which resulted in ascertaining that the supposed difficulties of the undertaking had been greatly overrated, and in presenting strong inducements for obtaining a more complete and accurate instrumental survey of the whole line.

It was at all times deemed desirable by the projectors of this enterprise, that the State should participate, in some degree, in the enterprise, for the purpose as well of diminishing the amount of funds necessary to be raised by private subscription, as of assuring protection to the individuals who might embark their means in the work. Whether the requisite assistance of the State should be afforded by a subscription from the public treasury to a portion of the stock of the Company, or a loan of the public credit at a low rate of interest, it was deemed important, and indeed essential, that the survey of the route should be conducted under the authority of the State Government, by engineers of its own selection,—so that any doubts might thereby be prevented, which the opponents of the proposed improvement could otherwise suggest, in respect to the accuracy or fidelity of the survey. An application being accordingly

made during the Session of 1834, a bill appropriating \$15,000 for the survey, and directing the Governor to designate the engineer, was passed on the 6th day of May, in that year, though not without an active struggle, and a close vote in both branches of the Legislature. In May, 1834, his Excellency Governor Marcy appointed BENJAMIN WRIGHT, of this State, to conduct the survey. He entered on his duties immediately after receiving the appointment, and previous arrangements having secured the speedy assemblage of an active corps of assistant engineers, the work was prosecuted with such assiduity, energy, and talent, that the survey of the whole line, 483 miles in length, was finished by the 15th of December in that year, and complete maps and profiles, with the Report, and estimates of Judge Wright, and his two principal assistants, were deposited early in January, 1835, in the office of the Secretary of State.

The plan of the route, recommended by that Report, strikingly manifests the sagacity and ability of this experienced Engineer, and justifies the confidence reposed in him by the Governor. It was peculiarly important to secure the exercise of the soundest discretion in respect to an undertaking embracing so great an extent of line, in order, if possible, to lessen or avoid the lavish and unnecessary expenditures which had been too often witnessed on other public works, both in this country and Europe. To the examination of this branch of the subject, Judge Wright brought the full benefit of his long and varied experience, and it is to the successful results of his efforts in this particular, that the accomplishment of the enterprise will be mainly indebted.

The expenses of constructing a Railroad, (excepting the cost of engineering and superintendence,) may be classified under the general heads, either of Land, Graduation, or Superstructure: denoting, by Land, the cost of acquiring title to the land occupied by the Road-way and its appurtenances; by Graduation, the preparation of the Road-way to receive the Rail-tracks, by means of excavations, embankments, and bridges; and by Superstructure, the tracks and turnouts.

In the present instance, the route of the Road traverses a country where land, as yet, is comparatively cheap; and, therefore, the heavy charges incurred in purchasing the Road-way, disturbing buildings, deranging city and village lots, extinguishing turnpike rights, and the other vexatious expenses incident to a work passing through a district more densely peopled, will be greatly lessened, if not altogether avoided.

The cost of the Rail-track, on this as on any other Road, will vary according to the materials, more or less destructible, of which it may be constructed. Considering that the country, along much of the route, will afford unusually cheap and excellent supplies of timber, it has been deemed altogether advisable to adopt the plan of the iron rail to be laid upon wood, instead of blocks or sills of stones,—proceeding on the principle, that it will be better economy to replace, from time to time, the destructible portions of a work composed in part of timber, than to incur a very heavy outlay, in the first instance, in constructing it wholly of iron and stone.

The reduction of expense to be thus obtained under the heads of Land and Superstructure, is the more important from the circumstance, that it is necessary for the purpose of securing a cheap and easy gra-

duation to lengthen considerably the line of the Road.

It is under the head of Graduation, (which usually embraces much the largest portion of the cost of Railroads,) that the efforts of Judge Wright to reduce the expense of the proposed work, have been most strikingly successful. The object of the graduation, is the conformation of the natural surface, by excavation or embankment, to the artificial grade or level prescribed by the profile of the work. The expense of that operation necessarily depends upon the cubic quantity of material, more or less, which the Engineer, in arranging the plan of the grades, may render it necessary to remove or transpose. It is obvious, therefore, that true economy requires the adoption, so far as may be consistent with the objects and ultimate utility of the Road, of the existing grades presented by the surface of the country, and the selection of such course for the route, as may correspond most nearly with the line of the natural level. According to the theory of Judge Wright, it is better to avoid than to subdue great physical obstacles—to go around the hills rather than to go over or cut through them,—and to seek a cheap and easy graduation by a circuitous route, rather than encounter immense expense in shortening and straightening the line.

In laying out the proposed Road, if a straight course were pursued through the Southern counties, from the City to the Lake, it is quite probable that its total length could be brought within three hundred and fifty miles,—and if the intervening elevations and depressions were cut down and filled up to an uniform level, regardless of the expense to be thereby occasioned, a Railroad laid on such a line would undoubtedly attain the highest degree of utility, of which that mode of communication is susceptible. Such an attempt, in the present instance, would, however, be totally unnecessary,—because the objects of the proposed enterprise do not require such a work, and can be sufficiently and fully accomplished by the cheaper and easier Road recommended by Judge Wright.

The public inconveniences which have led to the present undertaking, consist of the want, at all times, of a more direct and easy access to the Hudson River from the Southern counties of this State, and the total deprivation, during four or five months of the year, of all available means of intercourse between this City and the Western States. It is obviously not necessary, in order to remedy these evils, that a Road shall be constructed, on which the transportation of persons and property, from the City to Lake Erie may be effected, at a very extravagant or excessive rate of velocity, but that a Road upon which the whole passage may be regularly made, at all seasons of the year, within forty-eight hours, will be amply adequate to all the objects of its construction. Such a Road, on a cheap and feasible grade, is now recommended by the Report of Judge Wright; and, in the judgment of the Board of Directors, it will be sufficient for the purpose.

The peculiar topography of the extensive district traversed by the route, indicates the necessity of seeking, as far as practicable, the natural levels. A considerable portion of that section of the country, without being mountainous, has an undulating surface, intersected, however, throughout nearly its whole extent, by a chain or series of Rivers, which fortunately pursue, with little deviation, the general line of direction required for the route of the proposed Road. Those

streams are, moreover, free from sudden falls, flowing at a rate of descent unusually gentle, seldom exceeding fifteen, and frequently less than two feet to the mile, and presenting, almost invariably, on their margins, alluvial flats, interrupted only in a few insulated cases, (principally occurring on the Delaware,) by projecting bluffs. It is, therefore, evident, that by selecting the banks of those streams for the line of the Road, the necessity of cutting through the hills transversely may be avoided, and a graduation obtained, already prepared, as it were by nature, for the reception of the Railway.\*

It is this peculiar and striking feature in the surface of the country, as presented by the maps and profiles, now in the office of the Company, (and which the stockholders are particularly invited to inspect,) which will explain the reason why a cheap and easy route has been discovered for the Road in question. By that examination it will be seen, that more than four-fifths of the whole line of 483 miles lies immediately upon the banks of Rivers and their tributaries: that one uninterrupted section of one hundred and twenty-five miles long, is situated on the margin of the Susquehanna and its principal branches; another of eighty-three and a half miles along the Alleghany and its tributaries: one of sixty-nine, and another of thirty-nine miles along the Delaware and its principal confluent; and that other minor sections along the smaller streams, including nineteen miles in the valley of the Ramapo, make up a total amount of at least four hundred and twenty miles, in which the route of the Road obtains the advantage of following the margins of water-courses.

Of the remaining portions of the line, embracing in the aggregate about sixty miles in length, where the route crosses the valleys of the streams more or less transversely, about thirty miles are comprised in different sections within the counties of Sullivan, Orange, and Rockland,—about twenty miles between the head waters of the Delaware and those of the Susquehanna and Chenango,—and the remaining ten miles in the descent to Lake Erie; and, nevertheless, with a single exception hereafter particularly mentioned, no part of the graduation of those portions of the line is found to be uncommonly expensive. The exception is presented in the passage of the Shawangunk Ridge, in the county of Orange, on the east side of the Delaware and Hudson Canal, at the seventy-fourth mile of the route, at which point a rapid descent of three hundred and fifty feet, must be encountered in a section of three miles. To obtain an easy passage over this part of the route eventually will require, either two inclined planes, similar in size and extent to those on the Mohawk Road, and costing about \$50,000 each,—or a deep cutting on the summit of the ridge, at an expense of about \$70,000,—or a tunnel of nine hundred yards long, at an expense of \$175,000.

After attentively examining these different modes of overcoming the difficulties presented by this particular section, Judge

Wright, in his Report to the Legislature, recommended, as being most economical in the first instance, the deep cutting on the summit of the ridge, and the employment, at that point, if necessary, of auxiliary locomotive or animal power,—but he referred to the probability and necessity, in case of a great amount of transportation, of the eventual construction of a tunnel.\* Whichever of these plans may be adopted, the total expenditure in constructing this section will not exceed from two hundred or two hundred and fifty thousand dollars;—and it is now particularly adverted to by the Board, not as affording any reason for apprehension or discouragement, or as presenting difficulties of unusual magnitude, but because it exhibits the only considerable instance upon the whole route of the Road, in which its graduation will not be uncommonly easy, cheap, and feasible.

According to the estimates accompanying the Report of Judge Wright, the graduation of the Road, with solid embankments for a double track from the Hudson to Lake Erie, including the excavation at the Shawangunk Ridge, will cost \$2,717,518, being at the rate of \$5,626 per mile, which amount includes the cost of bridges, culverts, clearing, fencing, and, in fact, every expense whatever necessary in order to prepare the road-bed for the reception of the superstructure.

He further reported, that a superstructure of iron laid upon timber, would, in his opinion, be most expedient (at least, for the first or single track,) and would cost \$3,400 per mile; being, for four hundred and eighty-three miles, - \$1,642,000

That the cost of the graduation, as above stated, was -	2,717,518
To which latter item be added, for contingencies, ten per cent. -	271,751
And for engineering three per cent. on the two first sums, -	130,791

Being for the whole work, - \$4,762,360

In the above estimate nothing was allowed under the head of land necessary for road-way, principally because the inhabitants along the different routes surveyed, had proffered, almost unanimously, to execute voluntary sessions of so much land as might be requisite. In addition thereto, several of the landed proprietors, especially on the western sections of the route, had stipulated to make liberal donations in aid of the enterprise, and to an amount much exceeding in value any sums which would probably be awarded by the Commissioners, in the few instances in which unworthy attempts might be made to exact an extortionate price for the right of way. In reference, however, to the immense amount of travel and transportation, which the Road was destined, ultimately, to accommodate, it was deemed necessary to lay out the Road-way not less than six rods wide, requiring, for that space, twelve acres to the running mile, being for the four hundred and eighty-three miles, five thousand seven hundred and ninety-six

\* The graduation of that part of the Baltimore and Ohio Railroad, which cuts transversely through the ridges between Baltimore and the Patuxent River, cost upwards of \$40,000 per mile; while that of the sections which follow the course of that stream, cost less than \$9,000 to the mile.

The graduation of the Mohawk and Schoenectady Railroad, not following any considerable water-course, is said to have cost at least \$25,000 per mile; while that of the Erie and Schoenectady Railroad, laid out on the bank of the Mohawk River, has been put under contract at about \$5,000 per mile.

\* The construction of tunnels, within the last few years, has become familiar to the Engineers of this country, four or five having been successfully completed, during that time, within the State of Pennsylvania. The cost of their construction varies from two to five dollars per cubic yard,—the tunnel through the Alleghany mountain, on the main line of the public works of Pennsylvania, having cost \$68,700, including arching, the excavation having been less than two dollars per yard: The cubic quantity of excavation required for the proposed tunnel through the Shawangunk Ridge, will fall short of 40,000 yards.

acres. The average price of land along the route, how much soever it may be augmented by the completion of the Road, does not, at present, exceed fifteen dollars to the acre,—so that, even if it were necessary to purchase the right of way, or submit to an appraisal throughout the whole line, the aggregate expense would not exceed \$88,940.

It had become evident, at an early period in the history of this enterprise, that it was destined to encounter active opposition. In some of the villages in that part of the State traversed by the Erie Canal, apprehensions had been excited that the construction of the proposed Road might operate injuriously upon their local interests. The people of that quarter of the State had been led to suppose, however erroneously, that in order to retain and preserve the sectional advantages which they enjoyed, it was necessary to compel the population of the southern counties to seek, through the Canal, a circuitous and expensive route to the sea-board; and that it would be impolitic to allow them the means of more direct and constant access to market, which would be afforded by the proposed Railroad. When it was recollected, however, what immense benefits had been bestowed by the construction of the Canal, upon the favored districts which it traverses, in the rapid progress of their agriculture, commerce, and wealth,—what amounts of the common treasure had been expended in accomplishing that object,—with what alacrity the more sequestered counties had contributed, year after year, their proportion of the taxes rendered necessary by that expenditure,—and, above all, when it was seen, that in order still further to increase the travel and transportation through the northern portions of the State, the public treasury was called upon to expend from six to eight, and, not improbably, from ten to twelve millions in enlarging the Erie Canal, the hope was indulged, that the scanty portion of the public bounty, which the southern counties might require, in order to enable them to participate in the general prosperity, would not be withheld, and that their efforts to develop their own resources and improve their condition, would be regarded with a kind and liberal spirit.

No sooner, however, was the Report of Judge Wright presented to the Legislature, showing the feasibility of completing, at a moderate expense, the desired channel of intercourse through the southern section of the State, than a combination of local interests, singularly violent in character, was arrayed to defeat the enterprise. The most active and determined exertions were made, openly by some, and covertly by others, to prejudice the public mind, and discourage, if possible, the friends and promoters of the undertaking. The object was denounced as chimerical, impracticable, and useless. Anonymous writers were employed to pronounce the survey inaccurate and deceptive, and the estimates unsafe and fallacious. The Road, it was declared, could never be made,—and, if made, would never be used. The southern counties were asserted to be mountainous, sterile, and worthless,—affording no products requiring a road to market,—or if they did, that they ought to resort to the valley of the Mohawk, as their natural outlet. The whole enterprise, supported as it was, by great masses of the population of the State, was pronounced to be a mere scheme of stockjobbing, and stigmatized as an attempt to deceive the southern counties—defraud the public—and ruin the individuals who might embark in it.

The Board of Directors have never deemed it necessary to notice these attacks upon the great enterprise committed to their charge, further than to invite and urge the opponents of the work to point out the specific portions of the survey or of the estimates, which they might suppose to be inaccurate. The maps and profiles were deposited in the public offices at Albany, where any errors, if they existed, could easily have been detected. No attempt to do so was ever made, to the knowledge of the Directors, and they therefore dismiss this branch of the subject with the declaration, that they continue steadfastly to rely, upon the accuracy, fidelity, and capacity, of the Engineer who was selected by the Governor to conduct the survey.

The question, whether the Road when constructed, can be advantageously used for the purposes of travel and transportation, can be settled practically, and without entering at all into scientific details. It is necessary, only, to state the decisive fact that *the steepest grades adopted on the plan of the work, will be less severe than those upon that part of the Baltimore and Ohio Railroad which is now finished and in successful operation.* That Road is used, during winter and summer, for the transportation not only of passengers and the public mail, at high rates of speed, but also of cars, heavily loaded with flour, provisions, live stock, and other agricultural products; and a rapid increase has been experienced in its business, as the line has been extended into the interior. It will not, therefore, be deemed visionary to predict, that the proposed Road, passing over acclivities less severe, and through a country more extensive and not less fertile, cannot fail to accomplish results equally advantageous.

In view, however, of the recent improvements, in augmenting the usefulness and power of locomotive engines, enabling them to surmount increased grades of acclivity, and in reference, also, to the varied products of the country to be traversed by the route, and to the diversified character of its surface, it has been deemed important by the Board of Directors, that the plan of the whole Road, including the arrangement of the grades and of the engines to be employed, should be carefully settled under the best advice, so as to secure the utmost economy of labor and power, and thereby reduce the cost of transportation to the lowest practicable limit. In order, therefore, effectually to discharge this portion of their duty, the Board of Directors thought it expedient with the cheerful acquiescence and upon the invitation of Judge Wright, to associate with him in consultation Mr. Moncure Robinson, the Chief Engineer of several of the public works of Pennsylvania, and Mr. Jonathan Knight, the Chief Engineer of the Baltimore and Ohio Railroad, thus constituting a Board of Engineers pre-eminently qualified by experience, talents, and professional acquirements, to decide upon the matters submitted to their consideration. A conference accordingly took place in August last, and was continued at the office of the Company in this city, until the plans and profiles presented by the surveys had been fully examined; after which these Engineers proceeded in person to inspect the Shawangunk Ridge, and settle upon the most advisable mode of overcoming the difficulties in its passage, which are above adverted to.

In September following they presented their conjoint Report to the Board of Directors, which is now published for the information of the stockholders. The unani-

mous opinion which they therein express as to the practicability of dispensing altogether with stationary power,—the rate of velocity to be attained, and the weight of the loads to be transported throughout the whole line, exceeding the expectations of the most sanguine friends of the enterprise,—must dissipate effectually any further doubts as to its feasibility or usefulness; while the judicious arrangement of the grades—the admirable adaptation of different engines and rail tracks to the different divisions of the Road, and the simple, effectual, and economical mode of accumulating auxiliary locomotive power at those points of increased acclivity where it was found to be necessary—all attest the genius and judgment of those distinguished Engineers. Upon their unanimous testimony, the Board of Directors now have the gratification of announcing to the stockholders the following result, to wit:—*That loads of sixty tons gross, (or deducting the weight of the cars, forty tons net), may be drawn in a single train from the Hudson River to Lake Erie, and at an average speed from twelve to fourteen miles to the hour;—that with the rate of speed augmented one half, a locomotive engine will nevertheless suffice to transport two hundred passengers and their baggage; that no stationary engine will be requisite on any part of the work; and that one, or, at most, two auxiliary engines only will be requisite on the whole length of the line.*

Upon that consultation the plan of Judge Wright was modified only in a single particular. Instead of selecting any one particular plan of superstructure, as proper for the whole route, the Board of Engineers recommended,—in view of the necessity of employing greater locomotive power in surmounting the severer grades on the easterly sections, embraced within the counties of Rockland, Orange, and Sullivan, than would be requisite on the gentler acclivities presented on the remainder of the Road,—the adoption of the eight ton engine and the iron edge rail on the first one hundred and thirty-six miles, between the Hudson and the mouth of the Callikoon, at a cost of \$6,000 per mile, and of the six ton engine and iron plate rail, laid on timber, on the remaining three hundred and forty-seven miles, from the mouth of the Callikoon to Lake Erie, at a cost of \$3,000 to the mile.

In estimating the expense of the superstructure, Judge Wright, after specifying the cost of several plans, had stated that a superstructure, throughout the whole route, consisting of the iron plate laid upon timber, could be completed at an expense varying from \$2,800 to \$3,400 per mile, being, for 483 miles, at \$3,400, \$1,642,000

The superstructure adopted on the consultation will cost—	
136 miles at \$6,000	\$816,000
347 " " 3,000	1,041,000
	<hr/> 1,857,000

Being a variation of	215,000
The Engineers, on their consultation, also recommended the adoption of the tunnel through the Shawangunk Ridge, instead of the deep cutting upon its summit, which alteration will require an increase of expenditure, not exceeding	100,000

Making the total increase	\$315,000
---------------------------	-----------

The estimate of the cost of the whole Road, upon the plan as modified on the consultation, will then stand thus:

Graduation reported by Judge Wright,	\$2,717,518
Extra expense of adopting the tunnel,	100,000
	\$2,817,518
Superstructure as settled on the consultation,	1,857,000
	4,674,518
To which add for engineering and the expenses of the Company,	300,000
The cost of vehicles and other necessary apparatus, to be increased as the business of the Road shall extend, will be covered in the first instance by	500,000
	5,474,518
To which the Board of Directors, for more abundant cautions, now add for contingencies,	525,482

Total \$6,000,000

Requiring a net revenue of \$350,000 to produce a return of six per cent. per annum.

To the great majority of the present stockholders of the New-York and Erie Railroad Company, who are merchants or landowners in the City of New-York, no incentive is necessary to secure their zealous support of this great enterprise, in addition to the stake which they hold in the general welfare of the community of which they are members. To those persons, however, who may have embarked their means in this undertaking for the purpose only of realizing pecuniary advantages on the investment, it is proper to state, that in the opinion of the Board, the income of the Road, as soon as it shall be finished, will much exceed the sum of \$360,000 above stated.

It is evident, that the rate of revenue, whatever it may be, immediately on the completion of the Road, will undergo a steady and rapid increase, and fully keep pace with the growth of the extensive communities from which its business is to be derived. If, therefore, it be reasonably probable that the income of the Road will commence at a rate even as low as five per cent. per annum, the certainty of its speedy increase will suffice, in the opinion of capitalists, fully to sustain the value of the stock.

If the experience afforded by the Erie Canal is taken as a guide, it may be safely stated, that the accomplishment of the proposed work will add not less than one third to the present population and trade of the City of New-York, and augment in an equal degree its landed wealth;—and that it will double, if not quadruple, the present value of the extensive district embracing six millions of acres in the southern and middle counties of this State. When it is considered also,

\* The Railroad now constructing between Sandusky and Dayton, will connect Lake Erie with the Ohio. A similar union will be effected further west, by a chain of Railroads, (for most of which charters are already granted), in the State of Indiana. A Railroad has already been commenced at Alton, on the Mississippi, at the mouth of the Missouri, which it is proposed to extend from that point to Lake Erie. It is contemplated also to connect the Ohio River at Louisville with Nashville in Tennessee; and a Railroad is already commenced, extending from Nashville to the City of New-Orleans.

When the links in the grand chain shall all be completed, passengers may travel from Lake Erie to the Gulf of Mexico, (1150 miles), in four days, and from New-York to New-Orleans, (by the way of the Lake), in seven days.

that by means of this great avenue of intercourse—and its tributaries now rapidly springing up and spreading through all the great valleys of the West, bringing Lake Erie into close connexion with the Mississippi and Missouri, and extending southwardly even to the Gulf of Mexico,\*—the immense inland communities upon the Western Waters, for the purpose of trade, will be rendered commercially tributary to this State and its metropolis, it becomes difficult to fix, within any moderate bounds, the value of the proposed road, or the amount of travel and transportation which it is destined to create and accommodate.

In estimating the business to be derived from the communities along the route of the Road, it is certainly a circumstance of no little moment, that the inhabitants of the southern and middle counties, remote more than one hundred miles from the Hudson River, who will resort to this channel of communication in order to find access to the seaboard, already exceed in number the population which were contained within the counties (equally remote from the river) adjacent to the Erie Canal, three years after its commencement. The animating impulse, which the disbursement of the moneys expended in the work, will impart to every species of industry in the southern counties, creating villages, cities, and flourishing communities, cannot fail to accelerate, most rapidly, their progress in population, prosperity, and wealth, and augment at the same time their capacity to supply a profitable and increasing business to the Road. The celerity and regularity of passage which it will afford, at all seasons, between the City and Lake Erie, will secure a lucrative revenue in the transmission of passengers, merchandise, and the mail,—sufficient, in the judgment of the Board, to yield an adequate income on the whole expenditure. During the four or five months of the year in which the severity of climate renders useless our Canals, Lakes, and Rivers, the Road will present the only available channel of communication between the City and the more central and populous portions of the interior, and at the same time will remedy the evils now suffered by the mercantile community, in being deprived of the means of transmitting merchandise to its consumers early in the spring, and late in the autumn. The rapid augmentation, which the successful accomplishment of the work will occasion in the population, extent, and wealth of the metropolis, will, in its turn, react on the interior districts, by affording them an increasing market for their agricultural products, while those supplies will serve to cheapen the price of subsistence in the metropolis, and thus the mutual and beneficial dependence between the City and the interior, and the consequent increase in the population and prosperity of both, will constantly operate to swell the amount of travel and transportation, to be borne over the Road.

The Directors of this Company, in forming their opinions as to the feasibility and productiveness of the proposed work, deeming it their duty to rely as little as possible on mere representations, have personally inspected by themselves, and their immediate officers, during the present summer, the whole line of the route. That examination has resulted in confirming their belief, that the work is singularly feasible: that it may be completed and put in operation, with all the necessary vehicles and appurtenances, at a cost not exceeding six millions of dollars:—that it will immediately enjoy a great and increasing revenue:—and that

every inducement exists for prosecuting the enterprise with undiminished vigor.

It is to be understood, however, that the above estimate of six millions does not include the expense which the Company may ultimately incur, in constructing double and triple tracks, as soon as an increased business shall render them necessary—nor the expense of continuing the Road, from a point in West Chester county, opposite the place where it will reach the Hudson, into the City of New-York. Both of these measures will undoubtedly be carried into execution, as soon as the progress of the Road westwardly shall render it expedient.

In order to obtain the above sum of six millions, the Board of Directors have resolved,

1. To issue stock to subscribers to the amount of three millions.

2. To expend that sum in constructing such sections of the Road as may most probably yield an immediate revenue.

3. To raise the remaining three millions either by a loan from the State or foreign capitalists, on a mortgage of the Road, or by issuing that additional amount of stock.

If the Company could have secured, in the first instance, the whole sum of six millions, either in subscriptions of that amount of their stock, or in subscriptions of a part, and a loan of the residue, there would have been no difficulty in putting the whole line of the Road under contract, so as to complete the work in five years from the present season.

If, however, the Company shall be compelled to confine their operations within a more limited sphere, to make contracts for work to the amount of three millions only, and await the result of that expenditure before obtaining subscriptions or negotiating a loan for the residue, they will be obliged to construct the Road by sections progressively, and in that event its final completion may be considerably delayed.

Although the Board may be well satisfied, that by constructing a portion only of the Road, a sufficient revenue would be secured, yet there can be no doubt but that the interests of the stockholders, as well as those of the public, will be greatly promoted by completing the whole line with the least practicable delay. The experience of the Erie Canal, and in fact, of all the public works in this country, has sufficiently demonstrated, that the income of each section is augmented in proportion to the progress made in lengthening the line of communication, and that, too, in a geometrical ratio; while it is evident that the public advantages to be derived by this City, in preserving, by means of the proposed work, the trade of the West, cannot be realized, to any considerable extent, until the Road shall be completed from the Hudson, at least as far west as the Alleghany River.

Notwithstanding these considerations, it is a circumstance eminently calculated to insure the ultimate success of this enterprise, that the work is divisible into separate portions, each of which, taken by itself, may become profitable; so that the stockholders may receive dividends on their investments long before the completion of the whole Road. Thus, the short section of twenty and a half miles, between Owego and Binghamton, connecting the Chenango Canal with the Owego and Ithaca Railroad and the steamboat navigation of the Susquehanna;—that of thirty-five miles connecting Owego with Elmira, and there meeting the Chemung Canal on the north, and the Railroad from the coal mines of

Pennsylvania on the south;—and that of one hundred and ten miles, connecting the Delaware and Hudson Canal with Bettsburg in Chenango county, and there uniting with the Railroad in active progress from the latter place to Utica,—may each, if completed separately and without reference to the residue of the line, become sufficiently lucrative to warrant the Company in entering upon its construction, before securing the means of completing the whole Road from the Hudson to Lake Erie. In this light, therefore, the New-York and Erie Railroad may be regarded, not only as one great avenue of communication between the Atlantic Ocean and the Western waters, but also as a connected series or chain of independent works, similar in character to those which are now in progress or in contemplation, under the direction of separate companies, between Albany and Buffalo,—possessing, however, the very important attribute of being united under one common Board of Management, and thereby guarding the public against the irregularities and vexatious delays, inevitably arising from the want of perfect union, between the several links of the chain.

The estimated expense of the whole Road may be distributed under the following divisions:—

77 miles from the Hudson River at Tappan, to the Delaware and Hudson Canal in Orange county, (including the passage of the Shawangunk Ridge,)	\$1,064,156
110 miles from that point to Bettsburg,	1,228,147
35 3-4 miles from Bettsburg to Binghamton,	418,679
90 1-2 miles from Binghamton to Owego,	193,264
35 miles from Owego to Elmira,	261,180
126 miles from Elmira to the Alleghany River, near Olean,	928,545
78 3-4 miles from that point to Lake Erie,	648,547

493 \$4,674,518  
adding to each particular estimate about twenty-eight per cent. for engineering, vehicles, and contingencies, according to the ratio of the general estimate herein before stated.

In July, 1833, one million of dollars were subscribed to the stock of this Company, on which the first instalment was paid conformably to the charter. For the purpose of obtaining the advantages to be derived from having the route surveyed under the authority and direction of the State government, and under the clause of their charter which allows five years from April, 1832, within which to expend \$200,000 on the Road, the Company did not commence their field operations until the present year. As soon, however, as the very favorable results of the survey by Judge Wright were made known to the public, the Company, in February last, after some changes in their Board of Directors, made preparations for the vigorous prosecution of the enterprise. As a preliminary measure, and in order, if practicable, to provide sufficient means to authorize them to put the whole Road under contract, and thus to finish the work with the least possible delay, they presented their petition to the Legislature, at its last session, praying for a loan of the credit of the State in aid of the work. A bill was accordingly reported in the House of Assembly, authorizing a loan of two millions to be advanced, in four successive instalments of \$500,000 each, ac-

ording to the progress of the work, and to be secured, together with the payment of the interest thereon half yearly, by a mortgage on the whole Road—to which an amendment was proposed, requiring the Company, with their own means, to finish the entire section of one hundred and forty-five miles between the Delaware and Hudson Canal and Binghamton, before receiving the first instalment of the loan. While the bill was pending in the Assembly, the Common Council of the City of New-York, in view of the public importance of the proposed measure, after a full and elaborate examination of the subject, and a report setting forth the pressing necessity of completing the Road without delay, by a unanimous vote in both their branches, directed the Mayor to petition the Legislature, in the name of the city, for the passage of the bill. A similar memorial was presented by the municipal authorities of the city of Brooklyn, accompanied by innumerable petitions from the population of the long line of southern and middle counties interested in the work. The merits of the measure were ably and zealously advocated by the members from those counties—and by a portion of the representatives of this city:—but it encountered such an array of opposition, arising principally from the Canal counties, that after an animated and interesting debate of three weeks, it was defeated in the Assembly by a majority of two votes.

Immediately after the defeat of their application to the Legislature, the Board of Directors appealed to the enlightened self-interest and public spirit of the inhabitants of the city of New-York and the counties along the line, for such further subscriptions to the stock of the Company, as should secure, beyond doubt, the ultimate completion of the enterprise. They were so far successful, that 13,821 shares of one hundred dollars each, (in addition to the 10,000 taken in 1833,) were subscribed to the capital, virtually placing at the disposal of the Board the aggregate amount of \$2,382,100. In the judgment of the Directors, the subscription of that sum has insured the accomplishment of the whole work, inasmuch as it will enable the Company to finish a section of the Road sufficiently extensive to become profitable to the stockholders, and by that demonstration will afford the means of securing the funds requisite to complete the residue.

In truth, the final accomplishment of this enterprise has become a question only of time, and it will be for the community to decide how long they will choose to suffer the inconveniences which may arise from the more tardy execution of the work. The strong manifestations of public sentiment, since the adjournment of the Legislature, afford good reason to believe that the unanimous wishes of the people throughout the extensive portion of the State to be benefitted by the Road, must ultimately prevail, and that a future Legislature will deem it proper and patriotic to facilitate its speedy completion.

The proceedings of the large and respectable Convention of Delegates from the southern and middle counties, recently held at Owego, and their spirited appeal to the people of the State, manifest in a very gratifying manner, the determination of the inhabitants of those important and populous districts to sustain the efforts of the

\* The thanks of the community, in this respect, are particularly due to Messrs. Roosevelt, Wetmore, and Hall.

Company, and exhibit, moreover, decisive evidence that several of the largest counties, which opposed the project through their representatives in the last Legislature, are now to be found among its most determined supporters.

Flattering, however, as the prospects of the Company may be deemed, and highly as they appreciate the generous support which they have uniformly experienced from the people of the southern counties, the Board of Directors are nevertheless bound, in prudence, not to hazard the success of the work by anticipating aid from the State, or by entering on any expenditures beyond the means actually within their reach.

The capital stock of \$2,382,100, already secured, will enable the Company to put under contract and complete at least two hundred miles of the Road; and the only duty occasioning any embarrassment is to select that portion which will most probably yield the largest immediate revenue, and thereby afford the surest basis for extending the credit and increasing the available means of the Company.

In April last, the Board of Directors appointed *Benjamin Wright*, Chief Engineer of the Company, and *James Seymour*, who had been one of his principal assistants in conducting the State survey, Division Engineer of the Eastern Division of the Road, embracing the counties of Rockland, Orange, Sullivan, Delaware, and part of Broome.

They have also appointed *David Rugles*, of Orange county, their General Agent, to render such services as might be required in obtaining cessions of lands necessary for the purposes of the Company, and to discharge such other active duties in aiding the progress of the work, as should be assigned to him.

The first instalment paid in upon the 13,821 shares, amounting to \$129,105, has been deposited, temporarily, on interest, in the Phenix Bank, and other moneyed institutions in this city; out of which the Board have expended, up to the present date, \$27,351 42, principally in the expenses of Engineer Department.

The only salaried officers in the employ of the Company, are the Chief Engineer and his subordinates, the Secretary, the General Agent, and a Clerk.

The corps of Engineers, as arranged by the Chief Engineer, has been generally divided into seven, and sometimes into nine distinct parties, and diligently occupied, up to the present time, in revising and improving various parts of the line on the Eastern Division. The Report made by Judge Wright to the Legislature, adverted to the probability of shortening the line and diminishing the expense, by more minute exploration of the country. The result has realized his expectations. It is already discovered that the line between the Hudson River and Binghamton may be shortened several miles, without any material increase of expense or alteration of the grades.

In view of the public character of the work and the general accommodation of the country, and for the purpose, also, of affording satisfaction, as far as possible, to the inhabitants of the counties traversed by the route, the Directors have deemed it their duty to direct the Chief Engineer to explore every line which there could be any reasonable probability of adopting. By the last monthly report of the Engineer of the Eastern Division, it appears, that since the 1st of May last, 580 miles of line have been carefully run by the parties, under his

direction. This minuteness of examination has, however, operated to delay the Chief Engineer in making a final selection of as much of the route as the Board could have wished. The route of forty miles of the line along the Delaware, where only one of the banks of that river lies within the boundaries of this State, is, however, so far fixed by nature, that it may be definitely adopted without further delay, and the Directors have therefore ordered this section extending from Deposit down the Delaware to the mouth of the Callikoon, to be advertised for contract. The notices will expire on the 5th of November next, and although it is not improbable that the present high price of labor and provisions may affect the lettings somewhat unfavorably, the Board nevertheless believe that the whole of the graduation will be put under contract at a price below the original estimate.

By the last monthly report of the General Agent, it appears, that of the land necessary for the Road in this section of forty miles, upwards of thirty miles has already been gratuitously ceded, and that the residue will probably be obtained without any serious difficulty or delay.

With the exception of the section embracing the Shawangunk Ridge, the graduation of the forty miles now advertised, presents the portion comparatively the most expensive of the whole line, (exceeding according to Judge Wright's estimate, \$9,500 per mile), but, for that very reason, the Directors have felt the more willing to select it as the section first to be constructed, in order to encounter at once what are supposed to be the difficulties of the work, and also to test, by actual experiment, the question of its feasibility.

Whether it shall be deemed expedient, after obtaining the results of the revisory surveys now in progress, to select, as the portion of the Road on which the present capital is to be expended, the section of one hundred and sixty-six miles, extending from the Delaware and Hudson Canal (at Deerpark) to Owego, estimated at \$1,780,090,—or the section of one hundred and eighty-seven miles, from the Hudson River to Bettsburgh, on the Susquehanna River, estimated at \$2,292,303,—the forty miles now advertised, will, in either event, constitute a part of the portion thus to be selected.

The completion of either of those valuable divisions of the work will become eminently beneficial to the Company. A Railroad leading from the Hudson to the Susquehanna, will open into a very extensive grazing district, and if continued, as proposed, by the lateral Railroad from Bettsburgh to Utica, will establish, at once, a winter communication between this city and the heart of the interior:—while, on the other hand, by completing a continuous line of the Road from the Delaware and Hudson Canal to Owego, and thence by means of the latter Railroad to Ithaca, a very important channel of transportation will be opened to that Canal, from the fertile and populous districts adjacent to the inland Lakes of this State and the western tributaries of the Susquehanna, affording, also, the means of transporting passengers from the interior to a point, distant, less than thirty-five miles from the Hudson River. The necessities of the community, and the certain prospect of a rapid increase of revenue, could not fail to insure the speedy extension of the line, either from Bettsburgh, westwardly, in the one case, or from the Canal eastwardly in the other.

The completion of the work from the

Hudson River to Owego, desirable as it may be deemed, sinks, however, into comparative insignificance, when compared with the importance of extending the line still further westwardly to the Alleghany River. After an attentive examination of the capabilities of that most valuable water-course, made by a Committee of the Board during the present season, and the remarkable facilities it presents for cheap, rapid, direct, safe, and early communication between the city of New-York and the great valleys of the Ohio and Mississippi, the Directors have become firmly persuaded that it is an object, if possible, of more consequence to the mercantile community that the Railroad should reach the Alleghany River, than Lake Erie itself. They have ascertained, that the descending navigation of that stream is available throughout the months of March and April, and frequently during the whole of May:—that, during that season, its channel is wide and spacious, sufficiently deep and free from rocks, bars, or any other impediment:—that merchandise placed on its banks as early as the 1st of March, may be delivered in four days thereafter at Pittsburgh, (for a price not exceeding fifteen cents per hundred,) and thence distributed throughout the populous communities along the Ohio River, at the opening of navigation;—that the merchants of New-York will thereby obtain direct and early access to consumers, nearly three times as numerous as the whole population around the Upper Lakes;—that these immense advantages may be obtained without any alteration or improvement in the natural condition of the stream, and merely by extending a Railroad to its banks from the Hudson;—and finally, that active measures are now in progress in the western portion of Pennsylvania, for the purpose of improving, still further, the navigable facilities of the River, whereby an uninterrupted channel of trade, both ascending and descending, will be opened between Pittsburgh and the interior of this State, during at least eight months of the year.

The completion of the Railroad from the city of New-York to the Alleghany River, is the only mode in which the vigorous efforts of Pennsylvania to secure to her own metropolis the trade of the West, can be effectually counteracted. Not content with establishing the line of communication between Philadelphia and Pittsburgh, and thereby controlling the commerce of the Ohio River, the enterprising citizens of that State are now constructing a Canal in the valley of the Mahoning, extending from a point near Pittsburgh, northwesterly, across the State of Ohio, and reaching the Ohio Canal, in the vicinity of Cleveland, on Lake Erie;—and it is the avowed object of that measure, to attract to Philadelphia the whole of the early trade of the Upper Lakes, and thus cut off from the City of New-York one of the most important branches of inland commerce, by which it has been hitherto supported and enriched. The pressing and urgent necessity of effecting a connection, as soon as possible, between the Hudson River and the Alleghany, in order to save this branch of our trade, will therefore be obvious: for if the merchandise of New-York can reach Pittsburgh as soon as that of Philadelphia, the Mahoning Canal will be open alike to both, and so far from affording any preference, in point of time, to either of the competitors, will operate only to expedite the transmission, in the spring, of merchandise from New-York destined for the regions around the Upper Lakes. The spirited exertions, which the mer-

chants and Board of Trade of Philadelphia have used to hasten the construction of the Mahoning Canal, will, however, insure its completion three or four years sooner than the New-York and Erie Railroad can be finished, from Hudson to the Alleghany, unless aid be afforded by the Legislature; and, in the mean time, a new channel of commerce will have been created, and new business relations established, between Philadelphia and the country around the Lakes, which it will be difficult to disturb, and which must operate very injuriously upon the commercial prosperity of the City of New-York.

Nor is this the only evil with which this metropolis is menaced by the superior activity and enterprise of its powerful and sagacious rival. The trade of a large and important part even of our own State, is also in danger of being diverted. The navigable rivers which drain a great portion of the southern counties, in descending to the ocean, flow through the State of Pennsylvania, and they naturally attract, in the same direction, an amount of exports, estimated to exceed 130,000 tons annually. The public men of that commonwealth, conscious of that natural advantage, have constantly sought to avail themselves of it, by improving the navigation of those rivers, and constructing Canals along their margins. In a Report made as early as 1791, by Robert Morris, the first President of the Inland Navigation Company of that State, the superior facilities presented by the Susquehanna, for securing a large share of the inland trade of New-York, were particularly dwelt upon. In 1808, under the administration of Governor Snyder, the route was surveyed from the Susquehanna to the Seneca Lake. In 1827, the Canal Commissioners of Pennsylvania, after reporting that "a large tract of country, within the State of New-York, rich in vegetable and mineral productions, and embracing a population of nearly 200,000 inhabitants, is drained by the Susquehanna and its tributaries," declare, that "to the territory thus watered, nature points out the valley of that noble river as its great highway to market." In 1831, Governor Wolf, in his annual Message, adverted to "the great superiority which the main line of their improvements possesses over the Erie Canal of New-York, by presenting an open and safe navigation from four to six weeks earlier in the spring, and from two to four weeks later in the autumn;" and further added, that the same observations would apply with equal force to a Canal or slack-water navigation, up the valuable region on the north branch of the Susquehanna, "as possessing all the advantages in regard to a more early and late navigation, and affording a vent through the Pennsylvania Canal for much of the produce of the great and productive State of New-York." In his Message of 1833, he describes the State as being "threatened on all sides to be deprived of the commerce which the God of nature seems to have destined for its use," and recommends it, "in its own defence, to force the waters of Lake Erie to mingle with those of the Alleghany: the Ohio Canal to become tributary to the improvements of Pennsylvania—and the waters of the Cayuga and Seneca Lakes to unite with those of the Susquehanna."

The vigorous measures recommended by the Governor, have been carried into execution by the Legislature of that enterprising commonwealth, as well by constructing public works of inland communication at the

expense of the State, as by patronizing, with a liberal hand, the incorporated companies who are engaged in similar enterprises within their territory. In pursuing this enlarged and comprehensive policy, having for its aim the prosperity of the whole of their people, the Legislature have not sought to confine within any particular section or favored district, the internal trade of the State. Thus the Union Canal, and the Pottsville and Danville Railroad, both of which were constructed by private companies, were calculated to divert some portion of the business, which might otherwise have been monopolized by the main line of their public Canals, and, nevertheless, the Legislature deemed it patriotic to assist both of those companies, (and also the Chesapeake and Delaware Company,) by loans of the public credit.

Having succeeded in establishing the main line of artificial communication between Philadelphia and the Ohio River, the efforts of the State are now principally aimed at opening an avenue of cheap, early, and rapid intercourse between that city and the southern counties of the State of New-York. By means of the chain of Railroads now in progress from Philadelphia up the valley of the Schuylkill,—and thence to Danville and Sunbury on the Susquehanna,—and the continuation of the line from the latter point to Williamsport, on the northwest branch of that River,—and thence into Tioga County, in the State of New-York, where it meets the Chemung Canal at the village of Elmira,—it is designed to establish a line of communication, which will bring the most valuable and populous portion of the southern counties of this State, (now distant by the circuitous route through the Erie Canal, upwards of 450 miles from the City of New-York,) within 265 miles of Philadelphia. The link of communication between Elmira and Williamsport, was supposed to be sufficiently important to the State of Pennsylvania, to become the subject of a Special Message from Governor Wolf. A Company has also been incorporated by that State, to construct a Railroad from the northwest branch of the Susquehanna, to the southern line of Steuben county, in this State; and, in order to encourage and expedite its completion, the Legislature of Pennsylvania, at its last Session, passed a law to guarantee to the Stockholders an interest on their investments, for twenty years, at the rate of five per cent. per annum.

Nor is this active and efficient policy confined to Pennsylvania. For the purpose of attracting the trade of the West through the State of Maryland, the Legislature of that Commonwealth, in March last, loaned their public credit to the Chesapeake and Ohio Canal Company for two millions of dollars, and also for one million of dollars to the Baltimore and Susquehanna Railroad Company. The State of Virginia has also appropriated several millions from her public treasury, in subscribing to the stock of the various Canal and Railroad Companies, prosecuting works of internal improvement within her territory.

It is, indeed, impossible to witness the zealous and well directed efforts of the enterprising Companies, in the neighboring States, so firmly upheld by the liberal policy of their Legislatures, and aiming at the object of diverting from the City of New-York, its lucrative commerce with the interior, without perceiving the urgent necessity of constructing, with the least practicable delay, the great avenue of commercial intercourse, now become so pres-

singly necessary, leading from this metropolis, directly through the southern counties, to the Alleghany River and Lake Erie.

The Board of Directors, upon whom has devolved the responsibility of conducting this important work, believing it to be the only mode of rescuing the interests of this City from the danger in which they are placed, and feeling that the exigency of the case demands their best efforts, pledge themselves to the Stockholders and the community, to spare no exertions on their part, to carry the enterprise steadily onward to a successful issue. They firmly believe that its pecuniary results will amply remunerate those who may devote their means to its accomplishment; and that, as a measure of improvement, calculated to augment the power and wealth, and exalt the standing of the State at large, it cannot but commend itself to all who value aright the public character. The unrivalled extent of the work, stretching from the Atlantic to the Western frontier, and yet lying wholly within the jurisdictional limits of this Commonwealth: the magnitude and grandeur of its relations and capabilities, occupying, by its singular felicity of position, the dividing ground between the trade on the North and of the South, reaching, by its tributaries, on the one hand, far into the fertile regions around the Northern and Western Lakes, and intercepting with the other, the rich streams of commercial wealth in their descent towards the Ocean, and the Gulf of Mexico: and above all, its commanding political influence, in securing within our own borders, both in peace and in war, the rapid transmission of the public mail, and of the military forces and munitions of the republic, providing at the same time for the general defence, and strengthening the bonds of the national union,—may well entitle its friends and supporters to claim, in its behalf, the favorable opinion and regard of every citizen of the State of New-York, and the countenance and aid, so far as may be necessary, of the constituted authorities.

But in any contingency, whether those who may direct the public councils shall extend to this undertaking the patronage and support of the State, or shall deem it proper to leave the Company unaided to their own resources, such is the unshaken confidence of the Board of Directors, in the transcendent merits of the work,—its immense value,—its remarkable feasibility,—and its early and rapidly increasing productiveness, that they have no hesitation in declaring their unalterable belief, that the whole enterprise can and will be certainly, speedily and successfully accomplished, and that it will afford not only to the public, but also to the individuals who may embark their funds in the undertaking, all the benefits which have been anticipated by its most ardent friends and supporters.

By order of the Board of Directors,  
JAMES G. KING, President.  
New-York, September 29, 1835.

At a general meeting of the Stockholders of the New-York and Erie Railroad Company, held at their office in the City of New-York, pursuant to previous notice on the 29th day of September, 1835, Doctor Macneven was appointed Chairman, and Alderman Murray Secretary.

The Directors of the Company, being notified of the organization of the meeting, presented, through their President, James G. King, their first Annual Report.

The report being read,

It was Resolved, That the Directors be requested to cause copies of the report to be printed and circulated.

Resolved, That the thanks of the Stockholders be presented to the Directors, for their able and satisfactory report, and the attention which they have thus far directed to the interests of the Company.

Resolved, That the members who may be elected to represent this City in the next Legislature, be earnestly requested to give their zealous support to such measures as may be necessary to secure the co-operation of the State in facilitating the completion of this great work.

WILLIAM J. MACNEVEN, President.  
JAMES B. MURRAY, Secretary.

At a meeting of the Stockholders of the Company, held at their office, on the 1st day of October, 1835, pursuant to public notice, the following persons were unanimously elected Directors for the ensuing year, to wit:

JAMES G. KING,  
PETER G. STUYVESANT,  
SAMUEL B. RUGGLES,  
JOHN DUER,  
JOHN G. COSTER,  
STEPHEN WHITNEY,  
PETER HARMONY,  
J. GREEN PEARSON,  
PELATIAH PERIT,  
ELBERT J. ANDERSON,  
MICHAEL BURNHAM,  
JAMES BOORMAN,  
JOHN RATHBONE, JUN.,  
WILLIAM BEACH LAWRENCE, and  
GEORGE GRISWOLD,  
Of the City of New-York.  
JEREMIAH H. PIERSON,  
Of Rockland county, and  
CORNELIUS W. LAWRENCE,  
Mayor of the City of New-York.

And at a meeting of the Board, held on the second day of said October, they re-elected

JAMES G. KING, President.  
PETER G. STUYVESANT, V. President.  
And appointed  
SAMUEL B. RUGGLES, Comptroller.

TALMAN J. WATERS, Secretary.

To the President and Directors of the New-York and Erie Railroad Company.

Gentlemen:—The undersigned have examined the plans and profiles of the lines surveyed for the New-York and Erie Railroad, and have also, in accordance with your wishes, visited together the point at which the Shawangunk Mountain is passed near Deerpark, and are gratified in being enabled to report an entire conformity in their views, as to the best mode of overcoming the different obstacles presented on the route.

On seven portions of the Road points of increased difficulty are presented, either in the increased amount of elevation to be overcome, or in the rate of graduation which will be requisite. They are,

1. In leaving the Hudson at Tappan.
2. In passing from the top of the Shawangunk Mountain, across the valley of the Basherkill, and up the Neversink.
3. In the valley of the Callikoon.
4. In crossing the summits between the Delaware and Susquehanna, and between the Susquehanna and Chenango.
5. In passing from the Canacadea Valley to that of the Genesee.

6. In crossing the summit between the Genesee and Alleghany.

7. In descending to Lake Erie.

Independently of the points above specified, it will be observed that a very marked difference exists in the character of the lines surveyed between the Hudson River and the Delaware at the mouth of the Callikoon Creek, and the lines traced west of this point. Some changes, attended perhaps with material improvements, will probably be made in the Eastern Division of the Road, but it is not believed by the Chief Engineer of the work, that the character of the Railroad east of the Delaware, compared with its Western Division, can be essentially changed. The graduation of the latter, except at the points above noted, will very rarely if at all exceed twenty-five feet per mile. On the Eastern Division, grades of forty-five, and perhaps fifty feet must, in some cases, be admitted. On the Western Division, the radius of curvature will but rarely be less than two thousand feet. On the Eastern, it will often be from seven to nine hundred, and sometimes as short as six hundred.

It seems, under the circumstances, necessarily to follow, that the same description of engines can scarcely be expedient throughout the whole extent of the Railroad; that, whatever may be the load of a locomotive which it may be most judicious to look forward to, an engine of higher power will be required for its transportation east of the mouth of the Callikoon, than will be necessary west of it; and, as a consequence, that, whatever kind of superstructure may be adopted on the Western portion of the Railroad, one adapted to the use of engines of a higher class, will be advisable on the Eastern.

The undersigned, after a careful consideration of the subject, would recommend for the portion of the Railroad west of the mouth of the Callikoon, as being sufficient, and more economical than any other, a superstructure of wood and iron, consisting as usual of the cross-sill, the longitudinal wooden rail, and the plate rail, and framed in the usual manner by notches and keys. Such a superstructure, for a single track, executed in a superior manner, would cost about THREE THOUSAND DOLLARS PER MILE, and would admit of the use of locomotive engines of six tons weight, and capable of drawing on the level parts of the Road, loads of sixty tons, at the rate of seventeen miles per hour; or on grades of twenty-five feet per mile, the same loads at a speed of seven or eight miles.

To transport such loads, at a somewhat diminished speed, on the steeper portions of the Eastern Division, would require engines of eight tons, and this weight of locomotive the undersigned deem it most expedient to employ on this portion of the Railroad. To sustain the action of such a locomotive, the plate rail does not appear to be adequate. It will be more judiciously determined after the definitive location of the Railroad, what form of bar, and what mode of securing it, will be best adapted to the character of the road-way which may be obtained. It will be sufficient at this time to say, that the malleable bar or edge rail will be requisite between the mouth of the Callikoon and the Hudson. If, on a definitive location, the line between these points should be materially relieved as to curvature, a rail nearly similar in its section to that on the Camden and Amboy Railroad, but weighing about fifty pounds to the yard, will probably be most expedient. If not, it

will be advisable to adopt, at least on the curved parts of the Road, a rail of such form as may be more easily and accurately sprung into the curves adopted at different points on the road-way.

It has been deemed thus far necessary to explain the views of the undersigned, as to the weight and power of the engines which they would recommend on the Eastern and Western portions of the Road, before entering on the subject of the increased power requisite at the points they have specified. Their views on this subject they will now briefly explain.

On a line of Railroad, as long as that committed to the Board, it will be expedient to contemplate at any rate, several changes of locomotives. Even if a single engine could generally be relied on the whole distance from Hudson to Erie, still it would be advisable to provide for accidents; and it will probably prove more economical to change engines, and make the necessary repairs, before the wear and tear of the engine shall have progressed very far, than to reserve them entirely for workshops at the two extremes of the Road.

This being the case, it is obvious that whenever the stations at which engines would be changed, can be placed near the points at which extra power will be requisite, such power may be supplied more cheaply and conveniently than under any other circumstances. It will only be necessary to reduce the graduation at such points *within the scope of two engines*, and to make use of the engine which is relieved to assist that which is substituted for it, in overcoming the difficulty, and we have at once an extra power provided, which is always in readiness at the very moment when it is wanted, and which costs nothing except during the period it is employed.

For the 3d, 5th, and 6th cases above specified, it appears to us that no better expedient can be presented to the consideration of the Board than that above suggested. Stations being placed at or near the mouth of the Callikoon, in the neighborhood of Hornellsville, and at the commencement of the ascending graduation towards the summit, between the Genesee and Alleghany, it is proposed to change the engine at these points, and (whenever the load may not be so light as to render it unnecessary) to make use of the locomotive which is relieved, to assist in overcoming the increased ascent to be encountered.

At the Hudson (case No. 1) there would of course be a station, and probably at this point the principal workshop of the Company, so that whenever an additional engine was wanted in leaving the Hudson, it could be supplied without difficulty. It may be proper to remark, however, that in this case also, the principle above referred to for cases 3, 5, and 6, may be brought into play. If the train coming east should arrive at the Hudson a short time before the departure of that going west, the engine conveying it may be used before going into the workshop or engine-house, to assist the train going west, over the difficulty presented by the graduation at the commencement of its journey. A similar difficulty is now met in the manner suggested, on the Petersburg Railroad, in Virginia.—At the point of commencement of that Railroad at Petersburg, the ascent is for about two miles, at the rate of fifty feet per mile, whilst on the remainder of the Road, the ascent in no case exceeds thirty feet. The increased rate of ascent at this point, of course, often renders necessary additional power, and this is afforded when

wanted, by making use of the engine coming in, to assist in raising the train going out.

At case No. 4, that is, in crossing the summits between the Delaware and the Susquehanna, and Susquehanna and Chenango, auxiliary power will be requisite. By timing properly the passage of trains on this portion of the Road, a single engine which should assist alternately the trains going east and west over both summits, may in the commencement suffice.—It will be necessary, however, undoubtedly in a short time, to place auxiliary engines at the foot of the summit between the Delaware and Susquehanna, and west of that, between the Susquehanna and Chenango.

It remains to consider cases No. 2 and 7, or the passage of the Shawangunk mountain,—and the descent to Lake Erie.

Were those cases presented to the undersigned on a short line of Railroad, or were they to be treated without reference to the profile and general character of the New-York and Erie Railroad, the trade to be accommodated, and the power to be employed on it, we would unanimously recommend in each case an inclined plane. In the case however of the Shawangunk, it appears to us clear that this expedient would not be advisable. Independently of the general objections to inclined planes on a line of Railroad, on which the rapid transit of passengers and merchandize is desirable, (objections undoubtedly exaggerated in consequence of defects in arrangement and management in some of the planes now in use, but certainly to some extent well founded,) an inclined plane or planes at the point in question, *would not reach the whole difficulty*. It will be observed on reference to the profile of the line at this point, that after descending the Shawangunk, and passing the Basherskill, the line passes up the Neversink for upwards of seven miles, on a graduation averaging about fifty feet per mile; on this portion of the Road it will be important, if not indispensable, to supply some auxiliary power.

It is proposed, under these circumstances, instead of adopting an inclined plane for descending from the Shawangunk, to obtain by means of a tunnel of 900 yards, such a reduction of the elevation to be overcome, as will admit of the remainder being surmounted by a graduation not exceeding forty feet in curves, and one hundred feet per mile on the tangents of the line. On this ascent *two* of the heavy engines, which it is proposed to introduce on the Eastern Division of the Road, will ascend with the train which *one* would take over other portions of it.

By this expedient, and placing a station as in cases 3, 5, and 6, in the valley of the Basherskill, or the Neversink, the necessity of extra engines may at this point be avoided. Trains going east would change their engines at this station, and the engine relieved, instead of going at once into the engine-house or work-shop, would first assist in raising the train it had brought thus far up the Shawangunk. The same office would be performed by the engine which had brought on the train going west, up the steep graduation in the valley of the Neversink.

The descent to Lake Erie, would, on the line deemed by the Chief Engineer the most eligible of those surveyed, be effected principally by a single lift of 506 feet. Had an inclined plane or planes been found indispensable at the Shawangunk, it would not probably be advisable at this point to avoid,

by a graduation on which auxiliary power would be requisite, the plane which has been proposed. It will certainly however be a material object to get rid of the *only plane* in relation to which there appears to be a question on the proposed line of Railroad. Should it be found necessary to introduce it, either trains of cars must be divided in passing it, in which case much delay would arise, and the capability of the Railroad be seriously impaired; or, if the whole train were taken up at once, a strength and weight unnecessary on other portions of the Railroad must be given to the couplings of all the cars and carriages employed on the line, and of the locomotives and tenders which may ascend and descend the plane.

To avoid, if practicable, these inconveniences, it is recommended that farther examinations, preliminary to a location, be made between the Alleghany River and Lake Erie. If it shall result from them that a line, in other respects equal, and not exceeding in graduation fifty or sixty feet per mile, can be obtained between the summit and Lake Erie, the undersigned, under all the circumstances of the case, would deem it more advisable to adopt it, and to look to the use of auxiliary power on it, than to introduce the inclined plane which has been proposed.

A review of some of the experimental lines traced by the Chief Engineer in 1834, encourages us to believe that such a line may be practicable, and that the change of plan recommended may be attended with a reduction of distance of from eight to ten miles. If it should appear to be otherwise, or that an inclined plane or planes are unavoidable, the undersigned would then recommend, if ground suitable for the purpose can be obtained, a division of the elevation into two inclined planes. The capability of the Road would in this way be less impaired, the risk of serious accidents diminished, and the wear and tear, as well as first cost, of the rope or chain employed, materially lessened.

It will appear, on a review of what has been above stated, that *stationary power will not be requisite* on the line of the proposed improvement, unless in the neighborhood of Lake Erie, and future surveys may perhaps show that it can be dispensed with at this point;—that, by a judicious disposition of stations for changing engines, *one, or at most two, auxiliary engines only will be requisite* on the whole length of the contemplated work;—and that the load of an engine, at the rates of velocity which are purposed, (which will be equal to an average speed of from twelve to fourteen miles per hour,) will on both the Eastern and Western Divisions of the Railroad, be sixty tons gross; or, allowing thirty-three and one-third per cent. for the weight of cars, about *forty tons net*.

Should a higher velocity be deemed expedient, with a view to the better accommodation of the travel, there will be no difficulty in obtaining it, by a corresponding diminution of tonnage. Supposing a reduction of one-half in the weight of the load, or the useful effect of a locomotive, this would still be equivalent to the transportation of *two hundred passengers and their baggage*.

The above results are certainly more favorable than we should have anticipated, from the general character of the country through which the proposed improvement is to be conducted, and will probably be considered by the Board of Directors as affording additional inducements towards

the prosecution of the important work committed to their charge.

Referring for an elucidation of their views herein submitted, to the Report of the Chief Engineer of the 20th January last, and the accompanying plans and profiles,

We have the honor to be, gentlemen,  
Your obedient servants,  
MONCURE ROBINSON,  
JONATHAN KNIGHT,  
BENJAMIN WRIGHT.

New-York, September 2, 1835.

BALTIMORE AND OHIO RAILROAD.—It is gratifying to be able to state that the business of this Pioneer in the Railroad system of the United States is rapidly increasing; and that it will soon become as profitable to its Stockholders as it is now useful to the business community through which it passes.

In the 7th Annual Report it was stated that the net proceeds for the year ending October 1, 1833, was \$57,195  
In the 8th, ending October 1, 1834, was \$72,574

In the 9th, as we are informed, not having yet received it, for the year ending October 1, 1835, was \$107,163

This is a regular increase, and one which will be constant—even if the Road should not be extended beyond its present termination. The progression, however, will be much more rapid when the Road shall be completed to the Ohio River—as it most surely will be. We are enabled also to state another fact which is highly creditable to the enterprising and scientific gentlemen who manage that Road. It is, that to such a degree of perfection have they brought their Machinery, especially their Locomotive Engines, that they have with a single Engine taken a load of 113 tons up a grade of 20 feet per mile at the rate of *ten miles an hour*, and not only to *take it up*, but also, to take it from the *start*, on the grade, without difficulty—a performance which was not dreamed of in 1829, when the Liverpool and Manchester Company offered £500 for the most improved Locomotive of six tons weight, “which must be able to draw, day by day, on a well levelled Railway, a train of carriages of 20 tons gross weight, at the rate of *ten miles per hour*”!! Who could have imagined, with this before them, that in less than six years an Engine would be made in this country capable of taking *one hundred and thirteen tons*, at the rate of ten miles an hour, up a grade of 20 feet per mile? Such, however, is the *fact*—and we predict that it is only the commencement of the improvements in Railroad Machinery, which are now, *even now*, in progress in the United States.

It is indeed true that more rapid improvements have been made in this country in Railroads and Railroad Machinery, than in the country of their origin—England—and it is no less true, that Europe is now looking with much interest to this country for

improvements of this kind. Will it be presumptuous to say that we shall be able soon to give them important lessons in the science? We shall see.

IMPORTANT DECISION.—By the annexed article from the Albany Argus of yesterday, it will be seen that the mode and extent of enlarging the canal have been determined, and that the “improvement” of an existing work, is to cost at least *twelve millions of dollars*—the original work itself having cost a little over nine millions.

ENLARGEMENT OF THE ERIE CANAL.—The Canal Board having caused surveys and estimates to be made for the improvement of the Erie Canal, and the engineers having submitted their reports, the Board on Friday last proceeded to a final decision on the extent of the enlargement. By their resolutions, which are annexed, it will be seen that the enlarged canal is to be seven feet deep and seventy feet wide at the surface; and that the locks are to be 110 feet long between the quoin posts, and 16 feet wide in the clear. The present canal is four feet deep and forty feet wide at the surface, and the present locks are 90 feet long between the quoin posts, and 15 feet wide in the clear.

Thus, this great question has been definitely settled, after mature deliberation, and a full expression of the public sentiment in relation to it. As the work will be prosecuted chiefly during the winter months, and while the navigation is suspended, its completion cannot be expected in a less period than ten or twelve years. Then, with its increased width and depth, its walled sides, its extent, and its vast commerce, it may rank among the wonders of the age. The improvement, we understand, is estimated to cost about twelve millions of dollars. The Canal Board will proceed with the doubling of the locks, with all practicable rapidity, during the next winter.

At a meeting of the Canal Board, at the Comptroller's Office, Canal Room, October 23d, 1835—Present,

JOHN TRACY, Lieut. Gov., President,  
SAMUEL YOUNG, Canal Commissioner,  
WM. C. BOUCE, do.  
JONAS EARLL, jr., do.  
JOHN BOWMAN, do.  
A. C. FLAGG, Comptroller,  
JOHN A. DIX, Secretary of State,  
GREENE C. BRONSON, Attorney General,  
WM. CAMPBELL, Surveyor General,  
ABRAHAM KEYSER, Treasurer.

The Board having assembled pursuant to the 10th resolution adopted in July last, in relation to the enlargement of the Erie Canal, and having heard the reports of the Engineers as to the best mode of effecting the improvement, and their estimates of the cost of the contemplated works, thereupon

Resolved, That the *fifth* and *sixth* resolutions of July last be rescinded.

Resolved, That the Canal be enlarged so as to give seven feet depth of water, and in general seventy feet width of water on the surface, with a slope of two feet to one in the banks.

Resolved, That the Locks be enlarged so as to be one hundred and ten feet long between the quoin posts, and sixteen feet wide in the clear, and in other respects be adapted to the enlarged Canal.

Resolved, That whenever it shall be necessary to rebuild any of the locks, culverts, aqueducts or other works on the canal, the same be constructed on a plan adapted to the enlarged Canal.

An extract from the minutes.

G. W. NEWELL, Clerk.

AMERICAN STOCKS, Sept 24.—New York 6 per Cents. 1837, 96; do 6 per Cent. 1845, 102; do 6 per Cent. 1845, 110; Pennsylvania 5 per Cents. 1856, 101; do 5 per Cents. 1858, 102; do 5 per Cents. 1860-62, 102 1-2; Ohio 6 per Cents. 1850, 110 a 111; Louisiana Barings, 1844, do 1846, do 1850, do 1852, each 101 1-2; Louisiana Wileage, 1834, 1839, 1844, 1849, each 98 1-2; Jersey N. NEW-YORK AMERICAN.

OCTOBER 24—30, 1835.

LITERARY NOTICES.

AN ESSAY ON THE RATE OF WAGES, &c. BY H. C. CAREY, 1 Vol.—Philadelphia, CAREY, LEA & BLANCHARD.—We have had this book on our table some time, but as it is not of those, which you may take up at any moment—but requires close and continued attention, we have not yet been able to speak of its merits, and only now acknowledge the receipt of it—reserving for another occasion our opinion of its value.

THE ABORIGINAL PORT FOLIO, No 5—Philadelphia, J. D. LEWIS.—We have duly noted the appearance of the preceding numbers of this work, and in announcing the fifth, have only to repeat our commendation of the design of the publication—destined as it to perpetuate both the features, and costumes, of men fast fading away. We cannot but wish however, that more skill were exercised in the drawing, which, in this number particularly, is very defective.

NORTH AMERICAN HERPETOLOGY, or a description of the reptiles inhabiting the United States, by JOHN EDWARDS HOLBROOK, M. D., Professor of Anatomy in the Medical College of South Carolina, &c. &c.; Charleston, S. C., E. J. VAN BRUNT.—This is indeed a beautiful work, and worthy of encouragement, by every lover of nature and science. The plates, as yet, are only before us, but they are admirable for truth and accuracy of delineation and coloring—and when these shall be illustrated, as they will be, by the history of each reptile, its form and habits, from the pen of Dr. Holbrook, they will constitute an American contribution to natural history, and to the fine arts, worthy to be ranked with *Wilson's* and with *Audubon's* ornithologies.

The publication will consist of four quarto volumes, to appear annually, of 200 pages each, embracing full descriptions of the organization, habits, and localities of the animals, and containing in each volume from 20 to 30 colored engravings.—The price per volume is \$10.

We are sure this work is not at all known among us—and therefore take pleasure in thus bringing it to the notice of our readers, and shall be very glad to receive subscriptions for it at this office, where the plates of vol. I. may be seen.

SKETCHES OF HISTORY LIFE AND MANNERS IN THE WEST; by JAMES HALL, 2 vols. Philadelphia, HARRISON HALL.—The title of these volumes well describes their contents, which are of great interest—and we will venture to add—to most readers on the Atlantic of equal novelty. The early history, adventures, and struggles of the now civilized and prosperous West, are very imperfectly understood among us; and the desultory sketches which Mr. Hall has, in these volumes, given, are the more interesting, from the contrast of the actual condition of that fine region, with what it was, at the period to which the greater portion of the Sketches refer. We make an extract characteristic in all respects.

There have been many instances of individuals who, in consequence of some personal wrong, have vowed eternal enmity to the whole Indian race, and have devoted nearly all of their lives to the fulfilment of a vast scheme of vengeance. A familiar instance is before us in the life of a gentleman, who was known to the writer of this article, and whose history we have often heard repeated by those who were intimately conversant with all the events. We allude to the late Colonel John Moredock, who was a member of the territorial legislature of Illinois, a distinguished militia officer, and

a man universally known and respected by the early settlers of that region. We are surprised that the writer of a sketch of the early history of Illinois, which we published some months ago, should have omitted the name of this gentleman, and some others, who were famed for deeds of hardihood, while he has dwelt upon the actions of persons who were comparatively insignificant.

John Moredock was the son of a woman who was married several times, and was as often widowed by the tomahawk of the savage. Her husbands had been pioneers, and with them she had wandered from one territory to another, living always on the frontier. She was at last left a widow, at Vincennes, with a large family of children, and was induced to join a party about to remove to Illinois, to which region a few American families had recently removed. On the eastern side of Illinois there were no settlements of whites; on the shore of the Mississippi a few spots were occupied by the French; and it was now that our own backwoodsmen began to turn their eyes to this delightful country, and determined to settle in the vicinity of the French village. Mrs. Moredock and her friends embarked at Vincennes in boats, with the intention of descending the Wabash and Ohio rivers, and ascending the Mississippi. They proceeded in safety until they reached the Grand Tower on the Mississippi, where, owing to the difficulty of the navigation for ascending boats, it became necessary for the boatmen to land, and drag their vessels round a rocky point, which was swept by a violent current. Here a party of Indians, lying in wait, rushed upon them, and murdered the whole party.—Mrs. Moredock was among the victims, and all her children, except John, who was proceeding with another party.

John Moredock was just entering upon the verge of manhood, when he was thus left in a strange land, the sole survivor of his race. He resolved upon executing vengeance, and immediately took measures to discover the actual perpetrators of the massacre. It was ascertained that the outrage was committed by a party of twenty or thirty Indians, belonging to different tribes, who had formed themselves into a lawless predatory band. Moredock watched the motions of this band for more than a year, before any opportunity suitable for his purpose occurred. At length he learned that they were hunting on the Missouri side of the river, nearly opposite to the recent settlements of the Americans. He raised a party of young men and pursued them; but that time they escaped. Shortly after, he sought them at the head of another party, and had the good fortune to discover them one evening, on an island, whither they had retired to encamp the more securely for the night. Moredock and his friends, about equal in number to the Indians, waited until the dead of night, and then landed upon the island, turning adrift their own canoes and those of the enemy, and determined to sacrifice their own lives, or to exterminate the savage band. They were completely successful.—Three only of the Indians escaped, by throwing themselves into the river; the rest were slain, while the whites lost not a man.

But Moredock was not satisfied while one of the murderers of his mother remained. He had learned to recognize the names and persons of the three that had escaped, and these he pursued with secret, but untiring diligence, until they all fell by his own hand. Nor was he yet satisfied. He had now become a hunter and a warrior. He was a square-built, muscular man, of remarkable strength and activity. In athletic sports he had few equals; few men would willingly have encountered him in single combat. He was a man of determined courage, and great coolness and steadiness of purpose. He was expert in the use of the rifle and other weapons; and was complete master of those wonderful and numberless expedients by which the woodsman subsists in the forest, pursues the footsteps of an enemy with unerring sagacity, or conceals himself and his design from the discovery of a watchful foe. He had resolved never to spare an Indian, and though he made no boast of this determination, and seldom avowed it, it became the ruling passion of his life. He thought it praiseworthy to kill an Indian; and would roam through the forest silently and alone, for days and weeks, with this single purpose. A solitary red man, who was so unfortunate as to meet him in the woods, was sure to become his victim; if he encountered a party of the enemy, he would either secretly pursue their footsteps until an opportunity for striking

a blow occurred, or, if discovered, would elude them by his superior skill. He died about four years ago, an old man, and it is supposed never in his life failed to embrace an opportunity to kill a savage.

The reader must not infer, from this description, that Colonel Moredock was unsocial, ferocious, or by nature cruel. On the contrary, he was a man of warm feelings, and excellent disposition. At home he was like other men, conducting a large farm with industry and success, and gaining the good will of all his neighbors by his peculiar manners and benevolent deportment. He was cheerful, convivial, and hospitable; and no man in the territory was more generally known, or more universally respected. He was an officer in the ranging service during the war of 1813—14, and acquitted himself with credit; and was afterwards elected to the command of the militia of his county, at a time when such an office was honorable because it imposed responsibility, and required the exertion of military skill. Colonel Moredock was a member of the legislative council of the territory of Illinois, and at the formation of the State government, was spoken of as a candidate for the office of governor, but refused to permit his name to be used.

YARROW REVISITED, AND OTHER POEMS; by WILLIAM WORDSWORTH; 1 vol. New York, R. BARTLET & S. RAYNOR.—The Poet gives life and interest to all he touches, and hence even these poems of Wordsworth, which for the most part, are local in their subjects, are yet universal in attraction, by the inspiration with which they are touched. We select one, from the "Evening Voluntaries":

Not in the lucid intervals of life  
That comes but as a curse to party-scrifa;  
Not in some hour when pleasure with a sigh  
Of languor, puts his rosy garland by;  
Not in the breathing-times of that poor slave  
Who daily piles up wealth in Mammon's cave,  
Is nature felt, or can be; nor do words,  
Which practised talent readily affords,  
Prove that her hand has touched responsive chords,  
Nor has her gentle beauty power to move  
With genuine rapture and with fervent love  
The soul of genius, if he dares to take  
Life's rule from passion, craved for passion's sake;  
Untaught that meekness, is the cherished bent  
Of all the truly great, and all the innocent.  
But who is innocent? By grace divine,  
Not otherwise, O nature! we are thine,  
Through good and evil thine, in just decree  
Of rational and manly sympathy.  
To all that earth from pensive hearts is stealing,  
And Heaven is now to gladdened eyes revealing,  
Add every charm the Universe can show,  
Through every change its aspects undergo,  
Care may be respite, but not repealed;  
No perfect cure grows on that bounded field,  
Vain is the pleasure, a false calm the peace,  
If he, through whom alone our conflicts cease,  
Our virtuous hopes without relapse advance,  
Come not to speed the soul's deliverance;  
To the distempered intellect refuse  
His gracious help, or give what we abuse.

SECRET COUNSELS OF THE SOCIETY OF JESUS IN LATIN AND ENGLISH, to which is prefixed a discourse on the authenticity of the work by ROBT. J. BRECKENRIDGE. 2nd American edition. Baltimore, J. COALE & Co. The Rev. Mr. Breckenridge is a man of talents and of high character. His object in ushering before the public this very curious pamphlet, with his sanction for its authenticity, is to put the people of America on their guard against the principles which, even in Europe, have banished the *Jesuits* from every nation. It is a strange and awful record, if true, or any thing like true, and if false or interpolated, it should be shown to be so. It is dedicated—as a sort of defiance we presume—to the Catholic Archbishop of Baltimore, who is called upon as a "gentleman, a scholar, and a Christian" to refute it, if false, or to admit its authenticity, if true.

THE LIFE OF ADMIRAL VISCOUNT ESMOUTH, by EDWARD OSLER, Esq., 1 Vol.—London, SMITH, ELDER & Co.—New-York, WM. JACKSON.—The lives of great commanders, whatever their nation, have a charm for most readers, and particularly for young ones. That of the gallant conqueror of Algiers, will not be found to lack the accustomed interest. It is a narrative of steady application to

his profession, ardent zeal, and deserved success. It is truly characterized by one of his own sayings.

"I have never known what fortune meant. I never chose my station, and never had a friend but the king's pennant; but I have always gone where I was sent, and done what I was ordered; and he who will act upon the same principles, may do as I have done."

**THE KNICKERBOCKER** for October; New York, WILEY & LONG.—Though late in the field, this month, this number is welcome, for many merits. It has indeed exceedingly clever papers on several subjects; from one of which, "an old man's Records," we make a striking extract, conveying a true story.

The first execution that I ever witnessed, was in London. I was also, by accident, a spectator of the dreadful deed which brought the wretched criminal to the gallows. I proceed to give a description of both the culprit and his act; of the causes which made him the former, and brought about the latter. All the scenes of this extraordinary and romantic catastrophe arise to my mind as vividly as if they had happened but yesterday.

On the evening of the seventh of April, 1779, I left my lodgings in the Strand, at an early hour, for Covent Garden Theatre. The house was filling, as I sought my box. The play was *Love in a Village*, and the cast for the night embraced some of the then most popular performers of the day.—There was a continual influx of beauty and fashion, until the dress circles assumed an appearance of absolute splendor. Plumes waved; jewelled hands lifted the golden-bound glass to the voluptuous eye; and all the pomp and circumstance of a brilliant auditory garnished the scene. One "taken" box still remained without its occupants; but at the close of the first act, they entered. A middle aged, but fine-featured and cheerful-looking gentleman, with an Irish physiognomy, handed into her place a lady of such surpassing loveliness, that,—the first glance being taken,—I could scarcely withdraw from her the patronage of my eye. She was dressed in the magnificent fashion of her time; her hair parting off from her temples and forehead like a wave, and falling in two large masses on either side of her polished neck. Her brow was high and clear; her eyes of heaven's own azure; her nose had the fair lines and nostril-curve of Greece; her cheeks and chin softly dimpled, and her ruby lips wearing "a smile, the sweetest that ever was seen." The dazzling creature took her place and adjusted her scarf with inimitable gracefulness. Her dress I well remember was in the height of taste; the white lace ruffles of her short sleeves terminating at the elbows, and showing the perfect symmetry of her hand and arm, as she plied her pretty fan, or peered through her glass at the *Pride of the Village*. I was quite overcome with admiration.

"Pray who can that be?" said I to a friend.

"What a question?" was the reply. "How ignorant you are! Not to know her argues yourself unknown. That is the splendid Miss REAY—the fair friend of Lord Sandwich, who is her protector. He has given her the protection that vultures give to lambs. She has borne him two or three lovely, cherub-like children. He is twice her senior in years,—has robbed her of her best treasure,—and it is strongly whispered that she loves him not. When in public, as at present, she is usually without him."

I did not prolong my inquiries, for the lady herself attracted my sole attention, to the utter disregard of the play. As I was gazing in that direction, I saw a person standing at the door of a box, near by, whom at the first glance I took for a maniac. His eyes glared with unsettled wildness; his pace was pale as death, and the damp hair hung in heavy threads over his forehead. He was looking at Miss Reay with an expression in which love and hate seemed to struggle for empire. He was well sized, handsome, and of goodly presence. He was dressed in black. I never beheld a countenance in which so much mental excitement was depicted. His lived lip moved as if in a kind of prayer: he would sometimes press his hand against his forehead or his heart; and finally, after a long and lingering look at the lady I have mentioned, raised his handkerchief hurriedly to his eyes, and disappeared.

I never remember to have passed an evening in

such perfect abstraction as this. The intoxication of beauty overpowered me; and so rapt had been my attention, that I scarcely knew when the play was over. I hurried out as soon as the curtain fell, and stepping to the Piazza, waited to see the fair creature enter her carriage. She passed by me, with her attendant, his epaulettes glittering in the lamp-light. A kind of enchantment possessed me, and a foreboding that some doleful disaster was about to happen. I was moving onward, and stood within a few feet of the lady, when I heard the loud and stunning report of a heavily charged pistol.—Another followed—and shrieks and groans resounded along the arches. I rushed towards the spot whence the deadly sounds proceeded, and found the brilliant being whom I have described, weltering in blood. The ball had entered her fair forehead, and her vestments were deluged with gore. The sight was horrid beyond description. She was perfectly dead. I penetrated the crowd that had surrounded the murderer. It was the same person that I had noticed in the theatre, and whose looks were so desperate. His face was white as snow; his eyes dilated, and his lips compressed; but his demeanor evinced a kind of peaceful tranquility, or dead stupor; the awful calm that follows a tempest of passion. The blood, and even portions of the brain of his victim were on his sleeve. Never shall I forget the terror of that scene! He had attempted immediately after killing Miss Reay, to destroy his own life; but his murderous weapon failed in its effect, and he stood mute before the multitude a personification of immovable Horror.

I returned to my lodgings, but sleep fled from my eye-lids. The excitement of fixed attention during the evening, and the awful catastrophe I had witnessed, left me in a state of dread, and nervous feeling. If I slumbered, my slumbers were not sleep, but a continuance of melancholy scenes and impressions.

The next day, all the events which led to the deplorable deed I had witnessed, were brought to light. The murderer was a young clergyman, named *James Hackman*. He was formerly an officer in one of the British regiments; and being invited on one occasion to dine with Lord Sandwich at Hinchbrook House, he met Miss Reay, and soon became so desperately enamored of her as to weaken his health. He finally,—more probably for the purpose of being near the object of his love, than for any other cause,—left the army, took holy orders, and obtained the living of Wiverton in Norfolk.

Perhaps a more affecting and melancholy termination of unlawful love never occurred than this. Miss Reay had little or no affection for the nobleman who had so foully wronged her; and the first object of her passion was undoubtedly the young military clergyman. In the course of time he completely won her heart, and alienated her regard, if any she had, entirely from her first lord. He ultimately removed to Ireland; and on his return found the heart of his versatile mistress changed forever, and in favor of a third admirer. While, however, in the mutual "tempest, torrent, and whirlwind of their passion,"—while he was in the constant course of dishonoring the man whose hospitality he had so often enjoyed, (if dishonor it may be called, under the circumstances,) the epistles which the parties addressed to each other, breathe the very soul of feeling. Never, perhaps, was there a more awful exemplification, than in the case of these short-lived lovers, of the truth of Shakespeare's lines:

"These violent delights have violent ends,  
And in their sweetness die."

During the lover's sojourn in Ireland, he wrote to his mistress, and in doing so, spoke unwittingly of pleasant female acquaintances that he had formed in that kingdom. This, I have reason to believe, was the first impulse to her estrangement. Her previous letters to him had been overflowing with affectionate sentiments. In one of them, speaking of her devotion, she says,—"I could die, cheerfully, by your hand,—I know I could." The letter to which I have just alluded, however, provoked the following reply:

England, 25th June, 1776.

"To Mr. ——. Let me give you joy of having found such kind and agreeable friends in a strange land. This account you gave me of the lady quite charmed me. Neither am I without my friends. A lady from whom I have received particular favors, is uncommonly kind to me. For the credit of your side of the water, she is an Irish woman.

Her agreeable husband, by his beauty and accomplishments, does credit to this country. He is remarkable, also, for his feelings.

"Adieu! This will affect you, I dare say, in the same manner that your account affected me."

This letter, with others that followed it, soon brought Mr Hackman to London. He lodged, on his return, in Cannon's Court, and addressed an immediate letter to his mistress. The answer returned, purported to come from a female servant, writing by the sick bed of her lady, and at her dictation. The epistle was humbly written, and filled with prevarication and cold compliments. By degrees, the melancholy truth of the lady's estrangement was established. Proof of the most positive description was furnished. It drove the lover to despair—and he resolved on self-destruction. Information having been communicated to him at his parsonage at Norfolk, (whither before the full proof of his suspicions he had retired,) calculated to awaken every dark surmise, he hastened to London, where every thing was confirmed. In his first tumultuous resolve for self murder, he expressed his fears in a letter to a friend as follows: "My passions are blood-hounds, and will inevitably tear me to pieces. The hand of nature has heaped up every species of combustible in my bosom. The torch of love has set the heap on fire, and I must perish in the flames. And who is he will answer for passions such as mine? *Al present, I am innocent.*" His last letter before committing the deed for which he suffered an ignominious death, was addressed to a friend, and couched in the following terms:

7th April, 1779.—"To Mr. B——, My dear F——. When this reaches you, I shall be no more—but do not let my unhappy fate distress you too much. I strove against it as long as possible, but it now overpowers me. You know where my affections were placed; my having by some means or other lost her's, (an idea which I could not support,) has driven me to madness.—God bless you, my dear F——. Would I had a sum of money to leave you, to convince you of my great regard! May heaven protect my beloved woman, and forgive the act which alone could relieve me from a world of misery I have long endured! Oh! should it be in your power to do her an act of friendship, remember your faithful friend,  
J. H."

In the afternoon of the day on which the preceding letter was written, Mr. Hackman took a walk to the Admiralty, from his lodgings in St. Martin's Lane, probably to take a last view of worldly objects, ere he plunged into the great gulf of Eternity. Near the Admiralty, he saw Miss Reay pass in a coach, with Signora Galli, an attendant. He rushed into the Theatre, in the desperate condition I have before described; and unable to control his thick-coming and bitter thoughts, returned to his lodgings, where he procured and loaded the pistols, with one of which he committed his dreadful crime. In his attempt to kill himself after Miss Reay, he was severely wounded. Mr. McNamara, a gentleman who was assisting the lady into the coach, was so covered with blood, and filled with horror, that he was seized with violent sickness.—The mangled remains of the "Beauty once admired," were conveyed to the Shakespeare tavern, near the theatre, to await the coroner's inquest.

The unhappy clergyman was conveyed to Newgate, whence he addressed the ensuing note to a friend:—

8th April, 1779.—"To CHARLES —, Esq. I am alive, and she is dead. I shot her and not myself. Some of her blood is still upon my clothes. I don't ask you to speak to me. I don't ask you to look at me. Only come hither, and bring me a little poison; such as is strong enough. Upon my knees I beg, if your friendship for me ever was sincere, do, do bring me some poison!"

This was not furnished him—and his trial soon came on. I was present. The prisoner sat with his white handkerchief at his cheek, his head resting languidly on his hand. His face wore the gloomy pallor of the grave. The plea of insanity, put in by his counsel, did not avail. When he rose to offer his defence, many an eye glistened with the tears of pity. His words, hollow and sepulchral in their sound, seemed to come forth without their breath from his livid lips; while a large dark spot on his forehead seemed like a supernatural seal of ruin. His defence was brief, clear, and pointed. In the course of it he said: "I stand here this day the most wretched of human beings; but I protest, with that regard to truth which becomes my situa-

tion, that the will to destroy her who was ever dearer to me than life, was never mine, until a momentary frenzy overcame me, and led me to the deed I now deplore. Before this dreadful act, I trust nothing will be found in the tenor of my life, which the common charity of mankind will not excuse. I have no wish to avoid my punishment." This state of mind prevailed to the last. He hungered and thirsted for death. Lord Sandwich addressed him, anonymously, the note subjoined, to which I annex the reply:

"17th April, '79.—To Mr. Hackman, in Newgate: If the murderer of Miss — wishes to live, the man he has most injured will use all his interest to procure his life."

"The Condemned Cell in Newgate, Saturday Night, 17th April, 1779.—The murderer of her whom he preferred, far preferred to life, suspects the hand from which he has just received such an offer as he neither desires nor deserves. His wishes are for death, not for life. One wish he has: Could he be pardoned in this world by the man he has most injured? Oh my Lord, when I meet her in another world, enable me to tell her, (if departed spirits are not ignorant of earthly things,) that you forgive us both, and that you will be a father to her dear infants! J. R."

The rest of his time was passed in a state of mind almost too horrible to relate. Among his writings, were such records as these: "Since I wrote my last, I caught myself marching up and down my cell, with the step of haughtiness; hugging myself in my two arms, and muttering between my grating teeth—*what a complete wretch I am!* The clock has just struck eleven. The gloominess of my favorite Young's Night Thoughts, which was always so congenial to my soul, would have been still heightened, had he ever been wretched enough to hear St. Paul's clock thunder through the still ear of night, in the condemned walls of Newgate. The sound is truly solemn—it seems the sound of death. Oh that it were death's sound! How greedily would my impatient ears devour it! And yet, but one day more. Perturbed spirit!—rest till then!"

His dreams were tumultuous and dismal. In one vision, he saw himself in perdition, and having a distant view of Heaven, beheld his adored mistress walking with angels, and looking down with a look of peace and joy upon his miseries. She did not seem to know of them. "I could not go to her, nor could she come to me: nor did she wish it—there was the curse! Oh, how I rejoiced, how I wept and sobbed with joy, when I awoke and found myself in the condemned cell of Newgate!"

He met his fate at the scaffold with the firmness of despair. Only two or three years before, the criminal had attended the execution of the celebrated Dr. Dodd. I employ his very description of that scene, as a complete simile of that which attended his own death, as witnessed by me; and with it, close the melancholy tale: "At last arrived the fatal moment. The driving away of the cart was accompanied by a noise which best explained the feelings of the spectators for the sufferer. Did you never observe, at the sight or the relation of any thing shocking, that you closed your teeth hard, and drew in your breath hard through them, to make a sort of hissing sound? This was done so universally at the fatal moment, that I am persuaded the noise must have been heard at a considerable distance. For my own part, I detected myself, in a certain manner, accompanying his body with my own."

His agony was soon over, and his cold form conveyed to its last couch of silence and oblivion.

FABULAS EN VERSO CASTELLANO, por Don F. M. SAMANIEGO. New York.

DIOS ES EL AMOR MAS PURO, por ECKARTSHAUSEN. 9 Edicion. New York.

EL AMIGO DE LOS NIÑOS traducido al Castellano por D. JUAN DE ESCOBICAZ. New York.

CHARLES XII., por VOLTAIRE. 6me. edition, revue et corrigée par C. L. PARMANTIER, Professeur de langue et de littérature Françaises à l'Université de New York. New York.

ŒUVRES CHOISIES DE JEAN RACINE. 1 edition Americaine, revue et corrigée par C. L. PARMANTIER, Professeur, &c. New York.

ricaine, revue et corrigée par C. L. PARMANTIER, &c. &c. New York.

ELEMENTS DE LA GRAMMAIRE FRANÇAISE, par L'HOMOND, Professeur, &c. New York.

All these school books, destined for the use of young persons learning Spanish and French, are from the press of Charles De Behr, of this city.—They are unexceptionable in character, and cheap in price.

THE PENNY CYCLOPEDIA, Vol 2.—AN to AT—London, CHAS. KNIGHT—New-York, WM. JACKSON.—This second volume of this cheap and comprehensive Cyclopaedia, is just completed, and commends itself in that shape to general circulation.

#### EUROPEAN INTELLIGENCE.

LATER FROM EUROPE.—By the packet ship *Independence*, from Liverpool, we have our London files to the 26th ult.

English and French affairs, in the absence of the Legislative bodies of the two countries, both of which adjourned some time ago, are of little general interest. The Spanish quarrel now is the chief subject. A rumored worsening of the British auxiliaries—of which we had some pretended details by the way of *Havre* yesterday, turns out to be unfounded—as by our extract from Bayonne will be seen.

The French government have, it is confidently said, given assurances to the Spanish Cabinet that "in no event should a French army cross the Pyrenees."

The Paris dates are of the 24th. *Pepin* the reported accomplice of *Fieschi*, had been arrested anew.

Lord Durham, in the *Barham* frigate, arrived on the 2d in the outer harbor of Constantinople.

The *Toronto*, Capt. Griswold, which sailed hence on 2nd September, arrived in the Downs on the 19th.

The *Caledonia*, in which ship *Bowen*, of Custom House notoriety, was a passenger, had arrived.—Nothing of the pilot boat.

The morning Herald of 25th inst. has this paragraph.

The following is the postscript of our Paris letter, dated, "a quarter to Four o'clock, Wednesday, 23d.

"There are recent letters, in town, from Kalisch, which speak of the rise, at the sham fight in the early part of the month, as serious, and of the probability that the manœuvres would, in consequence, be curtailed. You will have observed that the Emperor Nicholas had arrived thither by Danzig, instead of Riga, as he had at first intended. The reason of this alteration of the intended route was the existence of a band of Polish outlaws in the woods near Riga. It no longer remains, however, for a *battai* having been ordered and made, the band was dispersed or hunted down. Its chief was arrested.

The population of Spain is 10,609,000 inhabitants. It is calculated that the provinces which have declared in favor of the Constitution have 7,986,000 inhabitants. If we add to these the 552,000 of the Biscayan provinces and Navarre, which have declared for Don Carlos, we shall find that the Queen's Government is supported by only 2,920,000 inhabitants out of the 10,609,000.—[French paper.]

The latest accounts from Milan, of the 5th, say that the Cholera had approached within a few miles of Milan. The Archduke Viceroy had declared his intention, as soon as a case of cholera should occur in Milan, to leave the Palace of Monza, and go to the capital. This resolution of the Prince, who is the father of a family, had made made a great impression in the city.

M. Pepin was arrested yesterday morning.—After a long search, the authorities succeeded in discovering that he had taken refuge at Magny, near Meaux, in the house of a farmer of that village. On Monday evening several police officers

were sent there from Paris, and at 4 o'clock yesterday morning the farm house was completely surrounded. Awakened by the noise, M. Pepin rose hastily, and was found only half dressed, in a back closet. He was immediately put into a post-chaise, and brought to Paris under a strong escort, and at two o'clock was locked up at the Conciergerie.

The *Sentinelle des Pyrénées* of the 19th instant, contradicts its preceding accounts of General Evans and 500 English prisoners having been shot by the Carlists.

The *Indicateur* of Bordeaux, in rendering an account of the action of Arrigorriaga on the 11th inst., states that during the action a whole company of the battalions of Castile, which are for the most part composed of Christino prisoners, went over to the Queen's troops.

BAYONNE, Sept. 17.—For the last day or two the Carlist agents at Bayonne have been actively circulating accounts of the defeat of the Anglo-Spanish army, on the 11th instant, in the neighborhood of Bilbao, and which reports have been inserted in the *Sentinelle* and *Phare* of Bayonne of this day; fortunately, by the arrival, at an early hour this morning, of authentic intelligence from Bilbao up to the 12th instant, received by the Spanish Consul and other persons, these infamous falsehoods have been contradicted. An action had, however, taken place on the 11th at Arrigorriaga, about two leagues from Bilbao, but in which the British Legion had taken no part whatever. The Spanish troops under General Espartero had been alone engaged, and that General is said to have been slightly wounded, and the loss on both sides had been nearly equal, from 300 to 400 men put *hors de combat*. The details of this affair had not transpired, but despatches from Col. Wyld were also received this morning by the Spanish Consul, for His Britannic Majesty's Ambassador at Paris. The abominable falsehoods hourly circulated by the Carlists render it almost impossible to procure correct information at this place; and before these falsehoods can be contradicted, several days must elapse before any authentic intelligence from the Queen's army can come to hand; and when it is recollected that the Carlist reports and bulletins stated the loss of the Queen's troops and British auxiliaries at the affair of Hernani, near St. Sebastian, on the 30th ult., at upwards of 1000 killed and wounded—when it is known as a positive fact to every inhabitant and individual in St. Sebastian that the loss of the Anglo-Spanish garrison did not amount on that occasion to one-tenth part of that number, viz. 13 killed, and from 70 to 80 wounded, it would be impossible to give credit to any future accounts or bulletins which the Carlists may think proper to issue of killed and wounded. The two battalions of French and foreign auxiliaries which have been assembling at Pau and Oleron, about 1,000 men in all, entered Spain a day or two ago, *via* Campfranc and Jaca, to join General Cordova. Considerable convoys of horses, and even of cattle, have lately passed the frontiers for the Carlists; indeed, it is quite clear that there is no difficulty in supplying them with every thing they require.—The Spanish Vice-Consul at Bayonne, the Chevalier d'Urraca, lately appointed, has been suspended from his functions by order of the Spanish Ambassador in Paris, awaiting the decision of the Spanish Government at Madrid thereon. No cause whatever has been assigned.

General Count Harispe, who has been residing lately at his country seat near St. Jean Pied de Port, is expected at Bayonne on Saturday.

LONDON CITY—EVENING, SEPT. 24.—The accounts which we have received from Madrid reach to the 18th September; from their contents we learn that M. Mendizabal, as we had previously stated, had received the commands of the Queen Regent to reorganise the Administration. M. Mendizabal's appointment as Finance Minister is confirmed; Las Heras is to be Minister of the Interior, *ad interim*, whilst it is expected that Gil Cuadra will eventually fill his place, with the support of General Alava and Senor Arguelles. In addition to these circumstances the tone of the private letters have been deemed here extremely favorable by the old Constitutionals of Spain. They confirm to a great extent our former statement, and afford strong countenance to the impression that the political modifications of the new Government will eventually tend to the future prosperity of the Spanish kingdom.

The address of M. Mendizabal to the Queen

has created no small attention here, in consequence of the absence of political bombast, considered to be the organ of assistance towards the Constitution; hence the confidence which has been displayed in his future financial plans. Other of our private letters inform us that arrangements were made for the disposal of the Church property, by which the present incumbents would receive a compensation in land devisable on their demise to their trustees. This arrangement was considered likely to conciliate, as so many Spanish families are engaged in religious occupation.

The tone of the British Money Market continues to wear a degree of firmness that for a long time has not been exhibited, and the purchases made by order of the Accountant-General to the extent of \$30,000 gave the market some degree of impulse; and this clearing out of Money Stock must practically ensure a steadiness in the Consol market. Consols closed to-night at 91 1-4 money, and 91 3-8 time. The New Three-and-a-Half per Cents are 98 3-8, and Omnium, 4 3-8. India Stock, 255 1-2, and Bank Stock, 211 1-2 for the opening.

**Boussas, Monday, Sept. 21.**—The Rents have again improved. The only probable cause of this is the rise in the English funds. The market is very firm. The Spanish Securities have risen considerably; the monied man seem to have a high opinion of the financial capacity of Mendizabal.

**LAST PRICES.**—Five per Cents, 107f. 90c.; Three per Cents, 80f. 60c.; Five per Cents, Spanish, 34 1-2.

**THE FOREIGN NEWS** received by the *Independence* on Saturday was very hastily given. We now add many details.

The address of *M. Mendizabal* to the Queen of Spain, before he was charged by her with forming a Cabinet, will be found among our extracts. The antecedents, and known opinions, of *M. Mendizabal* give assurance that all that can be done for liberal opinions in Spain, will be, by him. The *Journal des Debats* is not at all satisfied with *M. M.'s* appointment or doctrines. The English ministerial papers are much pleased with it. The Quadruple Alliance, however, between England, France, Portugal and Spain, for the restoration of order in the latter, seems virtually dissolved, since each of the three first named powers has now distinctly refused, when applied to in behalf of the young Queen, to interfere by force.

The camp at *Kalisch* had broken up, and the Sovereigns, including the Emperor of Austria, were about to meet in Congress at *Toplitz*. Concerning the objects of that meeting, much solicitude and jealousy are expressed in the English papers.

The news from Italy contained in these papers is not without interest. Alarm has been felt for the public tranquility, though on what ground is not stated; but it is noticed that a report is in circulation that the French Government has proposed to occupy several points in the Roman States.—Cardinal *D'Isaard* has arrived unexpectedly at Rome, on a secret mission, as is supposed, from *Louis Philippe*. The King of Naples has collected a large force for the ostensible purpose of reviewing it. The cholera still fills the Italians with anxiety; but at Rome it has had the good effect of inducing the people to conquer the habit of burying their dead in the churches of the city, and several burying grounds are preparing outside the walls. One was consecrated on the 3d ult. The services of Our Lady are as actively called into operation in Rome as in Bavaria and Spain, the dread of the cholera being apparently the principal motive for the increase of devotion. We quote the paragraph that it may speak for itself:—

"There is to be a great procession to implore Heaven to remove the evils which now afflict Christendom. An image of the Virgin Madonna della Neve, which has not been visible for many years will be carried in the procession to St. Peter's. The Pope, Cardinals, and Clergy will attend."—[*Allgemeine Zeitung*, Sept. 21.]

The German papers, mention that crowds of Italians have taken refuge in Bavaria from the cholera, and that Our Lady, who in Spain has to lead the armies of Don Carlos, in Bavaria is engaged to keep up a cordon of health, and preserve her faithful Bavarians from disease. Her votaries certainly require from her, important services in return for their worship.

A new minister to this country has been appointed, as by the annexed extract from the Royal Gazette will be seen.

**Foreign Office, Sept. 23.**

The King has been graciously pleased to nominate and appoint Henry Stephen Fox, Esq., now his Majesty's Envoy Extraordinary and Minister Plenipotentiary to his Majesty the Emperor of Brazil, to be his Majesty's Envoy Extraordinary and Minister Plenipotentiary to the United States of America.

An important item to our East India trade is thus announced.

**Thursday Evening, Sept. 24.**

**Money Market and City Intelligence.**—The desire which the merchants connected with Singapore have often expressed, that the American vessels should be allowed to trade between that settlement and the United States, as an important ameliorating feature in their commercial transactions, has at length been accomplished, as will be seen by the following answer from the President of the Board of Trade to an application on the subject from Mr. Thomas, which legally authorizes the opening of the trade:—

**Treasury Chambers, Sept. 1.**

"Sir,—Having laid before the Lords Commissioners of His Majesty's Treasury your letter of the 20 of May last, requesting their opinion on the subject of the right of the Americans to trade between the United States and Singapore, I am commanded by their Lordships to acquaint you, that, on an investigation of the subject, and a communication with the law officers of the Crown, they are advised that the Americans are legally authorized to trade between the United States, or any port of the United Kingdom, and Singapore, as also between the United States and any port of the British possessions in the East Indies.

I am, sir, your obedient servant,

**F. BARING.**

To Charles Thomas, Esq. 71, Connough-terrace.

Mr. O'Connell is making a progress of agitation throughout Great Britain. Passing through Northumberland into Scotland, he was entertained at Newcastle and afterwards at Edinburgh.—His great day, however, was at Glasgow, where, it being Monday, 200,000 operatives and others were assembled on the Green to greet him,—to whom he made a speech. A *soirée* followed, admission three shillings per head, for which, a cup of coffee, a slice of bread, and a bottle of whiskey punch, were supplied. Mr. O'Connell there spoke again, but the boys became uproarious before the play was out. The next day a great dinner was given, at which, "the sovereignty of the people," was drunk as the third regular toast, after the King and Queen. On Mr. O'Connell's health being proposed, he delivered a long speech, in which he avowed, that "his mission was to produce a reform in the House of Lords." Whether such eloquence and arguments as those we extract below, will prevail in the country, where the schoolmaster is said to be abroad, we do not undertake to judge.

Referring to the Lords, Mr. O'Connell said—

They put him very much in mind of a practice sometimes followed in his country, of taking off the ears of a pig, and greasing its tail, and then allowing it to become the property of the first person that could hold it. (Laughter.) There they are, the soaped and greased heads of society. (Cheers.) There they are, the real swinish multitude—(Loud cheers)—as ignorant and mulish as their prototypes. (Cheers.) There was a countryman once went from Kilcullen to Naas to purchase a pig—(A laugh)—well, he bought one, and as he was driving the pig from Naas to Kilcullen he met a friend, who asked him where he was driving it to;

he answered to Dublin; on which his friend said he was taking the road to Kilcullen. Silence, says the other, if the pig hears he's going to Kilcullen, he'll be off to Dublin in a minute. (Laughter.)—That was just like the House of Lords. (Great laughter.) Only let him (Mr. O'Connell) say he was for Dublin, and the Lords were off in an opposite direction. (Cheers.) This was literally the case with the Lords. There was Londonderry, snorting and squeaking—(laughter)—Winchelsea, piously groaning—(Loud laughter)—and Wellington, the swine-herd General. (Continued laughter.) There they floundered about in the mud, and if the people do not choose to submit to have the mud thrown on them, they must insist that a parcel of oxen shall not be arrayed in the panoply of armor, but that human beings shall fill their places; that swinish propensities be banished from among the rulers of the nation. (Cheers.) They have now made the House of Commons, the House, in a great measure, of the people. But the work is not finished. He never heard that Scotland was in the habit of leaving half done work. He had, as they said, in his country, a pretty notion that they didn't like half finished jobs. (Loud laughter.) Would they leave the piece in the loom half finished—would they on any pretence take a half hog for a man. (Cheers.) The Lords had driven us to this point. There would be no need for change if the Lords acted with sense, and went with us; but when they would only pay the people 10s. 6d. per pound of their just debt, they were telling us, as Anglesea once told him (Mr. O'Connell) agitate, agitate, agitate; and here we are taking their Lordships' advice. Having shown them the futility of reform unless we had a reform of the House of Lords; having shown them that there was no use of a Reformed House of Commons, if they were to have the Apsley House Divan, declaring that they would reject their measures, the toast he had to propose was "A speedy Reform of the House of Lords." (Hear, hear.) It was idle to congregate as they now did, and avow the necessity of a Reform in the House of Lords, if they were to fall asleep afterwards, without making any exertion for its accomplishment. No one could gain any advantage for his country, unless he continued the struggle. Down with the House of Lords—(Cheers)—and the present scheme of legislation. Down with the oligarchy. (Cheers.) Down with the Apsley House coterie. (Cheers.) Down with the swinish multitude. (Cheers.) They all agreed in this.

Mr. Osbaldeston, of sporting fame, has become the lessee of Covent Garden Theatre.

The French frigate *Didon*, mounting 60 thirty two pounders, with a picked crew of 465 men, had arrived at Plymouth, having for second Lieutenant the Prince de Joinville, third son of *Louis Philippe*. He was visited and received with royal honors.

The Duke de Nemours second son of *Louis Philippe*, had completed his tour in England, and was about returning to France.

*Bellini*, the composer of *Norma* and *I Puritani*, died on the 23d September, at *Pietaux*, near Paris. He was only 29 years old.

The Princess *Lieven*, whose skill as a petticoat diplomatist, was long felt in England, was, at the latest dates, in Paris, negotiating, it is said, a marriage between the Duke of Orleans and the eldest daughter of the Emperor of Russia.

**TEXAS.**—From the annexed extracts from New Orleans papers, it would seem that the disturbances which have so long agitated Texas, are likely to terminate in open war with Mexico.

The appeal of Ex-Governor *Houston*, and of several New Orleans newspapers, to citizens of the United States to take part in a war against a friendly nation, will we trust be frowned upon, both by the considerate portion of the public press, and by the federal government.

Our obligations to Americans who choose another country for their residence, cease when they leave their native soil; and it would be a mistaken sympathy, as well as an unjust and impolitic indul-

gence, to take part in any quarrel, in which the American and Spanish American population of Texas may be involved.

SAN FELIPE, Sept. 19, 1835.—Dear sir: War is upon us—there is now no remedy. The answer of Cos, is positive that the individuals demanded must be given up, and that the people must unconditionally submit to whatever the government chooses to do for them. He lays down the principle, that the general government have the right to force us to submit to any reform or amendment, or alterations that Congress may make in the constitution, &c. This is impossible—we had better leave the country at once, for we shall be under the Cos doctrine, without any rights or guarantees of any kind. I therefore think that war is inevitable; we must prepare. What do you think of raising a volunteer corps to protect the consultation, and having it ready without delay? I think it probable Cos will attack the people on Guadalupe in a short time—they expect aid, and ought to have it. I shall send to Nacogdoches immediately.

S. F. AUSTIN.

W. D. C. HALL, Esq.

WAR.—Information was received last night by express, that Gen. Cos landed at Copeno with 400 men; arms and ammunition.

An expedition is now raising in the lower country to take the field at once. They are called upon to rendezvous at League's old place on the Colorado on the 29th of this month.

Every man in Texas is called upon to take up arms in defence of his country and his rights.—Those who can join the expedition on the 29th are requested to do so; as they can join it at James Kerr's, on the La Vaca which will be the principal rendezvous.

A corps of reserve will be formed to march for and sustain the advance. Those who cannot join the advance are requested to unite with the reserve and report themselves to the committee of safety in this place.

It is expected that each man will supply himself with provisions, arms and ammunition to march with.

Arrangements will be made for permanent supplies as soon as possible.

S. F. AUSTIN, Chair. of Com.

September 22, 1835.

The following is from the New Orleans Bee Extra, of October 13th. The intelligence is from the Red River Herald Extra:—

Highly important from Texas. War in Texas—Gen. Cos landed near the mouth of the Brasos with 400 men.

Isaac Parker has just arrived from Texas, bringing the intelligence that Gen. Cos has landed near the mouth of the Brasos with 400 men, with the intention of joining the 700 Federal troops stationed at San Antonio de Bexar, and marching upon the people of Texas. He has issued his proclamation declaring that he will collect the revenue, disarm, the citizens, establish a military government, and confiscate the property of the rebellious. Messrs. Johnson and Baker bore the express from San Felipe to Nacogdoches. Stephen S. Austin has written to several citizens of Nacogdoches, that a resort to arms is inevitable.

They have hoisted a flag with "The Constitution of 1834," inscribed on it, and two hundred freemen gathered around it, determined to stand or fall with it.

We subjoin the following letter from General Houston to the gentleman who brought the intelligence.

SAN AUGUSTINE, TEXAS, }  
Oct. 5th, 1835.

Dear Sir—At your request I hand you a memorandum, that you may be informed of our situation. War in defence of our rights, our oaths, and our constitution is inevitable in Texas!

If volunteers from the United States will join their brethren in this section, they will receive liberal bounties of land. We have millions of acres of our best lands unchosen and unappropriated.

Let each man come with a good rifle and one hundred rounds of ammunition,—and to come soon.

Our war-cry is "Liberty or Death!" Our principles are to support the constitution, and down with the usurper! Your friend,

SAMUEL HOUSTON.

To Isaac Parker, Esq.—Present.

We have no time to make any comments. The

people of the United States will respond to the call of their brethren in Texas!—Red River Herald Extra.

Those gentlemen friendly to the rights of free and republican governments, are requested to meet at the Red River Exchange, this evening; at half past 7 o'clock, to take into consideration the situation of their fellow countrymen in Texas.

Natchitoches, Oct. 7, 1835.

NOTICES OF APPLICATION TO THE NEXT LEGISLATURE.—Act empowering the President, Directors & Company of the Union Bank in the city of New York, to increase their capital stock one million of dollars.

For the charter of a Mutual Fire Insurance Company, to be located in the city of New York, to be called the New York Mutual Fire Insurance Company.

To increase the capital stock of the Bank of New York, in the city of New York, one million of dollars.

To increase the capital of the Oswego Bank, \$50,000.

To increase the capital stock of the Merchants' Bank of New York, five hundred and ten thousand dollars.

To incorporate a company with the necessary capital to construct a Tunnel under the Hudson river, for the purpose of railroad and other communication between the city of Albany and the opposite side of the said river.

[From the Charleston Patriot.]

COMMERCIAL IMPROVEMENT OF CHARLESTON.—As it is highly probable that a public meeting will be called for the purpose of responding to the resolutions passed at Cincinnati, in relation to the contemplated Railroad from the Ohio to the tide waters of this State, it must be all important to give the public mind a proper direction, if possible, on this subject. We have said that by the continuation of our present Railroad beyond its existing line of termination at Augusta, to the Muscle Shoals, all the advantages of the proposed Railroad from Paris in Kentucky, across the country, to Charleston could be obtained by connecting these lines at some point at or in the vicinity of those Shoals. The advantage of giving this direction to any Railroad connecting Charleston with Ohio is obvious on the least inspection of the map. By going round the Cumberland ridge and the Alleghany chain, instead of crossing these Mountains, an immense saving of expense, of time and difficulty of execution would be effected. Instead of the proposed Railroad having to traverse numerous large streams, with a double range of mountains and a territory of sparse population, if carried round those ridges to the South West, it would pass through a comparatively flat, champaign country, with a few large rivers intersecting it, abounding in products of the utmost value and thickly populated. The distance is but very little more than that estimated in a direct line between Charleston and Paris, in Kentucky, where a railroad has been already constructed to the banks of the Ohio. Let us first show this.

Starting from Paris across Western Tennessee in a South West direction and parallel to the Cumberland ridge we reach Nashville, a distance in a straight line of about 200 miles from Paris; from Nashville to the Muscle Shoals is about 100 miles more. The Union railroad from Charleston to Augusta will be soon extended to Athens, in Georgia, as the distance between Augusta and Athens is now under contract. From Athens, in a direct line to some point on the Chatahoochie river, is from 40 to 50 miles. From the Chatahoochie to Decatur in Alabama, the Eastern termination of a railroad round the Muscle Shoals to Tusculum (already completed, being a distance of 60 miles) is 200 miles. The distances may be therefore estimated thus:—

From Athens to a point on the Chatahoochie	45 miles.
From the Chatahoochie to Decatur	200
From Decatur to Nashville	100
From Nashville to Paris, in Kentucky	200
	545 miles.

These distances are not given with minute accuracy, but they are sufficiently so for our purposes.

It will be thus seen that the route proposed by

us, although somewhat more circuitous, is but 70 miles more in extent than that proposed, while it avoids all the difficulties to be met with in crossing extensive ridges of mountainous country and will bring us into the heart of those productive regions in Alabama and Tennessee which it was the original purpose of our railroad to effect. Between Paris, Nashville, and Decatur, the road we suggest would form an obtuse angle, but being carried considerably to the South West of a straight line between Cincinnati and Charleston, it is capable of being united to the Union Railroad with comparatively so little difficulty and expense that we have no hesitation in saying that if the two places should be united this is the proper route.

The only natural difficulties to be overcome in all this distance are Look Out and Raccoon Mountains, in North Alabama, which must be crossed to unite the Chatahoochie with Decatur. The Look Out Mountain is 10 or 12 miles across and is perfectly level for the whole extent of its summit, while the ascent to it going West, is so easy that the traveller is not aware he is ascending an elevation until on the other side, where it is somewhat more steep, pursuing the road now in use, but not at the spot a railroad would traverse. The Raccoon Mountain is 21 miles across and is in all respects similar to Look Out in its gradual ascent and descent with a perfectly level surface also at its summit. It is the impression of persons who have visited the spot, that nature intended this section of country for a railroad communication, in her formation of it, and that there will be more difficulty and expense in constructing the road from Athens to the Chatahoochie than from thence to the Muscle Shoals.

[From the Newburgh Gazette of Saturday.]

The following gentlemen were this day elected Directors of the Hudson and Delaware Railroad Company:—Thomas Powell, John Forsyth, Nathaniel Dubois, John W. Knvels, Benjamin Carpenter, David Crawford, Oliver Davis, John Ledyard, Christopher Reeve, David W. Bate, John P. Dewint, Jas. G. Clinton, Samuel G. Sneden.

This is one of Newburgh's proudest days, and will be the commencement of a new era in its existence. There is no longer a doubt with regard to the construction of the Delaware and Hudson Railroad. The directors have this day been chosen—they are men of determination and perseverance, who will never falter until every section of the road shall be completed. Among the directors are the original proprietors of the work, who have spent their time, their money, and their influence in forwarding it to its present state—and that time, money, and influence is pledged for its completion. We owe much to these men, and will remember long the personal sacrifices they have made—their expanded ideas of public good; and their restless anxiety to promote the interest and advance the character of our village, has devised the measures which have laid the foundations of our future prosperity. When mists and darkness were gathering fast around us, they with a keen and discerning eye saw the whole heavens illumined beyond, and step forth with a strong and nerved arm scattered the mists and darkness, and let in the splendor of a bright and prosperous day. Their deeds will praise them and they will have received an ample reward in witnessing the effects of their efforts—for soon they will see trains of cars rolling down to our landings the products and population of the mighty west—our bay filled with vessels of every burden from every port, and our village rising to a city, shall extend over our heights and along our shores sending a beneficial influence throughout the entire country.

REAL ESTATE.—Two large sales were brought out yesterday—the one city property, by Messrs. Bleckers, and the other 867 Lots of ground at Williamsburgh, by Franklin & Jenkins. This last being unproductive property, was looked to with great interest, as it would probably test the feeling towards what is termed speculative property.—The sale was crowded, and would do justice to the month of January. The property was situated about a mile from the ferry, and sold beyond the most sanguine expectations. Every lot was sold, averaging about two hundred and fifty dollars.—The gross sales were over two hundred and twenty thousand dollars, and paid the owners a net profit of over one hundred and forty thousand dollars on the purchase, which was made about fifteen months since.—[Daily Adv.]

**INTERNAL IMPROVEMENT CONVENTION.—**

In accordance with the views of a large number of the friends of Internal Improvements, a State Convention has been called, to be held at Utica, on the 11th day of November next, to be composed of Delegates from all parts of the State, for the purpose of adopting measures to promote a general system of Internal Improvements, which shall develop the great and important natural advantages possessed by the State of New-York, and with a view of securing to this City the beneficial intercourse of the great West, to which by nature it is so eminently entitled. In accordance, therefore, with this call, the citizens of New-York are respectfully invited to attend a meeting, to be held at the Merchants' Exchange, on Monday, 2d November next, at 12 at noon, for the purpose of selecting Delegates to represent the City and County of New-York in said Convention.

New-York, October 30th, 1835.

**INTERNAL IMPROVEMENT CONVENTION.—**

In accordance with the views of many of the friends of internal improvement, residing in different parts of the State, a Convention is to be held at Utica, on the 11th of November, for the purpose of consultation; with a view of devising measures which shall give renewed impulse to that spirit of improvement which has placed the State of N. York first and foremost amongst States and nations for enterprise and public spirit. This Convention is to be composed of Delegates from different, it is much to be desired from all, parts of the State—and their object is to interchange opinions, and to adopt measures, which shall, if possible, produce a general, a universal determination

throughout the State, to carry out, to its full extent, that grand system which was so fortunately and so successfully commenced with the Erie and Champlain Canals.

To this City, this Convention is of immense importance—to this City, indeed, more than to any other one place, it is of the greatest importance—as what the heart is to the human system, so is this City to the State at large.

Canals and Railroads are to the body politic what arteries and veins are to the body human—and in whatever part of the State a work of the kind is made, the freight to be transported upon it is either destined mainly for, or from, this City. It matters little, in truth, what be the direction of the work, as business, like the needle, will find the point of greatest attraction, and therefore, with ordinary facilities, must find this City.

With a view of increasing these facilities, we publish to-day a call, signed by some of our most respectable citizens, for a meeting to be held on Monday next, at the Merchants' Exchange, for the purpose of appointing Delegates to attend the State Convention at Utica, on the eleventh of November. It is therefore a matter of vital importance that the MERCHANTS of New-York should attend this meeting, and select from their own body able and judicious men—men of enlarged and liberal views, who duly appreciate the natural advantages and facilities which the State of New-York possesses, and who are able and willing to stand forward, and advocate the cause in which all, but the Merchants especially, are so deeply interested.

The meeting will undoubtedly be well attended, and able and judicious men selected as Delegates.

Annexed we publish the proceedings of a Convention held at Cattaraugus county, at which Delegates were appointed to attend the Convention—and we understand that many other counties will also appoint Delegates.

At a meeting of the citizens of the county of Cattaraugus, held at the Court House, in the village of Elliottsville, on the 10th day of October, 1835, for the purpose of nominating Delegates to attend an Internal Improvement Convention, to be held at Utica; the Hon. Benjamin Chamberlain was called to the chair, and Israel Day appointed Secretary.

On motion, Resolved, That Isaac Carpenter, Henry Bryan, Frederick S. Martin, Anson Gibbs, and Phineas Spencer be, and are hereby, appointed delegates to attend the Convention to be held at Utica.

On motion, Resolved, That Benjamin Chamberlain, G. A. S. Crooker, D. Day, Emery Wood, Tilly Gilbert, Ebenezer Jones, Richard Wright, Moses Beecher, David B. Jewet, Nelson Green, A. Bugbee, Ashbel Bushnell, A. G. Bush, Howard Peck, John A. Kennicutt, Eber Holmes, George Graham, Isaac Hull, Silas Nash, Ralph Johnston, and Samuel Harvey be, and are hereby appointed a Committee of Vigilance for the county of Cattaraugus.

On motion,

Resolved, That G. A. S. Crooker, Ass

Hazen, Anson Gibbs, Robt. H. Shankland, and Israel Day, be a Committee to draft a memorial to the Legislature of this State, for the grant of a charter for a Canal from Rochester to Olean: Also a memorial for aid in constructing the New-York and Erie Railroad.

Resolved, That the proceedings of this meeting be signed by the Chairman and Secretary, and published in the several papers in Cattaraugus county.

B. CHAMBERLAIN, Ch'm.  
ISRAEL DAY, Sec'y.

**ENGINEER DEPARTMENT,  
BALTIMORE AND SUSQUEHANNAH RAILROAD  
COMPANY.**

October 19, 1835.  
To Contractors.—Proposals will be received between the 20th and 25th of November next, for the Graduation and Masonry on 20 miles of this Road.

ISAAC TRIMBLE,  
Engineer B. & S. R. R. Co.  
WILLIAM GIBBS McNEILL,  
Consulting Engineer.

**ENGINEER DEPARTMENT,  
WRIGHTSVILLE AND YORK RAILROAD  
COMPANY.**

October 19, 1835.  
To Contractors.—Proposals will be received in York, Penn., between the 20th and 25th of November next, for the Graduation and Masonry, of the whole line of Road.

ISAAC TRIMBLE,  
Engineer W. & Y. R. R. Co.  
WILLIAM GIBBS McNEILL,  
Consulting Engineer.

Oct 31.—34.

**TO TUNNEL MINERS, DRILLERS, &c.**  
Wanted, immediately, 40 Tunnel Miners, (Corahh Miners will be preferred,) 80 Drillers, 50 Laborers, and two experienced Mine Blacksmiths, on the New York and Harlem Railroad, about five miles from the City. Liberal wages will be given, and cash payments made every fortnight. Apply at Mr. FOWLER'S, St. John's Hall, Frankfort street, New-York.

JOHN BUTTER, Contractor.  
The Albany Argus, Philadelphia U. S. Gazette and Pennsylvania, will please copy this, and send their bills to the Railroad Company, 14 Wall street, New-York. 23—4f

**TO TUNNEL CONTRACTORS.**

Proposals will be received by mail, or otherwise, for excavating a Tunnel on the summit of the Sandy and Beaver Canal. The Tunnel is 900 yards long, the material to be removed is a soft sand-stone rock, the highest part of the ridge through which it passes is about 90 feet above the top of the Tunnel. As the deep cuts at the termination are not excavated, most of the material will have to be removed through shafts. Proposals must be accompanied with good recommendations, as to skill and competency.

E. H. GILL,  
Engineer.  
38—6f

New-Liebon, Ohio, Sept. 17. 1835.

**NEW-ORLEANS AND NASHVILLE  
RAILROAD.**

**NOTICE TO CONTRACTORS.**

The New-Orleans and Nashville Railroad Company having decided to place under contract the first fifty miles of the Road, on the 15th day of December next, Proposals will be received at their Office, in the City of New-Orleans, from the 15th of November to the 15th day of December next, for the Graduation and Bridging of the same. The Superintending Engineer, R. S. Smith, will be upon the ground to give every explanation relative to the manner of making Proposals, and such other information as may be required.

Of persons not personally known to the Engineer, there will be required certificates of character and qualifications. This part of the road, extending along the shore of Lake Pontchartrain, is perfectly healthy throughout, and being the commencement of the most extensive work in the world, it cannot fail to be of great importance to Contractors to identify themselves with the work at its commencement, as those who are known to the Company as responsible and efficient will certainly be preferred to strangers during the future progress of the road. The country through which the line passes is generally high pine ridge, and perfectly healthy.

H. J. RANNEY,  
Chief Engineer N. O. & N. Railroad.  
Engineer Office, N. O. & N. Railroad,  
Aug. 25, 1835. 37

## AMERICAN RAILROAD JOURNAL.

NEW-YORK, NOVEMBER 7, 1836.

**SHORT CURVES IN RAILROADS.**—Much difficulty and danger has heretofore attended the use of Locomotive Engines and Cars at any thing like a high velocity, on Railroads with short Curves—and not only danger, but an immense outlay in the construction to avoid Curves, and an enormous expense for repairs, has attended the use of Railroads, thus far, both in this country, and in Europe in consequence of the adoption, in many cases from necessity, of Curves with a short radius; that is to say 500 feet and under.

In consequence of the enormous expense for repair, both of the Road and the machinery, resulting from short Curves and rapid movement, great efforts have been made, at an incredible expense, both in Europe and the United States,—not less, we presume than three to five millions of dollars—to discover some remedy for the evil; and, in this, as in most other cases, where the object sought is of importance, improvements have been made, which in some measure lessens the evil; but still serious difficulties were encountered; accidents continue to occur—and ingenious men to propose remedies.

Amongst the various plans proposed,

which have come to our knowledge, is one invented by Mr. Cleveland, of Baltimore, a model of which we have examined with much care, and tried upon a miniature Railroad,—which bids fair to be of great value, not only on those Roads now in use with short Curves, but more especially on those about to be commenced, as it will enable them in many cases to avoid deep cutting of rocks and ridges, and hills, by going round them, with short Curves, much shorter, indeed, than has, heretofore, been deemed by Engineers, practicable, or possible.

If the principle works as well on a large scale, that is, in cars of the usual size, as it does in miniature, or in the model—and we have good reason to believe that it will, or in fact does, as a car sufficient for 25 passengers has been in use on the Baltimore and Susquehannah Railroad, which has been run for a short distance, on a straight Road, at the rate nearly a mile in a minute, and on the curved part, at the rate of thirty miles an hour—it will be found to be one of the most valuable improvements of the day.

The invention of Mr. Cleveland is exceedingly simple, and its introduction and use on Roads which have not yet obtained their cars, will be attended with very little additional expense in the first outlay—while it will reduce, in a very great degree, the expense of repairs—not only of the machinery, but of the Road also.

It is believed that a car constructed on this plan will not require more power to move it on a curve of 100 feet radius, than an ordinary car will on a curve with four or even five hundred feet radius—and what is of greater importance, the risk, or danger is reduced in an equal ratio, in great velocities.

Should the anticipation of Mr. Cleveland and many others who have witnessed its performance, or examined the model, be realized, it will prove a means of greatly

reducing the expense and danger of Railroads and Railroad travelling.

**LAKE ERIE AND MAD RIVER RAILROAD.**—At a meeting of the Stockholders of this Road, held on the 26th ult., at Sandusky City, the following gentlemen, were unanimously elected Directors: Gen. Joseph Vance, President, H. G. Phillips, Samuel Farrer, C. G. Swain, C. Cavalin, P. Spinning, — Pierson, R. Patterson, L. Curtis, Josiah Hodges, John G. Camp, E. Cook, and S. M. Lockwood. The anticipation of the public in relation to this Road, we are assured, will not be disappointed. The work is progressing rapidly, the greatest proportion of it having been surveyed, and put under contract. The importance of this work to Buffalo, and to New-York, should not be overlooked, and every exertion used by our capitalists and merchants, to insure for it as early a competition as possible.—[Buffalo Adv.]

A meeting of subscribers to the survey of a Railroad from Toronto to Lake Simcoe, was held on the 22d ultimo, W. B. Jarvis, Esq., in the Chair. Mr. Roy, the engineer employed, submitted his report, from which it appeared that there were no obstacles in the way of a Road being constructed, and pointing out what he conceived to be the best route for it to follow. A resolution to the same effect was passed, a subscription entered into to defray the expenses already incurred, and it was ordered that a meeting should be called on the 5th instant, when a Joint Stock Company will probably be formed.—[Montreal Gaz.]

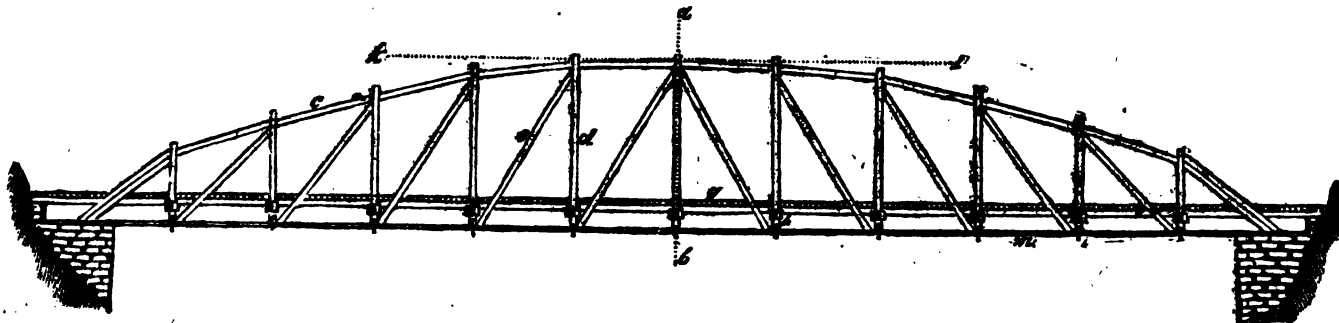

**GREAT SHIPS.**—We learn from the London United Service Journal, that a ship of 110 guns called the Royal Sovereign, is building at Portsmouth, tonnage 3,399, and that the frames of two others, to be called the Victoria and Algiers, of the same size and metal, are preparing at Pembroke. These ships are the commencement of a new class of first rates, of tremendous power, being armed on the lower decks with long 68 pounders.

Letters were received yesterday from Havana, dated on the 12th ult., which state, that there had been a severe gale at Matanzas, in which three brigs had been driven on shore, one of them belonging to Portland, and that a vessel had been despatched to Matanzas to bring to Havana the cargo of one of the brigs.

LIEUT. GEORGE W. LONG'S PLAN OF BRIDGE BUILDING.

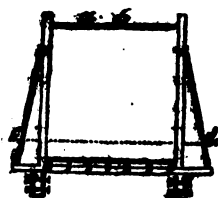

Fig. 1—A Longitudinal Section.

REFERENCES.—a, b, c, top braces; d, posts; e, braces; f, floorway; i, iron sills.

Elliptical Frame Bridge, invented by Lieut. Geo. W. Long, and patented March 10, 1830.

[Fig. 2—A Transverse Section.]

We cheerfully give place to the following communication, in relation to Lieut. Long's plan of bridge building. It will be found we think worthy of attention and should have been published by us at an earlier day, but with many other communications, was delayed by the illness of the editor.

In considering the above plan for a bridge, it may be compared to a beam supported at each end, to do which, it is necessary to consider that in a beam of great length compared with the depth, it becomes a load for itself; and that a greater length of beam can be had by reducing it to the shape of an ellipse, and in the frame it does not differ very essentially from the same. The above frame, then, is calculated on the principle of the beam, with the strings as the first point of fracture, and the top braces as the last, and reduced to that shape to be equally strong throughout. Or it may be explained by comparing the top braces to an arch, the thrust of which is received by the strings, and resisted by them, producing between the different sets, counter stress of the same magnitude to each other, and here this plan has advantages over other framed ones, for instead of the opposing stress of the top timbers, being carried parallel to the strings as in direction of H. L. (see the figure) and requiring a set of ties to brink it back again, these timbers are directed down, and terminates in them. This simplifies the frame, and greatly reduces the expense of it. The actual stress on the strings and top braces, may be calculated by the proportion of the depth of the frame, and half the length of it, as depth of frame, is to half the length, so is the weight placed on it, to the stress on these timbers in weight. This proportion comes from both demonstrations, by the arch and the beam, taking the strength of the beam as the depth instead of square of the depth, as in a solid beam. This stress on the timbers, it will be seen, is in their strongest directions, and

thus with a proportional depth and increased size of these timbers, the strength of the bridge may be carried to an unlimited extent, without undue expense. The drawing shows the mechanism of the frame so plainly, that it is deemed unnecessary to give very particular explanations of it.

In 1831, the proprietor of the patent gave the use of it for a bridge over Tanners Creek, near Lawrenceburg, Indiana, for the first one constructed, the result of which was given him by the person to whom the use of the patent was given, Jonathan Woodbury, in the following words, viz.

"The patent which your liberality furnished me with, has been made use of, and instead of a bridge that would cost \$12 or \$15,000, the Committee which I informed you of for building a bridge, have just completed said bridge, which cost \$3,150;" "its whole length upwards of 400 feet, and its width 22 feet, fifty feet high from the bed of the creek, and seventy-six (76) feet span between the piers, the whole of wood except two stone piers 19 feet high, from the bed of the creek, and framed timbers upon these piers for the arch to rest upon, the other part of the bridge is on bents 20 feet apart, all finished in a workmanlike manner." "That part which we are indebted to you for, is thought to be the best model ever yet found out, both as to strength and cheapness."

"The strength of your patent is thought to be almost beyond calculation, by a comparative view of its cheapness, and the size of its timbers; and should it prove as good as we now anticipate, I have no doubt but it will be a source of income to you; we shall have a fair experiment of all its qualities."

The size of the timbers given for the above bridge, was 8 inches square. The bridge is yet standing (1835) and has, so far answered the public expectations, and others are now building in the same neighborhood.

GEORGE W. LONG.

We are glad to notice that Mr. N. H. BAIRD has commenced taking the levels for the CONBOURG and Price Lake Railroad. Though the country is hilly, yet it appears that, from the number and favorable positions of the ravines, but little obstacle will have to be overcome. It has not yet been determined at what point on Rice Lake the road will terminate.—[Montreal Gazette.]

The stockholders of the CONBOURG Railroad Company were to meet in that town yesterday, for the purpose of choosing Directors.

Pursuant to a call of a public meeting of the citizens of New York, at the Merchant's Exchange this day at 12 o'clock, for the purpose of choosing Delegates to represent the city and county of New York, in the Convention to be held at Utica on the 11th inst., for the purpose of adopting measures to promote a general system of Internal Improvement, his honor the Mayor was called to the Chair, and Saul Alley and Caleb Barstow appointed Secretaries.

After the objects of the meeting had been explained by the Chairman, the following Resolutions were presented by Joseph Blunt, Esq., and were unanimously carried.

Resolved, That the entire success of the western and northern canals, and the prosperous condition of the public finances, justify an extension of the benefits of internal improvement to other parts of the State.

Resolved, That the extraordinary exertions made by other States, to divert the trade of the West to Philadelphia, Baltimore and Boston, warn us not to rest in our career, but to increase the facilities of internal commerce through this State, so as to give full effect to its great natural advantages.

Resolved, That the success of these exertions, in augmenting the trade of Philadelphia and Baltimore, fully proves that a new impulse must be given to the system of internal improvement in this State, in order to keep pace with the growing business of the country.

Resolved, That we approve of the Convention to be held at Utica on the eleventh of November, by the friends of internal improvement, as a means of informing the public mind, and of concentrating the energies of the State in favor of those objects best deserving the public support.

Resolved, That thirty delegates be appointed to represent the City and County of New York in that Convention.

The following individuals were thereupon appointed by the meeting, with power to fill vacancies:

E. T. Throop,	Charles H. Russell,
Philip Hone,	Jas. B. Murray,
D. R. Talmadge,	H. W. Hicks,
Charles H. Hall,	Jona. J. Coddington,
Morgan L. Smith,	J. W. Leavett,
A. B. Meech,	Seth Grosvenor,
Eli Hart,	Geo. S. Robbins,
B. B. Howell,	Jno. R. Peters,
Henry Seymour,	Jos. Biant,
Curtis Bolton,	Francis Fickett,
Nicholas Dean,	Henry Yates,
Wm. C. Wales,	Gideon Lee,
Thos. Barlock,	Jona. Goodhue,
Charles G. Ferris,	Gould Hoyt,
H. H. Elliott,	D. C. Colden,

On motion, it was then Resolved, That the proceedings be signed by the Chairman and Secretaries, and published.

CORNELIUS W. LAWRENCE, Chairman.  
SAUL ALLEY, } Secretaries.  
CALEB BARSTOW, }  
November 2d, 1835.

REAL ESTATE IN CHICAGO.—The American of 17th ult. says:

"A lot fronting 100 feet on Dearborn street, about 65 feet deep, next the corner of Water street, was sold a few days since for \$11,000."

The annexed plan of, and certificates in relation to, Col. Long's Bridge, has been several months in our possession, and ought long since to have been laid before our readers. We publish a part of the certificates accompanying the drawing, which give an idea of the estimation in which the plan is held by practical men.

The undersigned, agent for Col. Long of the U. S. Engineers, offers to all persons interested in Bridges, as is believed, the most important and latest improvement which has yet been made in bridge-building.

The plan of building is such as to bring into profitable use timber of any length, and to build at any length of span from 20 feet to 300 feet between bearings.

Among the important advantages possessed by Col. Long's bridges over others, the following are believed to be peculiar to his:

All the strain on the important timbers is length wise; and this too without any material strain or thrust against the abutments.

Any defects which time shall make, can be repaired with the same facility as the putting in of the original timber.

The work is so well secured as to admit of driving at any speed, with perfect safety, and without injury to the structure.

A great number of bridges built on this plan are already in use in the Eastern, Middle, and Western States; all of which have fully answered the most sanguine expectations of the Architects and Proprietors.

Moses Lona.

The following selections are from the numerous recommendations of Col. Long's plan of bridge-building:

"Baltimore and Susquehanna Railroad Office, January, 1836.—Messrs. Hazard and Casley have constructed for this Company three bridges upon the plan of Col. Long, two of them about 70 feet in length, and the largest 100 feet. I am well acquainted with the different plans that have been adopted for the construction of wooden bridges, particularly Towne's and Burr's, which have been generally used in this part of the country, and I am satisfied Col. Long's plan is superior to any of them, in point of strength, solidity, permanency, and above all, in the facility with which it can be repaired, by replacing any piece of timber without disturbing the structure, so that by constant slight repairs the bridge will be perpetually renewed, at a very slight expense.

"These bridges have been passed more than five months, with a steam engine and tender weighing at least ten tons, with

heavy trains of carriages attached, without causing the slightest perceptible motion of any kind in the bridges, which remain in the exact position they occupied when first erected.

"My opinion in respect to these bridges is sustained by the whole Board of Directors, amongst whom there are several gentlemen who possess much theoretical and practical knowledge on this subject."

(Signed) GEO. WINCHESTER, President.

"The bridges above mentioned were built in conformity to my directions, as also several others on other works under my charge, and I fully concur in the opinions expressed by the President of the Baltimore and Susquehanna Railroad Company, in favor of Col. Long's plan of bridge-building."

(Signed) WM. G. MCNEILL, Captain Top. Engineers.

I hereby certify that under the direction of Col. J. M. Fessenden, the Engineer of the Boston and Worcester Railroad, a bridge has been constructed, on that Railroad over the Charles River, on the principle of Col. Long's patent. The bridge rests entirely on two abutments thirty feet in height, and has a span of a hundred and twenty feet between the abutments. Notwithstanding the distance between the abutments which are the only points of support, it has been found to be remarkably stiff, and free from yielding or oscillation on the passing of the heaviest loads, which often consist of eight or ten loaded cars, in addition to the locomotive engine and tender. It was built by Mr. Thomas Hazard of Baltimore, and has been standing a little more than a year. It is considered by the Directors of the Railroad quite satisfactory both in principle and in workmanship, and remarkably well adapted from its firmness and apparent strength, for a Railway bridge.

(Signed) NATHAN HALE, President of the Boston and Worcester Railroad.

Boston, Dec. 11, 1834.

Moses Lona, Esq., of Warner, N. H., is the agent of the patentee.

We understand, says the Montreal Gazette, that about £14,000 of the stock of the HAMILTON and PORT DOVER Railroad Company, has been already subscribed for, and as by the Act of Incorporation, they are empowered to break ground, whenever £10,000 shall have been paid in, we shall doubtless have soon to report that such a commencement has been made.

"An excellent harbor is now in progress at the extremity of the Road at Port Dover.

As it will be open on an average six weeks earlier than that at BUFFALO, the originators of the Railway anticipate that a considerable number of AMERICANS who are annually moving to OHIO and MICHIGAN, will, rather than incur the expense attendant upon remaining till the navigation opens on their own side, take advantage of the communication between HAMILTON and Lake Erie.

Another source of profit to the Railway, will be the transport of produce from the extensive and rich country lying to the west and south-west of HAMILTON.

Now the election is over, says the Rutland, Vt. Herald, we must attend to the "weightier matters."

OUR RAILROAD must be promptly attended to. By notice in another part of this paper it will be seen, that on Tuesday next (the 8th) the Books for subscriptions to the stock of the Rutland and Whitehall Railroad, will be opened in this town, and on the 15th at Whitehall.

We are often inquired of whether we think the stock of this Road will be taken up, and the project go into operation. We here take occasion to say, once for all, that we have scarcely a doubt but what this Road will be made, sooner or later.

The Board of Directors of the Grand River Navigation Company, have given publication to a resolution lately adopted by them—that the first Steamboat, of not less than fifteen horse power, that shall ply on the Grand River, from DUNNVILLE to the head of the navigation, when opened, shall be allowed to pass toll free through the locks, as long as she shall ply thereon—and that the two first covered barges, to cost not less than \$250 each, and built to ply regularly and constantly on this navigation, shall, in like manner, pass free of toll.

IMPORTANT DECISION.—The well known *Attackment Cases*, of John Randel, against the Garnishees of the Delaware and Chesapeake Canal Company, were decided in the Court of Errors and Appeals, at Dover, on Friday last. The Chancellor delivered the opinion of a majority of the judges, and the Judgment of the Court in favor of the Plaintiff. This decision establishes the right of Mr. Randel to attach the tolls in the hands of all captains of vessels entering the Canal.—[New Castle (Del.) Gazette.]

CONVICTION FOR PERJURY.—At the late court for Portage county, Ohio, Col. W. B. Washington was convicted of perjury, and sentenced to seven years imprisonment. He was a man of standing and property, whose avarice prompted him to commit the perjury.

With such a name, to commit such an act, is to sin against all influences. We hope the Legislature of the State possesses the power to change the man's name—since that name could not save him from perjury.—[U. S. Gaz.]

*Letter from John B. Jervis, Holmes Hutchinson, and Frederick C. Mills, relative to a Ship Canal from Utica to Oswego.*

TO THE CANAL BOARD.

Gentlemen,—The undersigned have examined a memorial to the Honorable the Legislature, from the citizens of Utica, praying for the construction of a Steamboat Canal, from the village of Oswego to the city of Utica, and ultimately to be extended to the Hudson River; and also a report on said project by E. F. Johnson, Esq., and submit their views of the same in the following report:

The memorial appears to be based on the position, that trade on the Erie Canal has nearly reached the maximum capacity of the Canal; that the trade is rapidly accumulating, and consequently, that enlarged means of communication will soon be indispensable to its accommodation, and proposes the construction of a Steamboat Canal from Oswego to Utica, and ultimately to the Hudson River, as the best mode of accomplishing this object.

In the proceedings of the meeting at Utica, the projected work is called a Ship Canal; but in the memorial from the same place, it is called a Steamboat Canal. In the proceedings of the meeting, and in the memorial, it is regarded as designed to afford navigation to vessels navigating Lakes Ontario, Erie, &c.

The dimensions of the proposed Canal, as given by Mr. Johnson in his report to which the memorialists refer, are 8 feet depth, 58 feet width of bottom, and 90 feet surface of water; and the locks to be 130 feet length of chamber and 30 feet in width.

From the width of the locks we conclude the Canal cannot be designed to accommodate the steamboats of Lakes Ontario and Erie: we are therefore left to infer, that the steamboats are to be adapted to the Canal, and used to tow the vessels that may be used in the navigation of the Lakes.

The memorial represents the future trade of Lake Erie, as the leading and prominent object to be secured by the proposed Canal, and which cannot be retained for any great length of time by the Erie Canal, on account of its limited facilities for transportation, as compared with the prospective magnitude of this trade. Mr. Johnson proposes to construct the Ship Canal, and anticipates the enlargement of the Erie Canal west of the intersection of the proposed "Steamboat Canal," to 6½ feet depth and 60 or 70 feet surface of water.

To the undersigned it appears that if the Erie Canal needs relief, it will first require it for its Eastern section, which is obviously under the greatest burthen.

To open a steamboat navigation from Oswego to Utica, would leave 110 miles of the Erie Canal, which is most crowded, under at least the same embarrassment, that would otherwise burthen and impede its navigation. But the question which part should be first opened, may not be deemed essential to the present inquiry; it is sufficient for us, that the memorial contemplates a Canal from Oswego to the Hudson; and we shall of course take that view of the subject.

The memorial and report assume that the proposed Canal will afford the means of a cheaper and more expeditious transportation than can be effected by any other route. A small saving of time and expense in a trade of the extent we may anticipate, is doubtless an object of great importance. That the trade from Lake Erie, which will seek an Atlantic market through the central part of this State, will be large, and that the Erie Canal, in its present condition, will be inadequate for its accommodation, at no very distant period, we do not doubt. This position is fully taken by the Canal Commissioners in their recent report on the improvement of the Erie Canal, and also by the Canal Committee, in their recent report made to the Assembly. In our opinion, this view is so clear as not to admit of any reasonable doubt, and of course any elaborate argument to settle its magnitude is deemed to be uncalled for, from us, if not superfluous in itself; we therefore proceed on the ground that this position is fully admitted.

It appears necessary to a correct understanding of the subject, that we ascertain the definite character of the projected Canal. As before observed, it is called a "Steamboat Canal;" and we have been led to suppose it was designed for steamboats especially adapted to its navigation, and which would be too small for the large Lakes, but would tow on the Canal, the freight boats that would be towed by larger steamboats on the Lake. It also seems contemplated by the report referred to, that sail vessels will be used to some extent on the proposed Canal, as the tonnage of such as are deemed suitable for the size of the Canal is given, with that of freight barges, and the time of making the passage on Lake Ontario is stated to be the average between sail and steam vessels. Mr. Johnson, after stating that experiments in navigating small Canals by steam had hitherto failed, seems to think that it can be successful on large Canals, and in reference to the one under consideration, gives his opinion as follows, page 56: "That it can be so applied, on the portion of the proposed

Canal from Utica to Oswego, I do not entertain a doubt." In the next paragraph he says, "Where there is much lockage to be overcome, this method, from the delay attending the passage of the locks by a train of boats, cannot so conveniently be adopted."

In the following paragraph, he says: the principal elevation is overcome between the Lake and Oswego Falls, and between Fish Creek and the Rome Summit, together about 22 miles; and continues, "For vessels passing in train on these portions, animal power may, perhaps, be used with economy."

It would therefore seem the economy of steam, as compared with animal power, is not in all cases conclusive, though the phraseology is so framed as to leave the preference of the engineer involved in some degree of ambiguity. We have rather concluded he intends animal power on two sections between Lake Ontario and Utica; so it appears the application of steam on this portion may be understood as follows, to wit: From Lake Ontario to Oswego Falls animal power is proposed; thence to Fish Creek steam power, thence to Rome Summit animal power, thence to Utica steam power, and from Utica to Albany no opinion is given whether steam or animal power is intended. If the same qualifications, as made above, may be inferred from the question of lockage, we must conclude that the section of the "Steamboat Canal" extending from Utica to the Hudson will be navigated by animal power. We have been thus particular in order to obtain, if practicable, some standard character for the projected Canal. The appellation of "Steamboat Canal," gives the impression that it is designed to be navigated by steam power; but in detailing the project, the engineer seems to modify this character so materially, that we are left to suppose it was at least doubtful in the opinion of Mr. Johnson, whether animal or steam power would be the most economical on a large portion of it. It is, however, urged in general terms, both in the memorial and report, that steam power may be used on the Lakes and Canal with great advantage, and that by this means transportation will be effected with greater celerity and economy than by any other route. We find some embarrassment in meeting the subject for the want of a specific exposition of the plan or method by which the object of the project is to be accomplished, and shall be compelled to follow it more at length than would otherwise be necessary. The great importance of providing for the trade of Lake Erie will, we trust, be a sufficient apology for what may be a somewhat lengthy examination.

It has been shown the proposed Canal was not adapted to the steamboats that navigate the larger Lakes. Consequently to use Lake steamboats in any other way than by towing barges, would make transshipment necessary, and thereby sacrifice one of the prominent objects claimed for the improvement. Mr. Johnson proposes the towing plan on Lake Ontario, and of course to avoid transshipment the same plan must be adopted on Lake Erie. This method of navigating has been very successfully practised on the Hudson River: on the larger Lakes, though a great number of steamboats have been in use for several years, the plan has not been adopted, for the reason, that the steamboats cannot manage barges in a storm. We have been informed of a proposition made to the proprietors of a steamboat, to take some Canal boats from Buffalo to Cleveland; and it was accepted *only* on the condition that in the event of a storm, they should be at liberty to cut them loose at the risk of the owners.

An intelligent gentleman of several years experience in navigating steamboats, and the last two seasons on Lake Ontario, informs us that he considered it impracticable, as a regular business for steamboats on the Lakes, to tow vessels with safety, unless the vessels were fitted with masts and rigging, and manned sufficient to be conducted by sails in a storm; the storms often rise very suddenly on those Lakes, and with such violence as would compel a steamboat to cut loose vessels in tow in order to sustain herself.

Steam power, as adapted to navigation has been known for many years, and we are not aware that any material improvement has recently affected its economy. It has been in the hands of an enterprising people, who would not be slow to discover its adaptation to any useful modification in the economy of navigation: and when we consider the broad hint given on the Hudson, we are led to the conclusion, there is some difficulty in the economical application of the towing system on the great Lakes. No fact or reasoning is given in the memorial or report, to show that the difficulties had in any respect been obviated, and we are led to suppose there are none. We are therefore brought to the conclusion, that transportation on the Lakes must be done by sail vessels, or on board the steamboats. We suppose schooners might be towed by steamboats, and thereby render the passage shorter and more certain; but whether the saving of time would pay the extra expense, we are not informed.

In regard to the use of steam power on the proposed Steamboat Canal, we have observed a want of perspicuity in regard to what was designed. Mr. Johnson (page 54) gives the speed on the proposed Canal at 5½ miles per hour, and after a few remarks,

alludes to the use of steam on the Canal as a means of effecting greater expedition than can be obtained on the Erie Canal route. In the next page, after giving a list of prices of transportation, he remarks on the great difference in favor of wind and steam upon the larger waters, as compared with a Canal: and immediately alludes to the contrast between the cost on the Hudson River and the Erie Canal; in the next page he says, an important saving in expense is likewise anticipated by the use of steam as an impelling power. The memorial takes the ground that steam is best adapted to the Canal, and draws comparisons between its use on the Hudson River and Lake Erie, and the navigation of the Erie Canal. The manner in which the question of the applicability of steam power to the navigation of the proposed Canal is treated, both in the memorial and report, is calculated to give the impression that it is an important consideration, and we therefore propose to examine it.

In making a comparison between the cost of transportation on Canals, Lakes and Rivers, to determine what power is the best economy, it is clearly proper the item of tolls should be kept out of view. For although the entire cost of transportation will be affected by any change of tolls to which the mode of conveyance may be subject, still, they form no part of the expense of propelling power, and therefore it is evident they are to be excluded in determining between the economy of the kinds of power used. We have procured the following statement of charges for transportation, which are exclusive of toll on the Canal:

For flour per ton per mile,	
Hudson River by steam towboats, (145 miles,) . . . . .	8 mills.
Erie Canal, (363 miles,) . . . . .	8.9 "
Erie Canal, (369 miles to Rochester,) . . . . .	9.2 "

The above prices have been recently established. We have no prices for steam on Lake Erie or Lake Ontario since those of 1834.

Merchandise per ton per mile,	
Hudson River, steam towboat, (recent tariff,) . . . . .	15.1 mills.
Erie Canal, (recent tariff,) . . . . .	21.5 "
Buffalo to Detroit, (350 miles, for 1834,) by steamboat, . . . . .	37.4 "
Oswego to Lewiston, (146 miles,) by schooners and steamboats, as per 1834, . . . . .	29.0 "

The above includes port charges, and as these are the same for long and short distances, they will modify the ratio above indicated in proportion to the distances; and the Canal will also be affected by its lockage.

The distance on Lake Erie and the Erie Canal are nearly equal, and will afford a fair comparison, except the inconvenience of locks. The Hudson and Ontario navigation is less than half the Canal in length; but it is considered the locks on the Canal are nearly if not quite equivalent to its advantage in length; at least, it cannot be materially different from this; and we may take the prices as a fair indication of the relative economy.

On the Erie Canal, flour is found to be very near the average of all the freight: In this article it appears the cost of animal power on the Canal is 12 per cent. greater than steam power on the Hudson, and for merchandize, 42 per cent. greater. The agricultural products, including ashes, which range much the same as flour in price of freight, are in quantity, as compared with merchandize, about 2½ to 1, making the average cost of transportation on those articles 21 per cent., or say one-fifth greater on the Canal than on the Hudson River. The prices on the Lake steamboats that carry the goods on board, are above the Canal prices; and we do not think it necessary to make any further statements in relation to them at this time. Perhaps there are no waters better adapted to the steam towboat method of navigation, than the Hudson River; and yet the price of navigation by animal power on the Erie Canal is but 21 per cent., or one-fifth greater, instead of three to one, as stated in the memorial and report before referred to.

The Erie Canal is small, and the traction of boats that navigate it, is from 30 to 45, and most usually about 40 per cent. greater than would occur on a Canal of the most favorable size for the boat used: If it was adapted to the most favorable navigation of boats of 100 to 150 tons, only a small proportional increase would be required in the expense of men to navigate them; and it is believed the transportation by animal power on the projected "Steamboat Canal," could be effected at half the present cost on the Erie Canal, which would reduce it to about two-thirds of steam power on the Hudson. It should be observed the speed on the Hudson is from 2 to 3 times greater than on the Canal. If we add the toll on the Canal, the cost of Canal navigation will be increased; but as before observed, this should not be included in determining the relative cost of the power used, which is our present object. If steam power was used at a lower velocity on the Hudson, it is believed it would be more economical; this, however, would make it less profitable in regard to passengers, and perhaps freight would not be much re-

duced, if the passenger business was sacrificed for the lower speed; another consideration has an influence in this case; steamboats of small power would not be able to manage their barges in the broad parts of the river in heavy blows. But on the presumption they had a uniform smooth surface to navigate, they could doubtless be made to effect transportation, that alone being considered, at a low velocity, for less cost than at present. The amount of this reduction will in some measure depend on circumstances; and especially in its application on the proposed "Steamboat Canal," where the dimensions are so much below the broad sheet of the Hudson, that we can hardly indulge the hope of reducing it materially below what it now is, on that river.

It has heretofore been considered that the agitation of the water, produced by the paddles of steamboats in Canals, was too severe in its action on the banks; and hence we find that even in England, where steam power is much cheaper in proportion to animal power, than in this country, they adopt animal power generally, not only "on small," but also on LARGE Canals: we are not aware of any instance of the use of steam power on Canals, unless it be to pass comparatively short sections that intervene in the navigation of larger waters.

The detention and consequent increased expense of steam power in passing locks when used for towing trains of boats on Canals, must ever constitute a serious objection to its use.

In view of the whole subject, we are led to the conclusion, that experience has thus far shown animal power to be not only best adapted to propelling boats on Canals, but when applied to both large and small Canals is more economical than steam power.

In speaking of the application of steam power to Canal navigation, Mr. Johnson calls it a "great and growing power of the arts." We should not allude to this expression, if we did not believe it was calculated to give an impression of the prospective importance of providing for the use of steam power, that is not warranted from experience. That steam is a great power, no one will question: Whether it has reached the full development of its efficiency, we shall not attempt to determine. Since the days of Watt and Evans, the ingenuity of scientific and practical mechanicians have been largely put in requisition, to improve this truly noble engine of art; many patents have been obtained; the working gear has been made more convenient and efficient; the condensing engines have been made to condense more perfectly; the application of its power to the work performed has been made more direct, simple and efficient; the workmanship of its machinery has been improved, and some increase has been given to the economy of its boilers, in generating steam. But the great principles of the engine remain materially the same as left by those distinguished men. The application of this power is now made with great simplicity; and we see no reason to believe there is well founded probability of any such improvement in its application to navigation, as will warrant a reliance in laying the foundation of a project that will cost millions, and be intimately connected with a great public improvement.

As a general principle, steam, when employed for stationary purposes, is much more economical than animal power, and is peculiarly so where fuel is cheap. There are reasons, however, that materially affect its comparative economy when employed in locomotion; but we do not suppose we are called on to make an exposition on this point. The facts given are the result of much experience, and these we deem to be the only proper basis in laying the foundation of extensive public works. It is easy to conjecture that the time may arrive when steam power may be used with economy on the long levels of large Canals; but it is believed a careful examination will show the probability to be too remote to justify any considerable expenditure at this time.

From the preceding examination we are irresistibly led to the conclusion that the use of steam power, on the proposed improvement, from Lake Ontario to the Hudson, is inexpedient, except where it may be important to avoid the expense of a towing path, which we believe will only occur on the Oneida Lake, a distance of 21 miles.

It should be kept in view that we have been considering the subject in regard to the comparative economy of steam and animal power on Canals; and that this does not determine the entire cost of transportation. Canals are the works of art, and involve expenses of construction and maintenance, which must be reimbursed in the shape of tolls charged on the freight, while natural waters are free from such expenses. And, although the expense of navigation may be greater than on a Canal, exclusive of tolls, still the natural navigation pays no tolls, and in regard to the total cost, may therefore be, and often is, the cheapest.

The question in regard to the application of steam power on the proposed "Steamboat Canal," being, as we believe, conclusively disposed of, we proceed to consider another peculiar feature, which the memorial considers of great importance, to wit: The means of affording a passage for Lake vessels, to proceed directly to the Atlantic markets. In order to avoid transhipment

we have shown this must be done by vessels adapted to the use of sails on the Lakes.

The memorial contemplates effecting the transportation between Lakes Erie and Ontario through the Welland Canal. Mr. Johnson, in his report, speaks of the distance from Buffalo to Lewiston in his calculation of time, and in his locks provides for a larger vessel than can pass the locks on the Welland Canal. We presume that a link in so important a chain of navigation would not be left in the control of neighbors, who are proverbial for taking care of themselves; we therefore proceed on the presumption, that a Canal for Lake vessels will probably be required from somewhere near Buffalo or Black Rock to Lewiston, in order to perfect the scheme.

The first inquiry will be to determine the relative cost of Canal transportation by vessels adapted to the navigation of the larger Lakes, and by boats adapted exclusively for a Canal of the same dimensions as the proposed "Steamboat Canal."

In his report, Mr. Johnson proposes to accommodate the navigation to schooners of 160 tons, register measure, which would be equal to at least 200 tons, actual tonnage.

This is believed to be considerably larger than is generally used in the navigation of Lake Ontario, though perhaps not larger than vessels on Lake Erie; but he has chosen this size, and as it will not materially affect the comparative view, we follow out the question on the position he has assumed. He adopts 30 feet as the width of his lock chamber, partly to accommodate the Erie Canal boats in pairs, and further says, it is "but little, if any, greater than would be required for vessels of suitable proportions for Lake service, drawing 7 feet water."

The length of beam is not given, but from the size of the lock we infer that it must be from 26 to 28 feet, and that the vessel will have a transverse section, at her midships, below low water line, of at least 150 feet, and will probably be something more, but the data are not full, and we wish to give the schooner all she is entitled to in the comparison, and therefore adopt this as her transverse area.

A Canal boat 104 feet long, 16 feet wide, drawing 7 feet water, will carry 200 tons burthen, and require a lock 115 feet in length and 17 feet width of chamber, sectional area of boat below load water line, 108 feet. The weight of the schooner, including her furniture, in proportion to the load she will carry, may be taken as 3 to 4, making the gross load of vessel and cargo 350 tons.

In regard to this ratio we would observe, that we find in Rees' Cyclopaedia, art. ship building, an estimate of the weight of a 74 gun ship, and the burthen as follows, to wit: The vessel, including hull, masts, rigging, anchors, cables, and all that is properly the ships furniture, for the sailing and government of the vessel, to be 1,579 tons; and her armament, ballast and complete loading, 1,250 tons. We also find an estimate under the same authority for an East India ship of the most approved model, by which it appears the weight of ship and furniture was 811 tons, and her registered tonnage 990 tons, and the actual weight of a full cargo, 1,217 tons. A practical ship builder, in Albany, of much experience, (Mr. Annesley,) informs us that the usual estimate for sail vessels for merchant service, is as 1 to 1; that is, the vessel will weigh equal her registered tonnage. We therefore suppose the ratio of 3 to 4 will be a fair medium.

Canal boats constructed with reference to freight merely, will generally weigh, in the ratio of their cargo, as 4 to 9.

If large boats will hold the same ratio of those used on the Canal, and we see no reason why they should not, then the boat of 200 tons will have a gross load of 289 tons. The gross load of the schooner will therefore be (61 tons,) 21 per cent, or 1-5 greater than the canal boat.

The power required for traction, will be in proportion to their transverse section, provided they hold equal or similar ratios to the transverse section of the Canal, or if the Canal is equal in both cases to an unlimited expanse of water. The ratio of schooner to Canal, is as 1 to 3.94: the ratio of canal boat to Canal, is as 1 to 5.48. The relative power of traction, (deduced from the formula of Du Buat,) for equal sections, will be as 100 to 125. The ratio of the sections of boat and schooner are, 100 to 138; and we have, therefore, the ratio required for the boat and schooner, as 100 to 167.5, or the schooner will require, (67 per cent,) 2-3 more power to tow her than is required for the boat.

We have been informed that schooners of 100 tons burthen, cost on Lake Ontario \$4,000, and that canal boats constructed exclusively for freight of equal burthen, will cost \$1,400; pursuing the same ratio, the schooner of 200 tons would cost \$8,000, and the canal boat \$2,800, for the same tonnage. The ratio of cost is as 100 to 285, or the schooner will cost nearly three times as much as the canal boat. The schooner being over 50 per cent. wider than the boat, and having a section much larger, (near 40 pr. ct.) in its ratio to the Canal, will be managed with more difficulty, be more liable to come in contact with other vessels, and the sides of the Canal, and will consequently be exposed to greater wear.

The gates for the schooner locks will be nearly double the size of those for boats; will work more heavily, be more liable to injury,

and consequently be more expensive to manage and to maintain.

In view of all the circumstances that affect the cost of transportation as above presented, we have come to the conclusion, that the cost of transportation on the proposed Canal, by schooners, will be 75 per cent. more than by boats made exclusively for Canal navigation. This is exclusive of the expense of loading and unloading.

The cost of transportation, by canal boats on a canal of the dimensions of the proposed "Steamboat Canal," it is believed, will not exceed 5 mills per ton per mile; but we will assume it at 6 mills: and by the ratio above stated, the cost per schooner, will be 10½ mills. In view of the great amount of trade that may be expected, and the encouragement we may suppose the State will be disposed to afford, for more effectually securing the same, it is presumed the tolls will not be more than an average of 5 mills per ton per mile, which would be a trifle over half the present tolls on the Erie Canal. Upon this basis, the cost of transportation by schooners, including toll, would be 15½ mills per ton per mile. The canal boats not being adapted to lake navigation, must be charged with the expense of transshipment at Oswego; from this place they may proceed to the Hudson, and then be taken in tow by a steamboat, for which they will be well adapted, and proceed to any market on that river. The cost of transshipment from one vessel to another, when a large business is done, as at Albany, is effected without any material warehouse charges; the port expenses are therefore, for transshipment from one vessel to another. Men that have been extensively engaged in this business at Albany, inform us, that 15 cents per ton will pay all expenses of transshipment, including cooerage and other repairs to casks and boxes, that is made necessary in transshipment. We propose to put this at 25 cents per ton, which appears to be a liberal allowance for all contingencies. We are aware the port charges would be about double this sum if the freight generally required warehouse expenses; but we suppose a large business at Oswego, would produce the same result as it has at Albany.

The charges for transportation from Oswego to the Hudson by schooner, will be per ton per mile—

202 miles at 15½ mills,	\$3.15
By canal boat—	
202 miles at 11 mills,	\$2.22
Transshipment at Oswego,	25
	2.47

Difference in favor of boat, 66

We have supposed toll to be charged through Oneida Lake in both cases, and the same toll is charged on both vessels; though the extra expense in managing the pivot bridges, would require a higher toll on schooners than on boats.

If the Canal was comparatively short, the expense of transshipment would throw the superior economy in favor of schooner navigation. As for instance, from Buffalo to Lewiston there could be no doubt of the superiority of a navigation by schooners.

The navigation of the Canal by schooners requires the passage from one side of the Canal to the other by pivot or draw bridges, for public roads, and for the accommodation of farms; Mr. Johnson proposes "scows or floats, securely moored in basins formed out of the main range of the Canal." He says, between Utica and Rome, there is "upwards of 20 farm bridges." Between Utica and the Little Falls there is a fraction over 3 farm bridges per mile, for 22 miles. It would be easy to form basins for these floats on the berm side of the Canal; but basins on the towing-path side will require to be bridged. The inconvenience to the land owner, in using this method, where the passage of vessels will be very frequent, and the liability of the floats to get loose and be driven about and destroyed by the vessels navigating the Canal, the expense of maintaining so great a number of towing-path bridges, under the wear to which a large business will expose them, together with the inconvenience to which the navigation will be at times liable from this plan, render it in our opinion very objectionable. To pursue any other course would involve heavy expenses for damages, particularly in the valley of the Mohawk, where the Canal would generally divide the upland from the intervalle, leaving the latter between the Canal and the River. The intervalle lands rarely afford good situations for buildings and Roads, and would not make desirable farms without some portion of upland. The Canal would not therefore be readily adopted as a boundary of property.

The accommodation for public Roads must be by pivot or draw bridges. When a small number of vessels pass daily, a draw may be used without any great inconvenience to common Roads; but if we look forward to the trade contemplated to flow on this great thoroughfare, the great inconvenience to the common Roads and the navigation from crossing by this method must be apparent. And in large towns and villages the communication between the two sides of the Canal would be peculiarly perplexing and disad-

vantageous: though there are difficulties, we by no means consider this method of crossing the Canal impracticable; but have thought it incumbent on us, to point out the inconveniences that are inseparable from this plan.

The lock that is required for the schooner, in order to provide for her peculiar form and rigging, is necessarily longer and wider than required for a canal boat of equal tonnage; and we find the lockage water for the same tonnage to be (90 per cent.) nearly, and we may say double for the schooner that is required for the canal boat.

The calculation for traction has been made with reference to the vessels moving at the same velocity. If, however, it should be desired to increase the speed at some sacrifice in the price of freight, it could be done best with the canal boat, as its ratio of section to the Canal is more favorable than that of the schooner. Mr. Johnson, in making a comparison between this route and the Erie Canal, puts the velocity on the Erie Canal at 2½ miles per hour, and on the proposed "Steamboat Canal" at 5½ miles per hour. The sectional area of the Erie canal boats, on the average, have a ratio to the transverse section of the Erie Canal full as favorable as the schooner to the proposed Canal. We suppose he contemplated steam power to enable him to obtain this superiority in speed, which, by the usually received principle of computation, would require nearly 5 times as much power as a speed of 2½ miles per hour. The sectional area of the schooner to the Canal is as 1 to 3.94, and for a vessel of this size, having this ratio to its Canal, would be moved at this velocity only by a greatly increased expense of power, and would produce such a wave as to throw the water of the Canal over banks of the usual height, and in a short time destroy any ordinary protection that could be given them. We do not therefore see any ground to support this position; on the contrary, the inconvenience of managing large lock gates will produce more delay in passing them than would happen with small ones; and the only advantage in point of time is in the transshipment, which we suppose may be equal to one day over the gain by the boat in passing locks.

We are brought to the following conclusions, to wit: That schooners would gain, by saving transshipment, one day in navigation between Oswego and Albany.

That the cost of transportation would be 66 cents per ton greater than by boats.

That schooners would require double the quantity of lockage water.

That in consequence of the necessity of draw bridges a schooner navigation would greatly discommode the ordinary inter-communication of the country through which it passed.

That the use of steam power is inexpedient.

In regard to the construction, we have no doubt of the practicability, but we are unable to say any thing definite in relation to cost. To do this properly, the plans of the work, not merely in general, but in detail, should be settled, and a careful location and measurement of the contents of the several parts of the work made. Experience has proved that no great reliance can be placed on cursory surveys; the general practicability of a project may be ascertained, but the particulars are highly essential to a knowledge of the cost. We believe a work requiring large expenditures, and when the expense would probably have a material influence on the question, whether it should be undertaken, should have a full examination before any professional opinion should be given in relation to its cost.

The projected Steamboat Canal occupies 127 miles of the Erie Canal route extending from the Hudson to 2 miles west of Rome; and as before observed, Mr. Johnson anticipates its enlargement from the point of divergence near Rome, westward, to 8½ feet depth of water, and 60 or 70 feet width at the surface. Now, we propose for comparison, that this enlargement shall be extended to the dimensions of the proposed "Steamboat Canal," to wit: 8 feet depth of water, and 90 feet width at surface. This would give a large Canal from the Hudson to Lake Erie. To compare the cost of transportation from Albany to Buffalo on this route, with that by Ontario, we must inquire into the cost of transportation on Lake Ontario. This has been stated at 29 mills per ton per mile for merchandize, as per rates of 1834, given by Mr. Johnson. A forwarding merchant connected with the Oswego line, (Mr. Griffith, of Troy,) informs us, the price of freight from Oswego to Lewiston, is 20 cents per hundred. Capt. Vandewater, of the Steamboat United States, on Lake Ontario, says he has carried freight at 15 cents per hundred, each way, for the last two years. That the price by schooner is about the same. He gives it as his opinion, that if they had plenty of freight, that steamboats would carry for 15 cents up and 12½ cents down, and schooners for 12½ cents up and 10 cents down. To put the average at 10 cents, and allow 2 cents for port charges, would bring the cost to 8 cents per hundred for the freight over Lake Ontario, which is probably as low as we can anticipate for an average rate by schooners. This will give per mile, from Lewiston to Oswego, (146 miles,) 10.9 mills per ton per mile. The cost from Buffalo to Albany, will then be by schooners—

Buffalo to Lewiston, 20 miles, Canal at 15½ mills,	\$0 46½
Lewiston to Oswego, 146 miles, Lake, at 10.9,	1 59
Oswego to Albany, 202 miles, Canal, at 15½,	3 13
	<hr/> \$4 18½

By Canal boat—	
Buffalo to Albany, 363 miles, Canal, at 11 mills,	\$6 80
Transshipment at Buffalo,	25
	<hr/> \$6 4 24½

Difference in favor of Erie Canal, 94  
If the charge for transportation by the boat is raised to 8 mills, and the tolls also to 8 mills per ton per mile, then the comparison will be as follows, to wit:

Ontario route,	\$6 80
Erie Canal route,	6 05

Difference in favor of Erie Canal, 94  
The time required, allowing 3 days as the average passage on Lake Ontario, which we are informed, is rather below the average for schooners, and 6 hours extra time in passing 30 locks more on the Ontario route than the Erie Canal, will be for the—

Ontario route—	
232 miles of Canal navigation, at 2½ miles per hour,	93.6 hours.
Extra time for 30 locks,	6 "
Lake navigation, 3 days,	72 "
	<hr/> 170.6 "

Erie Canal route—	
363 miles of Canal, at 2½ miles per hour,	145.2 "

Difference in favor of Erie Canal route, 125.6 "  
If steam power was used on Lake Ontario, from 40 to 50 hours would be saved in time, making this route in time, about one day the shortest. This would of course be at an increased expense.

Whether the communication be made from the Hudson to Lake Ontario, or from the Hudson to Lake Erie, we are of the opinion, a Canal, designed for boats exclusively adapted to its navigation, and which may be towed by steamboats on the Hudson, will best accommodate the prominent interest involved in the great trade, for which provision is to be made.

In order to draw the comparison, we have taken a boat of 300 tons burthen; but we would observe, that we consider this to be larger than can be navigated, with the best economy, on the proposed Canal. Its sectional area, although much more favorable in its ratio to the transverse section of the proposed "Steamboat Canal," than the schooner we have considered, is still too large for the most economical traction. A Canal boat, designed to carry ordinarily 120 tons, and which could, when a pressure of freight demanded, carry 150 tons, we believe may be conducted with the best economy in transportation. A Canal having 8 feet depth of water, and 90 feet width at surface, with locks 10 by 115 feet chamber, could be navigated with the best economy by a boat carrying from 120 to 150 tons burthen. We are fully persuaded a boat of this capacity could be navigated on a Canal, suited to afford it the most economical traction, for the lowest price assumed in the computations above made. In regard to the size of Canal, we are aware, its ultimate capacity will, in a great measure, depend on the capacity of the boats that may navigate it. This, however, has its limit. The boat may be so large as to render its management inconvenient, and subject its navigation, in passing locks, to so much delay, as to diminish rather than increase the capacity of the Canal. The point which will afford the greatest capacity, can only be determined by experience. And in view of the prospective importance of the trade to be accommodated, the dimensions of the Canal should be settled, in our opinion, on a scale that will reach its utmost efficiency. In regard to proportions, we believe, that 80 feet width of surface, is as great a width as should be given for 8 feet depth; and if a larger Canal is deemed necessary or expedient, a corresponding increase in depth and width should be made. A deep Canal requires less water for evaporation than a shallow Canal of the same width; and if in contracting the width, the section is retained by deepening, we shall enhance this economy. The lockage water is also less in proportion to the tonnage, for a boat of greater than for one of less draught of water. Proper limits, however, are to be observed; the width should be such as to allow the boats easy space in passing each other; and it is highly important this should be liberal where the meeting is as frequent as may be anticipated. We are of opinion, that 10 feet surface is ample for each foot in depth.

Respectfully submitted.

JOHN B. JARVIS,  
HOLMES HUTCHINSON,  
Ezekiel C. Mills,  
Civil Engineers.

Albany, 23d March, 1835.

The following account of the business of the Welland Canal is, we believe, from an Oswego paper.

It affords us pleasure to learn that the Welland Canal is gradually coming into greater use as a means of transit from Lake Erie and the vast Lakes and territory beyond it to Lake Ontario and the St. Lawrence. Though distant from us, we cannot fail to participate in the advantages of its success. In a few years hence we may safely prognosticate, that the Welland Canal will be no trifling feeder to the stream of commerce which will flow through our city to the other parts of the world.

By the following Monthly Report, it will be seen, that the business of the Canal is on the increase, and that there is a balance of £250 in favor of May, 1835, over the same month of 1834. There is a very great decrease in the export of flour and provisions, owing to the deficiency of the crops in 1834: but the increase in the export of other articles, and of merchandise imported, have augmented the Canal revenues beyond the corresponding period of the former year.

The powerful causes which are stated as being at present in operation to restrain the trade of the Western Country from falling into the natural channel of this Canal, as they are artificial, cannot reasonably be expected to be of long duration. The interest of private individuals will soon lead to the breaking up of so expensive a monopoly.

#### Monthly Report of the Board of Directors of the Welland Canal Company.

The Secretary reports the following Comparative Statement of Property passing through the Canal, in the months of May, 1834, and 1835, and the Tolls received thereon:

Articles.	1834.	1835.
Flour.....	4,330 barrels.	2,721 barrels.
Fork.....	5,872 do.	3,016 do.
Whisky.....	102 do.	291 do.
Salt.....	8,244 do.	6,146 do.
Wheat.....	25,840 bushels.	56,759 bushels.
Pipe Staves.....	17,900 No.	84,339 No.
West India do.....	0 No.	18,479 No.
Square Timber.....	3,550 cubic ft.	57,311 cubic ft.
Boards.....	204,484 feet.	226,395 feet.
Saw Logs.....	2,574	5,925
Beer and Cider.....	0	374 barrels.
Shingles.....	0	8,000
Barley.....	0	1,748 bushels.
Gypsum.....	0	1204 tons.
Tobacco.....	37 hds.	112 hds.
Merchandise 437 tons 17 cwt. 2 q. 707 tons 15 cwt. 2 q.		
Amount of Tolls received to May 31, 1834, 672 11 64		
Do. do. do May 31, 1835, 922 15 2		
Increase.....	£250 3 78	

Which, considering the season, presents a very satisfactory result.

From the information obtained by corresponding with those interested in the Trade, there is a very great diminution in produce for export, from the Western country. It appears the effects of the snow storm and frost on the 15th May, 1834, were far more injurious, and extended through a much greater range of country, than was anticipated.—Perhaps the loss of one fourth of the entire crop may not be an over-average, together with all the fruit, and the greater part of the nuts, such as acorns, beech nuts, &c. the loss of which can only be appreciated by those farmers, in the back country, having extensive droves of pigs. The farmers on the American side, are in the habit of threshing out their grain in the fall, and sending off all, except an immediate supply for the use of their families; which had a tendency to increase the general scarcity on the western side of those lakes, and created a demand for almost all the surplus on the

Canadian side—consequently, very little produce can be expected to pass the Canal until the fall crops come in.—A very great increase of merchandise may be expected; and those interested in the navigation of this route, hold out the most flattering prospects for another season.

The only thing required, is to make the Canal a perfect navigation. Practical experiment has proved, what was always held out theoretically, that the natural local facilities presented by this route, would eventually command the trade of the Western country. It is true, many unforeseen causes have arisen to retard this result.

The trade of the Western country had been well organized and concentrated in Buffalo—many enterprising men were embarked in it, with any amount of capital they pleased to command—their lines were extended, on the opening of the Ohio Canal, to Portsmouth, on the Ohio River—and those Companies, together with the Mill-owners at Rochester, Black Rock, and the entire line of the Erie Canal, make extensive advances on produce, and secure it before its removal from the owners in Ohio—while we, on this side, being destitute of capital, and the consequent material to convey produce; unaided by capital and enterprise, which might naturally be expected from Montreal, must patiently wait until means are devised to place capital within our immediate reach—when the temporary and artificial trade heretofore wrested from us, will be restored to its natural channel.

The merchants of Oswego are an exception—they can command a capital proportionate to their numbers; and with a degree of enterprise and judgment which the command of capital generally insures, have built and are building, a large class of vessels—last year they proved profitable, and will, in all probability, continue to do so, as they command as much business as they are capable of performing.

The Board, feeling the importance of placing this navigation in the best possible state of repair, on a scale commensurate with the object, have entered into contracts for the delivery of the necessary materials to re-build such locks as may require it, and extend their dimensions to 24 feet, with a view of ultimately extending the whole to that scale.

The navigation will be kept open the present season, as long as vessels may continue to navigate.

By order of the Board,  
JOHN CLARK, Sec.  
Welland Canal Office,  
St. Catharine's, July 1, 1835.

THE ISLAND OF NEW YORK.—We understand it is ascertained by actual survey, that this Island comprises thirteen thousand acres, and it is estimated that one thousand acres will eventually be added to it by extending into the rivers and the filling up of marshes.—The first thousand acres is comprised in the line below Grand street, from river to river—from Grand street to twenty-first street there are two thousand acres. In these 3000 acres, it is supposed there are yet vacant lots sufficient to accommodate not only the whole present population of the Island but enough more to make up the number of 300,000—or the number of 100,000 inhabitants to one thousand acres, allowing about the same density of population that now exists below Canal street.—It may be seen from this, that the whole Island is capable of accommodating nearly a million and a half of inhabitants—and if our population continues to increase in the same ratio it has done for the last 30 or 40 years, the Island will be filled to its whole extent, in a period of less than half a century.—[Mercantile.]

The officer who pursued *Bowen* the smuggler, in a pilot boat, to England, returned in the Virginian,

re infected, that is, without executing his object, as indeed it was perfectly certain before he started, that he would, unless, indeed, he had overhauled the ship in which *Bowen* was a passenger, on the high seas.

Application was made to the Secretary of the Home Department, for a warrant to arrest *Bowen*, but it was refused, on the ground that no treaty stipulations required such a course, and without them, it was wholly inadmissible; and in England, a man, however criminal, cannot be kidnapped under the forms of law, as we have instances of, in this country.

FIREMEN'S GUIDE.—A map of the city to 21st street has just been published by Desobry, 131 Broadway, under the direction of the Corporation, showing the fire districts, fire limits, public cisterns, stations of engines, &c., and an explanation of the direction of a fire, as indicated by the striking of the City Hall Bell:—

The city is divided into five districts, which are pointed out by the bell as follows:

- 1st District—One stroke of the bell.
- 2d District—Two do do.
- 3d District—Three do do.
- 4th District—Four do do.
- 5th District—A continual ringing.

The first District is comprehended by a line from the foot of Murray street to the City Hall, and in a line from the N. W. corner of the City Hall, parallel with the North River to 21st street.

The second District is bounded by the latter line, and a straight line from the Hall to the 3d avenue at 21st street.

The third District is bounded by the latter and a line from the City Hall to the East River above the Dry Dock.

The fourth District is bounded by the latter, and comprehends all the space between that and the East River as far down as Frankfort street.

The fifth District is all that part of the city below Frankfort and Murray streets.—[Commercial.]

[From the Globe of Wednesday.]

GENERAL NAVAL ORDER.—As a mark of respect to the memory of CAPTAIN WOLCOTT CHAUNCEY, late of the United States Navy, who died at Pensacola, on the 14th inst., while in the command of the Navy Yard and Station at that place, the flags of the Navy Yards, Stations, and Vessels of the United States Navy will be hoisted half-mast, and thirteen minute guns fired at noon on the day after the receipt of this order.

Officers of the Navy and Marine Corps will wear crape for thirty days.

MAHLON DICKERSON.  
NAVY DEPARTMENT, 27th Oct., 1835.

THE SURPLUS REVENUE.—The large amount of the surplus revenue for the present year, and the prospect of a still greater one for the succeeding year, is attracting the attention of the public. In addition to the regular surplus of the next year, there will be six and a half millions of U. S. stock, with which something must be done. Ways and means must be thought of to get clear of it. We have heard it suggested that no inconsiderable portion of it might be employed in procuring materials, &c. for the augmentation of the navy; and when we saw the advertisement (which will be found in our paper) of proposals for the supply of live oak timber for

- 5 Ships of the line,
- 6 Frigates,
- 5 Sloops of war,
- 6 Schooners, and
- 2 steamers,

we did not know but that some of this might be in anticipation; but on inquiry we found it was founded on the regular and usual appropriation for that purpose. If the usual appropriation can go on procuring timber at the above rate, there will be no necessity of any great increase of appropriation in that way.—What is to be done with the surplus Revenue?—[Washington Telegraph.]

MONUMENT TO PERRY.—We learn, with much pleasure, that the project of a monument to the lamented Perry, to be erected in this city, has not been lost sight of, and will not be abandoned. The surviving companions of that gallant spirit deem the thing due to his memory, and are determined to see it accomplished. They will not lack aid in their undertaking.—[Buffalo Journal.]

FAIR OF THE AMERICAN INSTITUTE.

This splendid display of that spirit which is constantly urging our yet infant nation still onward in the march, or rather flight of improvement, has now closed; and it is not enough for us merely to say, it has not only exceeded the most sanguine anticipation of the most enthusiastic American patriot, but it has surpassed any thing which could have been believed, had it been predicted. The official Report is in detail before the public; but we deem it not only a privilege, to which we are entitled, but a duty we owe to our readers to present them, in our own way, our own opinions, comments and remarks, if not on every article, at least on some of those we considered most particularly worthy of notice.

In estimating the respective value of the productions of human ingenuity and industry, we should place in the first rank, and at great distance before any others, those which increase the productiveness of human labor. He who, by his ingenuity, can contrive, in any branch of labor, in which ten thousand people are employed at one dollar per day, to produce the same effect by the labor of one thousand, or ten times the effect produced before, by the ten thousand; if he does not deserve all the increase his ingenuity has produced, he certainly deserves, and well deserves, an immense pecuniary reward, together with the grateful thanks and the cheering applauses of mankind. But it is painfully true that exactly the reverse is generally the case. The authors of far the greater number of labor-saving inventions have met no reward but poverty and contempt.

The next in order of merit is he who, by his ambition to excel, produces the fairest and most improved specimen, or the greatest quantity, of any article contributing to the comforts, or the innocent pleasures, of life. The agriculturist, who can exhibit the most improved article in his line, either animal or vegetable; or the manufacturer, who produces the most valuable sample of cloth, or any other manufactured article, ought, certainly, to be rewarded and respected accordingly; but no person of sense will contend that the man who produces the largest and fattest ox or swine, or the finest and best article of clothing, can rank, in the scale of merit, with him who has contrived means to make the same labor, in producing these articles, yield ten or a hundred-fold.

The next degree of merit, we consider, (though our judgment may by some be called in question,) belongs to the persons whose genius and refined taste serves to increase and improve the embellishments of life.

With these remarks, we shall give our notices of the various exhibitions at the Fair accordingly.

LABOR-SAVING INVENTIONS, AND IMPROVEMENTS IN MANUFACTURES.

*Shaw's Patent Threshing Machine and*

*Horse Power.*—Presented by T. L. Pollard & Co., Albany. There is probably no other branch of labor which has been the subject of so many patented inventions as Threshing; and there are so many constructed on the same leading principles, that it would be impossible to tell with any certainty, which is entitled to preference, or for the patentees of a dozen or twenty, to point out how their respective Machines differ from all the rest. But it is a fortunate circumstance, that those of late invention are nearly or quite all good. Mr. Shaw's is among the number, and for aught we can see, as good as any. The Horse Power seems to present the greatest difficulty, and in this, we think Mr. Shaw's as good, and perhaps better, than any others; as it will operate with as much certainty, with as little power, and at less expense, and being less complicated, is less liable to disorder; and we are not afraid, therefore, to recommend it to any farmer.

*Fitzgerald's Grinder, and Threshing Machine.*—This Grinder consists of the frustum of a cone, of French burr, which runs on a horizontal axis in a conical hollow case of the same material, which is in two halves, the one stationary and the other moveable. We saw it in operation by a single horse power, and it made flour of the first quality, and we should say half as fast as a common grist mill, with a full head of water. It must need be an excellent article where large grinding establishments cannot conveniently be come at, and for many uses where they can.

The Threshing Machine is a good one, but we shall make no comparisons in that article.

*Walter Hunt's Patent Forest Saw.*—We cannot better describe this article than in the inventor's own words. "A simple, effective Machine, designed for felling trees and cross-cutting their trunks for lumber; and also, for the purpose of clearing wild lands." We consider this an article of peculiar value for the following reasons: First, we are confident trees may be felled with it as fast, and we think faster than with the axe. Second, It may easily be carried and used by one man,—its weight being only 30 lbs. Third, It will cut nearer the ground than can conveniently be cut with an axe, and of course leave the stumps lower. Fourth, By felling trees with the axe, the trunks are often split near the ground, and valuable timber spoiled, which will not be the case in sawing. Fifth, Its cheapness puts it within the reach of every man engaged in lumber.

*Throstle and Speeder, for Roving and Spinning Cotton.*—Made at the Oldham Works, one mile from Paterson, N. J., under the direction of B. Brundred, and exhibited by Samuel G. Wheeler & Co., 42 Pine street, New-York.

These Machines exhibit some improvements in the principles of their construction; but the points which most strongly

recommend them, are excellency of workmanship and materials, in both of which they are truly elegant, without superfluity; and we do not believe they can be surpassed in correctness of operation.

*Washing Machine.*—Invented by A. W. Soule, and another, by William Niffin.

We have seen many patent Washing Machines, and each declared by the inventor or vender, to be far superior to any other. We will venture to say, that the two above mentioned are both good, and probably that they are equal to any we have seen.

*Improved Drill.*—made by D. B. King, of Waterford. The importance of a discovery is in no direct proportion to the magnitude of the object discovered. This little diamond is worth a whole quarry of granite, though the latter is valuable; and in such proportion we consider the value of this little invention of the Drill. Every good Mechanic will feel the same pleasure, when it meets his eye, that a skillful connoisseur in the article would feel on finding a valuable diamond.

*Machine for Making Staves.*—invented by Philip Cornell, of New-York. As a hand labor saving invention, we have some doubt whether this Machine has any superior; and it does its work in a style which hand labor cannot imitate, without an immense sacrifice of time. It not only finishes, ready to put together, of any suitable timber, from 200 to 400 Staves per hour, and which need no dressing off, after they are set up, but it effects a vast saving of timber, as one Stave is taken in its finished state, directly from the side of another, without any intermediate waste.

*Machine for Cutting Lath.*—We can truly say of this Machine, that for operativeness, simplicity, and cheapness, it can hardly be surpassed. It cuts from 60 to 80 Lath per minute, and as they are cut off smooth at one stroke with a sharp tool, their quality is improved, and there is no waste, even of a saw-calf.

*Improved Clock.*—made by George Gaines, at Seneca Falls, and exhibited by E. W. Adams, the Proprietor. We had neither time nor opportunity to examine in detail the improvements in this beautiful specimen of Clock work. But we saw enough to convince us, that its plan is superior to any other now in use, as an accurate time keeper, either for private houses, or for churches and other public buildings, and we hope and trust that both the inventor and the proprietor will meet liberal encouragement from the public, which we think they certainly merit.

*Improved Theodolite.*—made by Ewin & Keartle, Baltimore. Invented and exhibited by Samuel Stone. We cannot do justice to this splendid invention, as well as elegant specimen of workmanship, in the brief catalogue we are giving, so well in any other way, as to let the inventor speak for himself—we therefore give his own words,

"This Instrument embraces all the principles of a Modern Theodolite: besides which, it contains the following improvements—The first improvement is a circular revolving plate, sliding or resting upon the limb of the instrument. The upper surface of which forms a plane with the upper surface of the limb; on which are delineated a set of Mathematical numbers, which supply the place of a Table of Logarithms, and all other logarithmic tables.

"In the second place, this Instrument is so constructed as to supersede the necessity and use of a Chain in all cases. The distance of any visible object can be ascertained at one station, as far as a flag staff can be distinctly seen through the Telescope of the Instrument, to the exactness of chains, links, and decimals.

"It also calculates the Latitude and departure of every course run, and the base and perpendicular of all elevations. It further embraces all the fundamental rules of common Arithmetic, viz: Multiplication, Division, Single Rule of Three, Interest, Mensuration of Superfices and Solids, Gauging, &c. Any question in plain Trigonometry, right angled or oblique, can be solved on the Instrument correctly; including all questions that can be performed by Logarithms or Logarithmic Tables. The whole without the use of figures or a mathematical calculation."

*Cheese Press*, invented by S. Kibbe. This is the best plan of a Cheese Press we have ever seen.

*Mowing and Grain cutting Machine*, invented and exhibited by Capt. Alexander Wilson.

In estimating the value of this labor-saving Machine, it is necessary to consider the quantity and quality of the labor saved by it. It is well known that cutting down grass and the different kinds of grain, is far the hardest and most extensive, as well as expensive branch of labor in the whole catalogue of farming operations; and that it has to be performed at the critical moment when in season; and the farmer is often, thereby placed at the mercy of his hired laborers, who always charge a higher price for it than for other labor, and at times take undue advantage of the employer's necessity.

Now, if this Machine answers the intended purpose, and we can see no reason why it should not, the farmer, instead of complaining, that though the "*harvest is plentiful, the laborers are few*," can dismiss eleven of his twelve laborers; saving not only all their wages and food, but all the liquor they drink; or, if he feel a charitable disposition to employ the poor, he can by the money so saved, extend his fields to ten or twelve times their present size, and increase his stock, and consequently his wealth, accordingly. Capt. W. calculates that this Machine, with a man and horse, will do the work of twelve men in cutting either grass or grain.

His plan appears to be simple and well digested; and if it should be susceptible of improvements, as he is himself a farmer, there can be no doubt that the head which has conceived the plan thus far, will be able, by the light of experience, to perfect what appears, at least to us, to be so ingeniously begun.

*Machine for Sawing and Jointing Shingles*, invented by David B. Moore.

We have seen several Machines for sawing and jointing shingles not very dissimilar, possibly the same. We think, however, this has some improvements; at any rate, this is a good Machine. The exhibitor states that it will make 10,000 shingles per day with a 5 horse power, which is probably the case. It would, therefore, in a place where there is plenty of timber, and a sufficient water power, be a valuable and profitable article. The cost is \$100.

*Double-Acting Bellows*, invented by Chas. D. Holmes.

This will be a valuable article, where a continuous and steady blast is wanted, either on a large or small scale. It occupies but little space, is not expensive, and cannot fail to effect the purpose.

*Locomotive Chair*, for people incapable of walking. By James Grey, Brooklyn.

This is a valuable invention for persons unfortunately deprived of the power of walking. It is a handsome mahogany chair of compact size, and the machinery by which the person moves it with either hand, is not only simplified to its lowest terms, but is truly ornamented. Mr. G. is, as far as we know, the first who constructed such a chair, and his improvements are the result of 15 years' experience.

*Double-acting or Continuous Pump*, for the use of houses, stables, &c. By Dudley L. Farnham.

This article is not new, though the patent has not yet expired: we have known it some years, and still know it as an excellent article.

*Patent Churn*. By Francis Lane.

This was the most simple looking article exhibited at the Fair; and yet we presume not only every lover of good butter, but every one who recollected as we well recollect, the many and painful hours spent in boyhood at the tedious labors of the Churn, when ever and anon, the relaxed sinews of industry received new stimulus from the cheering (not to mention fretting) admonitions of the good mother, prompting us to perseverance, and who saw this Churn, must have felt, as we felt, a peculiar glow of satisfaction as he passed it. We have seen patent churning machines tortured into every earthly shape except that of a real Churn, and adapted to all sorts of purposes but churning; but this was none of them. It was no machine at all, nothing but a couple of the real old churns of the days of our childhood, and each making the other go of itself, without the application of any power which would tire a child.

*Patent Roastmeat Jack*, made by Edward Shepherd, Paris, Oneida county.

This is a very ingenious and simple contrivance to turn, by clock work, a spit for roasting meat. When cooking is done on a large scale, we should consider it a very valuable article.

*Improved Shears*, made by David Ward.

These Shears, which were exhibited in a case with a lot of the most elegantly finished Shears we have seen, were on a plan which we should think a very great improvement, where several thickness of cloth are to be cut through at once. By a combination of levers, so light and so ingeniously contrived as to be no more unwieldy to the hand than common shears, a power is gained sufficient to cut through forty thickness of cloth without straining the hand.

*Morticing Machine*, invented and exhibited by George Page, of Keene, N. H.

This is one of that family of inventions which seem actually combining together to turn labor into sport, and at the same time, to increase its productiveness as if by magic. It has been exhibited in operation most of the week, morticing table legs, bedstead posts and other articles—made 16 mortises in a minute—makes them straight or circular, or oblique to any angle; will mortice a 14 spoke hub in 5 minutes, and all with more accuracy and neatness than those made by hand.

The price of the Machine, with a set of 6 chisels, is \$90. He has also a machine for making mortises in framing a building, with nearly the same despatch. We should think no man, whose business embraces making mortises in wood, would be long without one.

Another *Morticing Machine*, by Richardson and Dennis, is doubtless a good article, but we did not see it in operation. But a little the most marvellous specimen of labor saving, or rather labor annihilating, we saw, was a brace of

*Machines for making Biscuit*, made and exhibited by J. & C. Bruce.

One of these Machines is for large and the other for small biscuit. The small one is calculated to mould in the most perfect manner, and to bake and complete at the same time 48 in a second, or 2880 in a minute, or to go a step farther into the marvellous, 162,800 in an hour. Or, to tell the whole story in few words, he will, in one hour, convert about 18 barrels of flour into good and wholesome bread. The baking part of this Apparatus was not exhibited at the Fair. We are, therefore, not authorized to vouch for the report of this part of the invention. Of the rate of moulding we had ocular demonstration. The inventor assured us that his plan comprehended the baking as well as the moulding, and that he had it perfectly matured, though it was not exhibited.

To pass over all other considerations on

the Bread-Making Apparatus, we should think its importance at sea, and in war, enough to enrich, if not immortalize its inventor. A given quantity of flour takes up less room in storage than the same baked into bread. In long voyages at sea, instead of barely preserving the spark of vitality, by gnawing upon a dry and mouldy substance, which, perhaps, was once bread, but is now the habitation of myriads of noisome insects, the health of a crew will no doubt be promoted, independently of the comfort, by good and wholesome bread every day, or at farthest once a week; and the same benefits will result to an army on land.

The whole expense of this wonderful Apparatus, sufficient for a ship of the line, will not exceed \$100, and the space it will occupy is so small as to be of no consequence. Who can tell why this does not meet with encouragement?

**Arnold's Patent Machine for Making Twisted Roving.**—The several inventions for making Rubbed Roving, and the preference given to that kind of Roving, except for fine twist, have nearly superceded the use of Twisted Roving altogether in this country. But in spinning cotton from 60 hanks to the pound upwards, Roving is doubtless to be preferred with some twist; and as we are constantly progressing towards finer fabrics, we think this speeder may become a valuable article. Such is the opinion we formed, in the absence of any one to explain it.

**Hamilton's Machine for Sawing down Trees.**—This article stood in the Fair by the side of, and of course in competition with, that of Hunt, and we noticed the preference alternately given to each, by the multitude who examined them. But these opinions weighed nothing with us. We assume the right to judge for ourselves. There were some strong points, respectively, in favor of each. Cheapness and portableness were in favor of Mr. Hunt's Machine. The effect of the fly wheel, to equalize the resistance to the power applied, was in favor of Mr. Hamilton's. The former is the application by hand, aided by a lever, and spring of the saw, directly to the tree. In the latter the saw hangs upon a frame, swinging upon a pivot, operated upon by a crank and fly-wheel, and pressed forward to its work by a weight. We shall appeal to the decision of time and experience, for a decision as to their relative value.

**Blowing Machine.**—This is an ingenious contrivance, by Mr. Brundred, of the Oldham Works, near Paterson. It consists of the frustum of a cone surrounded with spiral fans, which being inclosed in a conical shaped case, the air is converged and forced out at the small end with any force, according to the propelling power. It will prove a useful thing.

**Model of a Spiral Reacting, or Tub Water Wheel.** This is one of a numerous family of Water Wheels, varying but little

from each other, and which we think is as good as any we have seen of the kind. They are importantly useful in certain situations.

**Improved Stoves.**—This is a very important subject, and worthy to engage, as it has engaged, the most eager emulation. But the competitors are so numerous, and so many important improvements have been exhibited, that it would be difficult if not impossible to award the victory with justice to any one. At this Fair there were 80 different stoves exhibited. The preference in this department of invention has been generally given, and we believe justly, to Dr. Nott. But it seems impossible for one man to run so fast in any race but that another may equal him. We had not an opportunity to examine critically the merits of each stove, but we think the claims of Mr. James Wilson, of Mr. Parmelee, and of Mr. Parker, entitle them to a candid examination.

**Bee Hives.**—Among the numerous useful improvements, we saw none more entitled to patronage than the bee hives, exhibited by Messrs. Parish and Kelsey. Both their plans were good. We were instructed and amused by the practical knowledge of Mr. Kelsey on the subject, a degree of knowledge which few men would have patience to acquire; we intend to profit by Mr. K's instructions, but we prefer the live exhibited by Mr. Parish. We hope the labor and examples set by these gentlemen, will put an end to the shameful practice of destroying these industrious little creatures with fire and brimstone.

**Printing Press.**—The hand Printing Press of M. L. Kingsley, embraces some improvements in simplicity and facility of working; and notwithstanding the overwhelming importance of the double or single Napier Press, we think this still has its usefulness, and is entitled to respectful notice.

#### MANUFACTURES.

As it is proper to commence with the most valuable articles, we will select Mr. Pemberton's Improvement in Gold. Mr. P. has succeeded in effecting a perfect and solid union between pure gold and pure copper, and between 18 carat gold and a composition very suitable for various purposes, in so perfect a manner that a bar plated and drawn down will answer an infinite number of purposes, in all respects as well as solid gold. The Buttons exhibited by Mr. P. manufactured in this way, are in all respects, for use and beauty, superior to buttons of real gold, as the metal on which they are plated is more substantial, and all that can be seen is gold. The same, when plated on both sides, may be said of the Watch Cases—and we might add, many other articles.

**Silver Ware.**—The specimens of Silver Ware exhibited by Mr. Marquand, 181 Broadway, and Mr. James Thompson, 129 William-st., produced the most agreeable astonishment, especially to us, who well remember when to produce a common Silver

Buckle in this country, was a thing viewed with utter astonishment.

**Articles of Copper.**—We saw several elegant articles of Copper, which we thought quite as worthy of attention, and as useful as those of gold or silver, though the material did not cost so much.

We will next notice some articles chiefly of Steel and Iron, which we consider to be of still more intrinsic value than those made of any other metal.

We will begin with the beautiful specimens of *Edge Tools*—consisting of Chisels, Gouges, Drawing Knives, Broad Axes, &c. &c. Superior in finish to any imported ones we have seen, and we trust no less so in temper, as they were manufactured by Kennedy & Way, of Hartford—in the senior member of which firm we recognize an old friend, whose ingenuity, in that line, as well as honesty and patriotism, we have witnessed in days of "Lang Syne."

**The Wood Screws,** by Messrs. J. G. Pier-son and Brothers, are far superior to any imported articles of the kind we have seen.

The Case of elegantly finished *Shears*, of somewhat varied descriptions, but above all the pair with increased power which we have already described, are elegant indeed.

Another valuable item was *Hinges*, of various descriptions—a most superb article.

**Door Locks**—and various other articles composed of metal, all of which were superior to any thing of a similar nature which we have been accustomed to meet with.

**Watch Dials**, of rich and superior beauty, by Mr. Mullen, 175 Broadway.

**Sheet Brass**, manufactured at Waterbury, Connecticut—a very important article, and of excellent quality.

**Sheet Zink**, in very large sheets.

**Razors, Penknives, Shears, and other Cutlery**, in as high perfection as ever graced a show-case, by Robert Ward, 142 Fulton-st.

Another sample, of similar character, by William Wild, 142 Fulton and 162 Division street.

**Augers**, and various instruments for boring, of the most improved form, and exquisite workmanship.

A splendid lot of *Joiner's and Cabinet Maker's Tools*, such as an ambitious young man might feel proud to work with, and such as twenty years ago were never seen on this side of the Atlantic, and perhaps rarely on the other, by A. & E. Baldwin 404 Broome street.

**Scales and Scale-beams**, of the most improved forms and finished workmanship, by D. H. & S. Nichols.

In the line of *Clothing*, we can only say collectively—there was a universal assortment composed of every material, except *Silks*, which we have every reason to believe will form a brilliant climax to the display another year. The exhibition of *Broadcloth, Cassimers, and other Woollen Goods*, left apparently but little room for future improvement. One piece of *Black*

*Cloth* in particular, without any disparagement, to the rest, was for excellency of finish, and particularly for its silky softness, a proud article for our country, or any other. It was made by C. A. Beecher, Waterbury, Connecticut.

In *Cotton Goods*, the display was highly respectable, consisting not only of almost every article of undyed Cotton in use, but of dyed and printed Goods, of exquisite beauty. The printed Muslins and dress, and furniture Calico, from W. Robertson, of Fall River, did credit to the Manufacturer, and to the country.

The *Cut Glass*, from W. T. Morton, of Baltimore, was as near perfection as our fancy can reach.

The specimens of *Bookbinding and Blank Ruling*, were beautiful indeed—if they can be surpassed it would be needless.

The various articles of *Cabinet Furniture*, some displaying superior workmanship—some improved form, and ingenious contrivances for convenience, and some both, were well worth their price, to those who can afford to buy them, and a gratifying treat to us who could not.

With respect to the *Piano Fortes*, and other stringed as well as wind Instruments, we can only say, in general terms—they were a superb display, but we were not surprised nor astonished, for we expected to find them so. It is to be feared they have left no room for improvement another year.

We must not forget, as a specimen of American manufacture, a *Bolt of Duck*, a most substantial and well finished article, by our valued friends Amos Briggs & Co. Scaghticoke.

Various articles of *Indian Rubber* were exhibited, which were not only valuable in themselves, but much more peculiarly so, as they pointed to an immense, but yet unexplored field of future improvements, of which that article is to form the foundation. The little net-covered globes, or parlor balls, exhibited by H. Percival & Co. must certainly furnish an all-important hint to the Aeronaut. But at any rate, we have no fear in predicting that the hundredth part of the uses of this long neglected article have not yet been thought of.

The specimens of *Crown Window Glass*, from Redford, and from Brooklyn, certainly bid defiance to any other country in that line. As they stood in a bad light, we could not decide which was entitled to the preference, if either; but either of them far surpassed any imported Crown Glass we ever saw.

There were some beautiful specimens of *Swords*, but as we profess to belong to the peace party, we hope they will never come into general use.

*Relief Bed for the Use of the Sick.*—Among the numerous and successful displays of inventive genius, we saw nothing which merited more grateful applause, or a more liberal reward, than the above article, invented by Mr. Jones, of Providence, R. I.

Mr. J. states that he has been employed a great number of years in attending on the sick, and that the plan he has presented has been suggested by necessity, and improved and directed by his long experience, and it may be truly said his services confirm his statement, and do credit to his genius.

By this wonderful contrivance, whilst a sick person may be lying horizontally and asleep on it, the upper part of the bed may be elevated to any angle required, and, if necessary, lowered again to the same position—or the patient may be raised from the bed altogether, and swung off by a crane, at the head of the bed, while the bed is made, and then put back on a fresh made bed, and all this without sufficient jar to awaken the patient from the most delicate and watchful sleep.

Whenever the state of the patient requires, or admits of sitting in a chair, the bed may be immediately transported into an easy chair, and back again in a moment, when required, to a bed, in so gentle a manner as not to give pain even to a broken limb. Should the patient be delirious, even to the most raving maniac, this same soft bed is in an instant made to supercede the use of the straight jacket, by confining the body, head, and even the limbs, in the most perfect stillness, and without the slightest pain; and in addition to all these conveniences, the necessary calls of nature may all be attended to with the most perfect cleanliness, and without the slightest movement of the patient.

Who would not be willing to reward so much ingenuity applied to such a purpose?

We have now enumerated, with occasional remarks, those articles which we thought most important; especially the most useful. To go into an entire detailed description of the several hundreds of fancy and minor articles, though many of them were useful, and all perhaps displayed ingenuity, and a spirit of enterprise which deserves encouragement, yet we think it would occupy too great a portion of our pages, which our readers would decide might be appropriated to better use.

We shall notice, when we have leisure, and room in our pages, some of the foregoing articles, more at length, and give engravings in cases where we can obtain them.

[From the Albany Argus of Saturday.]

**COMMON SCHOOLS.**—According to the notices that had been given, a large and intelligent audience assembled on Thursday evening, in the Female Academy, when the meeting was called to order by Gideon Hawley, Esq. who moved that his Excellency, Wm. L. Marcy, be chairman of the meeting. The motion was unanimously adopted. Mr. Hawley then proposed that Thos. W. Olcott be the secretary of the meeting.

The Governor then rose, and after introducing Mr. Taylor to the audience, made some pertinent remarks on the importance of the great subject before the meeting. He stated that he was highly pleased to hear of the benevolent efforts of some of our truly patriotic citizens who had sustained this mission among our common schools, and that he was gratified with the privilege of now hearing some of the results of Mr. Taylor's tour.

Mr. Taylor then addressed the audience for more than an hour, in a practical style, manner and thought, which made a deep impression upon the audience,

and which showed that the speaker was fully acquainted with his subject. The friends of education felt that great good to our common schools would arise from Mr. T.'s investigations. It is understood that the facts and results stated in the lecture will be published in a report, hereafter to be made to the patrons of the mission, and we shall therefore omit giving the purport of the lecture.

#### Census of New York.

The following is a correct estimate of the present inhabitants of this city—being an abstract of the Census recently taken:—

WARDS.	1st	2d	3d	4th	5th	6th	7th	8th	9th	10th	11th	12th	13th	14th	15th	Total
Number of male persons in each ward.	5338	4365	5469	5663	8401	8949	10081	12979	9901	10046	12865	13198	13071	8130	5883	131,592

Ninth Ward, 2,244

3,996  
67,384

The Fifteenth is a new Ward, taken from the Ninth, which accounts for the decrease in the latter.

The total increase in the last five years, is a fraction more than *thirty-three per cent.*

Number of neat cattle in the city and county of New York, 4062; number of horses, 10,712; number of sheep, 416; number of hogs 11,879;—number of yards of linen, cotton, or other thin cloths, manufactured in the domestic way during the year preceding, 668,000—the whole of these manufactures being in the Twelfth Ward. Number of cotton factories 5; all in the Ninth Ward.—The value of the raw materials used and manufactured in these factories is \$202,800—the value of the manufactured articles \$271,600—the number of yards of cotton cloth 672,000. There is one woollen factory in the Tenth Ward, using and manufacturing \$15,000 worth of raw materials, the value of the manufactured articles being \$23,000. There are 11 iron works—1 in the Second ward, 3 in the Sixth ward, 4 in the Tenth ward, and 3 in the Fourteenth ward. The value of raw materials used and manufactured in them is \$130,250—the value of manufactured articles is \$348,050. There is 1 trip hammer in the Tenth ward; value of the raw material manufactured \$17,000; value of the manufactured articles \$21,000. There are 9 distilleries—value of raw materials \$532,527; value of manufactured articles \$659,067. Two grist mills; value of raw materials used \$108,000; value of manufactured articles \$130,000. Five saw mills; value of raw materials \$311,360; value of manufactured articles \$417,210. Paper mill—1 in the Seventh ward; value of raw materials \$8000; value of manufactured articles \$10,000. Tanneries—5 in the Fourth ward, 3 in the Seventh ward, 1 in the Eighth ward, and 1 in the Thirteenth ward; value of raw materials \$23,855; value of manufactured articles \$55,260. Breweries 10—in the Fourth ward 2, Fifth ward 2, Seventh ward 1, Eighth ward 1, Ninth ward 1, Tenth ward 1, Thirteenth ward 1, Fifteenth ward 1; value of raw materials \$152,475; value of manufactured articles \$228,505.

Messrs. Davis and Miller, the agents despatched to England in the Pilot boat Aymar, in pursuit of Bowen, the smuggler, returned on Monday in the Liverpool packet, having failed in accomplishing the object of their voyage. On their arrival at Liverpool, we understand they applied to the magistracy for a warrant to arrest the fugitive, but could not obtain one. At the suggestion of Mr. Ogden, the American Consul, application was next made to Lord Palmerston, secretary for foreign affairs, but without success. In reply, his lordship stated that, as no compact existed between Great Britain

and the United States, authorizing the surrender of fugitives from justice, the redress sought for in this instance could not be granted.—[Courier and Enquirer.]

ORDER } HEAD QUARTERS OF THE ARMY,  
No. 80. } Adjutant General's Office,  
WASHINGTON, Oct. 31, 1835.

1.—PROMOTIONS AND APPOINTMENTS in the Army since the publication of "Order" No. 38, of July 1st, 1835.

#### 1.—PROMOTIONS.

##### Regiment of Dragoons.

Second Lieutenant John S. Van Derveer, to be First Lieutenant, 15th August, 1835, vice Hamilton, cashiered.

Brevet Second Lieutenant Henry Turner, to be Second Lieutenant, 15th August, 1835, vice Van Derveer, promoted, (brevet 1st July, 1834.)

##### First Regiment of Artillery.

First Lieutenant Lemuel Gates, to be Captain, 1st October, 1835, vice Henry Whiting, resigned.

Second Lieutenant Miner Knowlton, to be First Lieutenant, 23d July, 1835, vice Palmer deceased.

Second Lieutenant John F. Kennedy, to be First Lieutenant, 1st October, 1835, vice Gates, promoted.

Brevet Second Lieutenant John F. Lee, to be Second Lieutenant, 23d July, 1835, vice Knowlton, promoted, (brevet 1st July, 1834.)

Brevet Second Lieutenant Charles B. Chalmers, to be Second Lieutenant, 31st August, 1835, vice Harris, resigned, (brevet 1st July, 1834.)

Brevet Second Lieutenant Louis A. B. Walbach, to be Second Lieutenant, 1st October, 1835, vice Kennedy, promoted, (brevet 1st July, 1834.)

##### Second Regiment of Artillery.

Brevet Second Lieutenant Charles J. Whiting, to be Second Lieutenant, 10th September, 1835, vice Prentiss, resigned, (brevet 1st July, 1835.)

Brevet Second Lieutenant George M. Legate, to be Second Lieutenant, 31st October, 1835, vice Vance, resigned, (brevet 1st July, 1835.)

##### Third Regiment of Artillery.

Brevet Second Lieutenant Robert R. Mudge, to be Second Lieutenant, 31st August, 1835, vice Bryant, resigned, (brevet 1st July, 1833.)

##### Fourth Regiment of Artillery.

Brevet Second Lieutenant Alexander E. Shiras, to be Second Lieutenant, 6th October, 1835, vice Petigru, deceased, (brevet 1st July, 1833.)

##### Third Regiment of Infantry.

First Lieutenant Ous Wheeler, to be Captain, 31st October, 1835, vice Loring, resigned.

Second Lieutenant Nathaniel C. Macrae, to be First Lieutenant, 31st October, 1835, vice Wheeler, promoted.

Brevet Second Lieutenant George P. Field, to be Second Lieutenant, 25th July, 1835, vice Baldwin, deceased, (brevet 1st July, 1834.)

Brevet Second Lieutenant Cary H. Fry, to be Second Lieutenant, 31st August, 1835, vice Legate, resigned, (brevet 1st July, 1834.)

Brevet Second Lieutenant Thomas O. Barnwell, to be Second Lieutenant, 31st October, 1835, vice Macrae, promoted, (brevet 1st July, 1834.)

##### Fourth Regiment of Infantry.

Brevet Second Lieutenant Benjamin Alvord, to be Second Lieutenant, 21st July, 1835, vice Manning, deceased, (brevet 1st July, 1833.)

##### Fifth Regiment of Infantry.

Brevet Second Lieutenant Thomas Stockton, to be Second Lieutenant, 31st August, 1835, vice Scott, resigned, (brevet 1st July, 1831.)

#### II. APPOINTMENTS.

##### Staff.

Brevet Major Henry Whiting, Captain in the First Regiment of Artillery, to be Quartermaster, 23d September, 1835.

Charles M. Hitchcock, to be Assistant Surgeon, 17th August, 1835.

William W. Hoxton, to be Assistant Surgeon, 24th August, 1835.

##### Regiment of Dragoons.

Cadet Abram R. Johnston, to be Brevet Second Lieutenant, 1st July, 1835, to take rank next below Brevet Second Lieutenant Hanly.

##### Third Regiment of Infantry.

Cadet Hugh McLeod, to be Brevet Second Lieutenant, 18th September, 1835.

##### Fourth Regiment of Infantry.

Cadet Henry Prince, to be Brevet Second Lieutenant, 18th September, 1835.

#### III.—CASUALTIES.

##### Resignations.

##### Captains.

Henry Whiting, 1st Artillery, 1st October, 1835.  
Henry H. Loring, 3d Infantry, 31st October, 1835.

##### Second Lieutenants.

David B. Harris, 1st Artillery, 31st August, 1835.  
Henry E. Prentiss, 2d Artillery, 10th September, 1835.

Joseph C. Vance, 2d Artillery, 31st October, 1835.  
William Bryant 3d Artillery, 21st August, 1835.

Stephen B. Legate, 3d Infantry, 31st August, 1835.  
Moses Scott, 5th Infantry, 31st August, 1835.

##### Brevet Second Lieutenants.

James N. Ellis, 1st Artillery, 19th October, 1835.  
Montgomery Blair, 2d Artillery, 10th October, 1835.

Herman Houpt, 3d Infantry, 30th September, 1835.  
Lucius Bradbury, 7th Infantry, 1st October, 1835.

##### Deaths.

Brevet Lieutenant Colonel William Linnad, Quartermaster, 20th September, 1835.

First Lieutenant William Palmer, 1st Artillery 23d July, 1835.

Second Lieutenant Charles Petigru, 4th Artillery, 6th October, 1835.

Second Lieutenant Alexander G. Baldwin, 3d Infantry, 25th July, 1835.

Second Lieutenant David A. Manning, 4th Infantry, 21st July, 1835.

Assistant Surgeon Foster Swift, 18th August, 1835.

Assistant Surgeon Robert French, 13th August, 1835.

##### Revoked.

Charles Little, Military Storekeeper, 31st August, 1835.

##### Cashiered.

First Lieutenant James W. Hamilton, Dragoons, 15th August, 1835.

2.—The Officers promoted and appointed, will report accordingly, and join their proper stations, and companies, without delay; those on detached service, or acting under special orders and instructions, will report by letter to their respective Colonels.

#### IV.—"RULE TO BE OBSERVED IN ORDINARY CASES OF PROMOTION."

3.—"If a field officer, the officer promoted will join the regiment and station of his predecessor; if a company officer, he will join the particular company where the vacancy to which he succeeds may have occurred."

By order of  
ALEXANDER MACOMB,  
Major General, Commanding in Chief.  
R. JONES, Adj't. General.

##### TRANSFERS.

Brevet Second Lieutenant James H. Stokes, of the 2d Regiment of Artillery, transferred to the 4th Artillery.

Brevet Second Lieutenant William H. Betts, of the 7th Regiment of Infantry, transferred to the 1st Regiment of Artillery.

The following gentlemen were admitted at the present term of the Supreme Court, as Attorneys and Counsellors:

Attorneys.—George K. Andrews, Walter W. Allen, Horatio P. Allen, Augustus L. Allen, Chas. H. Bramhall, John M. Bradford, Daniel A. Baldwin, George Buckham, John E. Brackett, Horatio Bogert, Lorenzo D. Brock, Howard Chipp, Solomon B. Conely, Stephen B. Cushing, Phedrus Carter, William Calkins, Ebenezer Clark, Sullivan Caverno, Alexander Fonda, Joseph Genter, Daniel Gray, Thomas Graham, Milton N. Halsey, John Howes, Augustus S. Hills, Abraham Hoes, Joseph D. Jordan, John James Kane, William H. Leonard, Edwin C. Litchfield, John L. Lewis, jr., Daniel T. Mosely, Henry B. McClure, George W. Newell, Franklin J. Osborn, Robert O. Reynolds, Hiram Riggs, Henry J. Ruggles, Charles A. Sherman, Walter W. Seymour, Allen M. Sherman, Charles Stuart, Charles W. Swift, Erasmus P. Smith, Wessel S. Smith, Gilbert M. Spier, Marshall M. Strong, Alexander B. Thompson, Charlesmagne Tower, Peter A. Van Bergen, Isaac V. Van Der Poel, Don Carlos Woodcock, Abel B. Watkins, jr., Arthur C. Southwick, John Wait, Henry P. Wamaker, Henry Whitney.

Counsellors.—Henry G. Colton, Joseph Cragoo, John L. Curtenius, J. L. Endress, Amos Gould, Joseph D. Husbands, Charles M. Jenkins, Alex-

ander Hursheedt, Robert H. Martin, Nathan Westcott.—[Albany Eve. Jour.]

**TEA IN INDIA.**—A Calcutta paper gives the following account of the discovery of the Tea plant in India, from which it appears possible that it may become an article of trade from that country.—[Boston Adv.]

**TEA PLANT.**—We understand that further discoveries of the Tea plant have been made on our eastern frontier among the Muneepoor hills, and that some specimens of the leaves have been sent down to the Agricultural and Horticultural Society, and are now in possession of Dr. Wallick.—Major Grant has the merit of this new discovery. The plant was pointed out to him in the hills by Shans, who knew it well, having visited the tea garden cultivated by the Chinese. But we are told, the specimens of the leaf, (which we have not seen,) from want of a proper curing, are not in a state to render it possible at present to judge of the quality of the tea that might be obtained in that district. In the meantime it is very satisfactory to know that the plant is common among those hills in a large extent of country, and that we have thus a double resource in our own neighborhood, which may hereafter render us independent of China for a commodity become so necessary to the comfort of Europeans, and so very important as an object of trade. The hills in Muneepoor, on which the tea plant is indigenous, must be of considerable elevation, for in a letter we have seen describing the successful result of a late harassing expedition against some freebooters, it is mentioned that, in two days' march from Sangonoo, the party found themselves among pine and oak forests, and that the nights, even in the middle of March, were extremely cold.

**LATER FROM EUROPE.**—By the packet ship *Virginia*, Harris, master, from Liverpool, we have our London papers to the 7th ultimo, inclusive—from which we make such extracts as appear of interest, though, at present, there is not much of certain intelligence respecting Spain, the chief point of attention.

The following article from the London Times of 7th October, presents a brief summary of the latest intelligence from the Continent:—[N. Y. American.]

The Paris papers of Monday, 5th October, received, with a number of private communications, by express, bring no further intelligence from the interior of the Peninsula, and as the resignation of M. Mendizabal on the 25th of September, rested exclusively on the authority of the *Memorial Bordelais*, the absence of direct intelligence from Madrid, joined to the continued silence of the telegraph on the subject, might have given to the statement a sufficient contradiction. Even the *Journal des Debats* had begun to express some reluctant doubt on the subject, and the *Moniteur du Commerce*, a Ministerial print of the same political complexion with the *Memorial Bordelais*, is the only paper published in Paris on Monday, which still professes to believe in M. Mendizabal's resignation. Starting from that point, it is pretended that a commercial crisis, the result of political anarchy, had already arisen in Catalonia. Commercial orders having been in a great measure suspended, a number of manufacturers had been obliged to dismiss the most of their workmen, and upwards of twenty manufacturing establishments at Barcelona had been entirely closed, while others had announced their intention of winding up their affairs for the purpose of escaping from utter ruin. The cotton trade has suffered more severely than any other, having attained to a high degree of prosperity under the system of absolute prohibition against the importation of cotton goods, which has heretofore prevailed in the Peninsula. The number of workmen employed in this branch alone is stated at 100,000; the annual amount of their wages at 150,000,000 reals, the amount of fixed capital expended in buildings and machinery at 180,000,000 reals; and the annual value of the produce at 325,000,000 reals. A fourth part of this trade is said to be concentrated in the city of Barcelona; and this Ministerial journal, the *Moniteur du Commerce*, is at great pains to impress on the minds of the 100,000 workmen of Catalonia, that the distress to which they are exposed, arises from the undue advantage which England has taken of the confusion which prevails in the country, by throwing into Spain immense quantities of British manufac-

tures, at a moment when it was impossible for the custom-house officers to watch over illicit transactions with their customary care.

From the returns of the French custom houses, also, there appears to have been a considerable deficit on the first three quarters of 1835, as compared with the corresponding period of former years. At Havre alone the diminution amounts to 3,644,000 francs, as compared with the receipts for the three first quarters of 1834; and at Marseilles, although the returns for September have not yet been made up, it is known that a considerable deficit arises in the receipts for the first eight months of the year. This state of things, however, is not ascribed to the influence of England, but to the non-arrival of the usual supplies of colonial sugar, arising, it is said, from a belief that the privileges enjoyed by the French colonies, make raw sugar dearer in France than in any other country.

The *Venetian Gazette* of the 23d of September announces the arrival there three days before, of Don Miguel of Portugal, who had come from Rome, travelling under the name of the Count de Ramalhao, and the *Precursor*, a Portuguese journal published in Italy, contains a proclamation, bearing the signature of Don Miguel, and dated from Rome, before his departure for Germany, in which His Highness protests against the sale of ecclesiastical property in Portugal, and against all the sacrilegious violence and usurpation in which the present Government has indulged on the subject. He promises to do all that his religion, his honor, and his love for the Portuguese people can require of him, to frustrate their designs, and when he reappears in Portugal to reascend the throne which belongs to him, he declares that he will not recognize these sales, but that he will be inexorable in causing the purchasers, whether natives or foreigners, to lose the capital they may have expended.—Neither law nor justice, he says, can give validity to such sales, nor impugn the protest he makes against them.

Our Bayonne correspondent, who writes on the 1st inst., throws discredit on a report which prevailed there of Don Carlos having clandestinely quitted his army. No authentic intelligence had been received from the seat of war since the despatches of General Evans and Colonel Wyld, of the 22d ult., and no credit was given to the account of actions said to have taken place near Oroso, 6 leagues from Bilbao, on the 30th ult.

Our letter from Barcelona of the 23th stated that despatches had been received from General Pastors, giving an unfavorable account of his operations. The greater part of a strong detachment of the line belonging to his division had been cut to pieces near Castellbo, by the Carlists.

[From the *Journal du Commerce*.]

They write from Philadelphia, under date of Sept. 7th, as follows: "Nothing new relative to the state of affairs between France and the United States. The President maintains a profound reserve. None of the ministers hazard an opinion, either that the money due by France, will, or will not, be paid. During the last absence of General Jackson from Washington, a person in conversation with him, having alluded to this question, the President said but few words, and those far from satisfactory. He expressed himself thus: 'I will never say yes or no to the French government, to ensure the payment of the money stipulated in the Treaty.'"

The London money market has become much easier.

LONDON, Oct. 6th.—The extinction of the monopoly of the East India Company, and the great increase in the exports of cotton and woollen manufactures to India, China, the Pacific, and the U. States, is rapidly attracting capital from private sources to supply the place of that establishment, and to carry on those important branches of commerce with enterprise and vigor. A mercantile association upon a very extensive scale has been formed for this purpose in the city, and is to commence, it is understood, on the 1st of January. One gentleman, a member of this firm, has, it is stated, proceeded to the United States to arrange a system of banking and mercantile operations with that country, and to form connecting links with the Pacific, Calcutta, and Canton, where establishments have already been appointed to act in concert with the London firm.

The transactions to-day in the English Stock market were unimportant, and the price of Consols remained almost stationary at 90 7-8 for the

account, and 90 3-4 for money. Omnium closed at 3 3-4, and Exchequer bills at 15s to 17s premium.

PARIS, BOURSE, Oct. 5, quarter to 4 p. m.—The Rentes have remained steady to-day, between 81f. 70c. and 81f. 75c. The Spanish stocks were looking down at the earlier part of the Bourse, on the report that M. Mendizabal had resigned; this, however, appears to be untrue, and, on the contrary, some good news having arrived from Spain, the securities have considerably improved.

It is reported that Louis Philippe is inclined to set at liberty Prince Polignac and his fellow-prisoners in Ham Castle. This is said to have been promised to M. Sauzet (who is named as likely also to get a seat in the Cabinet) for his so promptly undertaking to draw up the report on the Press Bill.

From the returns of the French custom houses, there appears to have been a considerable deficit on the first three quarters of 1835, as compared with the corresponding period of former years. At Havre alone the diminution amounts to 3,644,000 francs, as compared with the receipts for the three first quarters of 1834; and at Marseilles, although the returns for September have not yet been made up, it is known that a considerable deficit arises in the receipts for the first eight months of the year.

The *Messenger* contains the following:—"There has been a rupture among the members of the Cabinet, which is no secret to the confidants of Ministers. According to accounts we have received, the King is very much dissatisfied, and has taken several of these gentlemen at their words, on their telling him that affairs of State would not permit them to go to Fontainebleau, and consequently M. Persil will alone go there. It is added that expresses have been sent to M. Dupin, Marshal Soult, and M. Sauzet, but these personages are less likely to ally themselves with M. Persil, than with the Doctrinaires. The only alternative will be therefore to make a complete clearance, but this probably will not be done, and therefore the whole will end in a new accommodation."

PARIS, Sept. 30.—A telegraphic despatch from Calais, dated to-day, announces that the King and Queen of the Belgians have arrived here last evening, and that they embarked to-day, at 2 o'clock, for Ramsgate.

LONDON, Oct. 5.—In the churches of the metropolis yesterday, and in the chapels of the Dissenters, the "Reformation" and its chiefest and most glorious concomitant, the publication of the Holy Scriptures in the English language, were most fitly and most zealously commemorated. We are sure that as speedily as the announcements can be forwarded, we shall have to tell that the pastors, as well of the establishment as of separated congregations of Protestants, in the country, directed the attention of their hearers principally, if not exclusively, to those inestimable works—glorifying God that he was graciously pleased to put it into the hearts of their ancestors to attempt the structure of monuments of such imperishable fame, and praying that they may prove themselves worthy of the great and good men from whom they are descended, and honestly fulfil their first duty to posterity by preserving perfect, and intact, wherever the dominion of Britain extends, the fate which so many martyrs joyfully sealed with their blood.

The *Venetian Gazette* of the 22d of September announces the arrival there three days before of Don Miguel of Portugal, who had come from Rome, travelling under the name of the Count de Ramalhao.

LISBON, Sept. 26, 11 o'clock, P. M.—The obsequies celebrated on the 24th for the repose of the soul of the late Don Pedro, at the church of San Vicense de Afora, were attended by both Her Most Faithful and Her Imperial Majesties, all the Peers and other nobility, Deputies in Lisbon, the Foreign Ministers, Lord Howard de Walden, having come on purpose from Cintra; Generals, Admirals, and officers; the Council of State, the Ministers of the Crown, and by the most respectable people in town.

A slave trader has lately arrived in the Tagus, consigned to Mr. S—, a German. She returns, after having sold her slaves at Rio Janeiro and the Havana, with a net profit of 95,000 crowns, or 10,000l., after deducting every outlay, and she will soon start again on another creditable and humane expedition of this kind. There are three French residents here concerned with Mr. S— in the nefarious and infamous expedition, and, unless, our

government adopt some other course, the traffic from hence will increase.

SPAIN.

PARIS, Oct. 1.—It is said on Change that letters of the 25th from Madrid, are received, stating that the Marquis de Las Navas has placed himself at the head of the volunteers of Andalusia, and that the garrison of Madrid has departed for the army of the North. If this is true, it would seem to imply that the Constitution of 1812 had been proclaimed at Madrid.

A telegraphic despatch dated Bayonne, Oct. 29th, announces the following nominations in the Gazette de Madrid:

"Mina is appointed Captain General of Catalonia; Palefox, Captain General of Arragon; Aspinosa, of Andalusia; and Quiroga, of New Granada."

A telegraphic despatch, dated Perpignan, September 28th, announces that on the 24th General Averte beat 4000 Carlists near d'Olot. Their loss is estimated at 2000 men.

The Junta of Barcelona has declared that it will retain its power until a Captain General arrives who possesses their confidence.

A recent engagement is spoken of as having taken place between Bilbao and Vittoria, in which the Queen's party revenged itself completely. A Carlist division which attempted to oppose the march of Gen. Espeleta, suffered much loss, having been pressed on the one part by that General, and on the other by Gen. Cordova.

LONDON, Oct. 7.—Despatches dated the 28th ult., in the highest degree satisfactory to the friends of Spain and of the Government of her Catholic Majesty, were received from Madrid on Monday afternoon, at the hotel of the Spanish Embassy in Paris. The Conde de Almodovar, late President of the Chamber of Procuradores, who had placed himself at the head of the Junta Consultativa of his native province of Valencia, and who afterwards felt himself constrained to accept the Presidency of the Junta de Gobierno, although from the violence of his associates he was compelled almost immediately after to retire for personal protection on board an English vessel in the harbor, has testified his submission to the central government at Madrid, in the most unequivocal terms, by shipping off the rest of the junta to the Spanish penal settlement on the coast of Africa, while he himself at the same time has signified his acceptance of the office of Minister at War. The Junta of Galicia has in like manner sent in the unconditional submission of its members to the Queen's Government, and has at the same time pronounced its own dissolution. The Junta of Barcelona has also announced its readiness to dissolve itself, as soon as the Queen's government shall have appointed some one, in the absence of the Captain-General, to assume the command of the armed forces of the principality. With regard to the troops under the command of Las Navas, no further apprehension was entertained respecting them. As the whole secret of his strength consisted in the expression, almost unanimous, of public opinion against the administration of Toreno, it was clear that, as the provincial juntas had agreed to support the government of Mendizabal, any attempt on the part of Las Navas to push forward to the capital could only lead to his own destruction. Indeed, the cry had already been raised in Madrid, that he ought to be hanged for not dispersing his troops and laying down his arms on the first intimation of Toreno's downfall. In addition to these interesting facts, it is announced in Mendizabal's despatches, that the Cortes have been convoked for the 16th of November, in the ordinary course, under the provisions of the *Estatuto Real*, thus affording a circumstantial and conclusive contradiction to the sinister rumors so industriously spread by the organs of the French Government, if not by one of the highest of the diplomatic functionaries.

SANTANDER, Sept. 29.—The steamboat not having started as yet for Falmouth, I have an opportunity of communicating to you the news from Madrid, which is highly favorable to the new Ministry. The soldiers who were moving from Andalusia towards Madrid, stopped at Valdepenas on receiving intelligence of the change of Ministers. The nomination of Mina to be Captain General of Catalonia, that of Palefox to be that of Arragon, of Catala to be that of Valencia, of Rodil to be that of Estremadura, of Quiroga to Granada, and of Buitron to be that of New Castile, has given satisfaction to the popular party. The Queen Regent has also ordered the pay due to her husband's rank to be given during life to the widow of Torrijos,

and has paid the first instalment out of her privy purse, until the Cortes shall have sanctioned the pension as a public one.

The new Ministry was not yet fully arranged, nor was it expected to be so until after the arrival in Madrid of General Alava, which may take place towards the close of this week.

Senor Mendizabal, whose activity astonished the people of Madrid, was attacked by a severe cholera one night last week—his illness was magnified, and all the operations in the funds stopped for the day. He is now fully recovered.

The following article is copied from one of the Madrid papers:—"It is stated that one of the chief officers having applied to Senor Mendizabal to know what he ought to do with the garrison of Madrid, in case the troops from Andalusia should approach the capital 'Join together and march to Navarre; I will remain here alone with the Urbana's,' was the reply, coolly given. This answer has given satisfaction to all parties favorable to the cause of the Queen."

Addresses continue to pour in from all quarters to the Queen Regent; and the ferment of the public mind being allayed, nothing remains for the ministry, after its formation, but to call the Cortes together to make good laws, and to establish proper reforms, and to put down the rebels.

One great act of Senor Mendizabal has been to oblige the Gazette, which has long been a nonentity on political subjects, to publish articles of immediate utility in order to illustrate the public mind.

BILBOA, Sept. 25.—The British Auxiliary Legion continues in this city, where the improvement of the soldiers in discipline and in the musket is such as to give satisfaction to their warmest friends; while on the other side the Carlist adherents do not conceal their rage and disappointment on finding this town placed beyond their reach.

Rumors have, during some days, been afloat of some skirmishes between the Carlists and the division of Espeleta, which left this town on last Friday; and although the rebels assert that that General was beaten, that he lost three thousand men, &c., the best informed state that nothing occurred except some trifling skirmishes. On the other side the Queen's friends speak of intelligence having arrived of a victory gained by General Alava on the 18th, over the Navarrese battalions in the neighborhood of Mendigorria, in which the latter lost in consequence of the repeated charges of the Queen's cavalry 800 killed and 200 wounded. The confirmation as well as the details of this action are much desired.

BAYONNE, Oct. 1.—No authentic intelligence has reached Bayonne from the seat of war in the northern provinces of Spain since the despatches from General De Lacy Evans and Colonel Wyke, on the 23d ult., from Bilbao.

The report of a battle also in the neighborhood of Orocco, on the 20th ultimo, 6 leagues from Bilbao, is not confirmed; indeed it is scarcely possible that anything of the sort could have taken place, the letters from Bilbao of the 22d ultimo, at so short a distance from the pretended scene of action, having made no mention whatever of it.

THE CONGRESS OF SOVEREIGNS.

TOPLITZ, Sept. 23.—The diplomatic corps has nearly completed its numbers; however the King of Prussia is not expected until the 26th, and the Emperor of Russia about the 28th of this month. The Kings of Bavaria and Wurtemberg, and the Grand Duke of Baden, who were on the list of Royal invitations, have sent apologies. It is also thought that the meeting of the Sovereigns will be of shorter duration than at first anticipated, but it is probable that our monarch will be able to persuade the other Sovereigns to accompany him for a few days to Prague. The crowd of strangers arriving here increases from day to day. The usual ceremony of inscribing their names on the visitor's list, is still adhered to, and even the crowned heads observe this regulation as well as private individuals. The Emperor and Empress of Austria were entered under the numbers 2642 and 2643. Several strangers have been under the necessity of seeking lodgings in the surrounding villages, as all the apartments in the town are as full as they can hold.

LONDON, Oct. 25.—In Paris on Saturday afternoon accounts had been received at Toplitz of a formal proposal having been made by Russia to her Austrian and Prussian allies, the objects of which were to produce a direct intervention in Spanish affairs, for the ostensible purpose of restoring the tranquility of the Peninsula; and secondly for such a definitive adjustment of the Bel-

gian question as would afford some protection to the interests of the King of Holland. It is to the decisive rejection of this double proposal that the extreme firmness of the money market in Paris, during the last week, is ascribed, some of the principal speculators having several days before, been in possession of correct information on the subject. Public confidence had been further confirmed by the proceedings of the councils-general in the French departments, which afford an accurate and satisfactory test of the general prosperity which prevails throughout the country.

GREECE.

A letter from Toulon, of the 26th ult., has the following: "The sloop *Cornelie* has arrived with important despatches from Admiral Massieu de Clerval, touching the present posture of affairs in Greece. At the departure of the *Cornelie*, several engagements had taken place between the insurgents of Romelia and the Bavarian troops sent in pursuit of them. The latter have already experienced several checks. The rallying cry of the insurgents is 'The Constitution for ever.' A letter from Salamis of the 7th, states, that 'the Bavarian troops and National Guards, sent against the Constitutionists, who have raised the standard of revolt in the western provinces, have been beaten. Intense agitation exists in every quarter, and great irritation prevails against Count d'Arma-berg. The people detest the Bavarians, who occupy every place; they ruin the country, and send our money to their native land—hence specie is very scarce."

Another letter from Salamis contains the following:—"Greece is in insurrection. Coletta has quitted on board the *Nelism*. He remained until the latest moment, in expectation of a revolution in Athens and the Pyraus. The government neglects to drain the marshes, and fevers prevail—six thousand persons are sick. The diplomatic body has been outwitted by the Austrian Ambassador, who has concluded a separate treaty with the Greek Government. The three powers, in return for the loan of the 60 millions, desired the establishment of a foreign tribunal for their respective subjects who might commit offences in Greece. A proposal to this effect was rejected, and the Austrian Ambassador, by not seconding the point, has insinuated himself into the good graces of the Greek Government. The annual expenses continue to exceed the revenue by six millions, and nothing is done."

A new and beautiful Steamboat called the *Shark*, has recently been built in this city for O. Mauran, Esq. She is upwards of 300 tons burthen, 160 feet in length, and finished and furnished in the most splendid style. She has been built under the superintendence of Cornelius Vanderbilt, Esq., and from the trials that have been made, she is believed to be one of the fastest boats ever built. We understand Mr. Mauran sails in her shortly for Havana, where he proposes to establish her as a regular packet between Havana and New Orleans, and if possible form a regular line from Charleston to Havana, which, with the present line to Charleston, would form one regular communication from this port to New Orleans. Such an undertaking deserves patronage, as it would be of great public utility and importance.—[Daily Adv.]

The Charleston Courier of Monday last relates the particulars of the breaking up a den of infamy in that city, kept by a man named June—where unfortunate women were forcibly retained, in order to allure seafaring men and others. These female victims of the most detestable and cold blooded speculation, were mostly brought on from this city—where the wife of the monster June, it is understood, now is, in search of a fresh supply.

The wretched women were taken away from the house, and put in charge of the civil magistrate.—Their names are as follow:

Jane Smith, aged 22, of New York; has a mother and sister in Columbia street, who are respectable.

Hannah Baker, aged 23, belongs to Philadelphia.

Henrietta Hutchins, aged 30, of Philadelphia; was once married to a Captain of a vessel.

Eliza Wilson, 17 years old last March, of Newburgh, New York.

Sally Sherwood, aged 26, of New York.

Elizabeth Buckley, of New York.

## TO TUNNEL CONTRACTORS.

Proposals will be received by mail, or otherwise, for excavating a Tunnel on the summit of the Sandy and Beaver Canal. The Tunnel is 600 yards long, the material to be removed is a soft sand-stone rock, the highest part of the ridge through which it passes is about 90 feet above the top of the Tunnel. As the deep cuts at the termination are not excavated, most of the material will have to be removed through shafts. Proposals must be accompanied with good recommendations, as to skill and competency.

E. H. GILL,  
Engineer.  
38-61

New-Lisbon, Ohio, Sept. 17, 1885.

## TO TUNNEL MINERS, DRILLERS, &amp;c.

Wanted, immediately, 40 Tunnel Miners, (Cornish Miners will be preferred,) 60 Drillers, 50 Laborers, and two experienced Mine Blacksmiths, on the New York and Harlem Railroad, about five miles from the City. Liberal wages will be given, and cash payments made every fortnight. Apply at Mr. FOWLER'S, St. John's Hall, Frankfort street, New-York.

JOHN RUTTER, Contractor.

The Albany Argus, Philadelphia U. S. Gazette and Pennsylvania, will please copy this, and send their bills to the Railroad Company, 14 Wall street, New-York. 23-47

## NEW-ORLEANS AND NASHVILLE RAILROAD.

## NOTICE TO CONTRACTORS.

The New-Orleans and Nashville Railroad Company having decided to place under contract the first fifty miles of the Road, on the 15th day of December next, Proposals will be received at their Office, in the City of New-Orleans, from the 15th of November to the 15th day of December next, for the Graduation and Bridging of the same. The Superintending Engineer, R. S. Smith, will be upon the ground to give every explanation relative to the manner of making Proposals, and such other information as may be required.

Of persons not personally known to the Engineer, there will be required certificates of character and qualifications. This part of the road, extending along the shore of Lake Pontchartrain, is perfectly healthy throughout, and being the commencement of the most extensive work in the world, it cannot fail to be of great importance to Contractors to identify themselves with the work at its commencement, as those who are known to the Company as responsible and efficient will certainly be preferred to strangers during the future progress of the road.

The country through which the line passes is generally high pine ridge, and perfectly healthy.

H. J. RANNEY,  
Chief Engineer N. O. & N. Railroad.  
Engineer Office, N. O. & N. Railroad,  
Aug. 25, 1885. 37

## RAILROAD IRON WORK.

Of all kinds, made to order by GODWIN, CLARK & CO., Paterson, New-Jersey.  
CAR WHEELS, BOXES, AXLES, and CAR SPRINGS, made and fitted complete, at short notice, and fair prices.  
Orders addressed to them at Paterson, N. J., or 34 Broad street, N. Y., will meet with immediate attention.  
Paterson, Aug. 19, 1885. 34-17

## AMES' CELEBRATED SHOVELS, SPADES, &amp;c.

300 dozens Ames' back-swing and plain Shovels,  
75 do do round-pointed do  
150 do do cast steel Shovels and Spades,  
100 do do Socket Shovels and Spades,  
150 do do steel plated Spades,  
Together with Pick Axes, Churn Drills, and Crow Bars, steel pointed, made from Salisbury refined iron. For sale by his Agents,

WITHERELL, AMES & CO.  
3 Liberty street, New-York.  
BAKUS, AMES & CO.  
8 State street, Albany.  
34-717

## RAILROAD IRON.

300 tons of Railroad Iron of the T pattern, just imported and for sale by  
HOWLAND & ASPINWALL,  
35 South street.

## RAILWAY IRON.

250 tons of 1 inch by 1 inch, Flat Bars in lengths of 12 to 18 feet, counter sunk holes, end cut at an angle of 45 degrees, with splicing plates and nails to suit.

250 dn. of Edge Rails of 30 lbs. per yard, with the requisite chairs, keys and pins.

Wrought Iron Rims of 36, 33, and 30 inches diameter for Wheels of Railway Cars, and of 60 inches diameter for Locomotive wheels.

Axles of 2 1/2, 2 3/4, 3, 3 1/4, and 3 1/2 inches diameter for Railway Cars and Locomotives of patent iron.

The above will be sold free of duty, to State Governments and Incorporated Governments, and the Drawback taken in part payment.

A. & G. BALSTON,  
9 South Front street, Philadelphia.  
Models and samples of all the different kinds of Rails, Chairs, Pins, Wedges, Spikes, and Splicing Plates, in use both in this country and Great Britain, will be exhibited to those disposed to examine them. 471mcawr

## PARTNER WANTED.

Wanted, a partner in an extensive Printing Establishment. No one need apply who is not a thorough printer, competent to superintend and direct an office in which upwards of 30 persons are employed, and able to furnish \$3000 cash capital. The best of references will be given and required. Letters, with real names, may be addressed to P. P. P., Post Office, New-York, postage paid, and they will be promptly attended to. May-6

## RAILROAD CASTINGS.

MANY A WARD, Proprietors of the Albany Eagle Air Furnace and Machine Shop, will make to order car wheels, chairs and knees, and every other description of castings required for railroads. R-17 Sublt

## STEPHENSON,

Builder of a superior style of Passenger Cars for Railroads.

No. 364 Elizabeth street, near Bleecker street, New-York.

RAILROAD COMPANIES would do well to examine these Cars; a specimen of which may be seen on that part of the New-York and Harlem Railroad now in operation. 34617

## RAILROAD CAR WHEELS AND BOXES AND OTHER RAILROAD CASTINGS.

Also, AXLES furnished and fitted to wheels complete at the Jefferson Cotton and Wool Machine Factory and Foundry, Paterson, N. J. All orders addressed to the subscribers at Paterson, or 60 Wall street, New-York, will be promptly attended to.

Also, CAR SPRINGS.

Also, Flange Tires turned complete.

## PATENT RAILROAD, SHIP AND BOAT SPIKES.

The Troy Iron and Nail Factory keeps constantly for sale a very extensive assortment of Wrought Spikes and Nails, from 1 to 18 inches, manufactured by the subscriber's Patent Machinery, which after five years successful operation and now almost universal use in the United States (as well as England, where the subscriber obtained a Patent,) are found superior to any ever offered in market.

Railroad Companies may be supplied with Spikes having countersink heads suitable to the holes in iron rails, to any amount and on short notice. Almost all the Railroads now in progress in the United States are furnished with Spikes made at the above named factory—for which purpose they are found invaluable, as their adhesion is more than double any common spikes made by the hammer.

All orders directed to the Agent, Troy, N. Y., will be punctually attended to.

Troy, N. Y. July, 1881. HENRY BURDEN, Agent.

Spikes are kept for sale, at factory prices, by L. & J. Townsend, Albany, and the principal Iron Merchants to Albany and Troy; J. I. Brower, 233 Water street, New-York; A. M. Jones, Philadelphia; T. Janviers, Baltimore; DeGrand & Smith, Boston.

Railroad Companies would do well to forward their orders as early as practicable, as the subscriber is desirous of extending the manufacturing so as to keep pace with the daily increasing demand for his Spikes. 133cam H. BURDEN.

## SURVEYING AND ENGINEERING INSTRUMENTS.

The subscriber manufactures all kinds of Instruments in his profession, warranted equal, if not superior, in principles of construction and workmanship to any imported or manufactured in the United States; several of which are entirely new, among which are an Improved Compass, with a Telescope attached, by which angles can be taken with or without the use of the needle, with perfect accuracy—also a Railroad Goniometer, with two Telescopes—and a Leveling instrument, with a Goniometer attached, particularly adapted to Railroad purposes.

WM. J. YOUNG.

Mathematical Instrument Maker,  
No. 9 Dock st., Philadelphia.

The following recommendations are respectfully submitted to Engineers, Surveyors, and others interested. Baltimore, 1884.

In reply to thy inquiries respecting the instruments manufactured by thee, now in use on the Baltimore and Ohio Railroad, I cheerfully furnish thee the following information. The whole number of levels now in possession of the department of construction of thy make is seven. The whole number of the "Improved Compass" is eight. These are all exclusive of the number in the service of the Engineer and Graduation Department.

Both Levels and Compasses are in good repair. They have in fact needed but little repairs, except from accidents to which all instruments of the kind are liable.

I have found that thy patterns for the levels and compasses have been preferred by my assistants generally, to any others in use, and the Improved Compass is superior to any other description of Goniometer that we have yet tried in laying the rails on this Road.

This instrument, more recently improved with a reversing telescope, in place of the vane sights, leaves the engineer scarcely any thing to desire in the formation or convenience of the Compass. It is indeed the most completely adapted to lateral angles of any simple and cheap instrument that I have yet seen, and I cannot but believe it will be preferred to all others now in use for laying of rails—and in fact, when known, I think it will be highly appreciated for common surveying.

Respectfully thy friend,

JAMES F. STABLEY, Sup't of Construction  
of Baltimore and Ohio Railroad.  
Philadelphia, February, 1885.

Having for the last two years made constant use of Mr. Young's "Patent Improved Compass," I can safely say I believe it to be much superior to any other instrument of the kind, now in use, and as such most cheerfully recommend it to Engineers and Surveyors.

E. R. GILL, Civil Engineer.

German town, February, 1885.

For a year past I have used instruments made by Mr. W. J. Young, of Philadelphia, in which he has combined the properties of a Theodolite with the common Level.

I consider these instruments admirably calculated for laying out Railroads, and can recommend them to the notice of Engineers as preferable to any others for that purpose.

## AMERICAN RAILROAD JOURNAL.

NEW-YORK, NOVEMBER 14, 1836.

**COMMENCEMENT OF THE NEW-YORK AND ERIE RAILROAD.**—We find in the New-York American of the 10th instant, the following announcement of the commencement of the construction of this important work. The Editor of the American says:—

"It is with feelings of the highest satisfaction that we announce the important intelligence, that the construction of this great work was commenced on the morning of the 7th November instant, by breaking ground at sunrise, at the western extremity of section No. 300, on the Delaware River, in the village of Deposit.

The members of the Executive Committee of the Board of Directors, consisting of Messrs. J. G. King, P. C. Stuyvesant, S. B. Ruggles, and W. R. Lawrence, under whose immediate charge this duty was performed, report—that on the preceding day, forty miles of the work were put under contract pursuant to previous notice—that the sections (44 in number) were taken by twenty-six different contractors, of approved standing and experience, many of whom will proceed to commence the work without delay—and all of whom are required to do so, on or before the 15th of next month.

There were more than seventy contractors on the ground, and several offers to take the whole route.

The graduation of this particular section is comparatively the most expensive of the whole line between the Hudson and the Lake,—but for that, among other reasons, it was selected by the Directors as the portion first to be undertaken, in order to subject to a severe test the correctness of the previous estimates. It has resulted in conclusive-

ly establishing the accuracy of Judge Wright, who, in his report to the Legislature, had estimated this division at \$9,500 per mile, and nevertheless, it has been now put under contract at prices *slight* of 8,500 dollars, and that too at a season when the prices of labor and provisions are unusually high.

The aggregate saving in this forty miles will be between fifty and seventy thousand dollars.

Encouraged by this very gratifying result, it is the intention of the Board to press forward the work with all practicable despatch, and if possible, to get ready another considerable section for contracts, before the 15th of next month. The last lingering doubts as to the practicability of completing this great undertaking at a very moderate expense, must now be removed, and we cannot but congratulate the public and the Stockholders, upon the flattering prospects thus opened to them."

This is, indeed, an important era in the history of New-York. It is another event, which, like that of the commencement of the Erie Canal in 1817, will give new life and energy to the business operations of the State. It will prove, and especially so to the Southern part of the State, a refreshing, and fertilizing shower, which will unquestionably enable thousands to reap golden harvests, where they have heretofore, with the most unremitting industry, obtained a bare subsistence. It will cause a line of flourishing villages, and eventually cities, to spring up—where now, or recently, the howling wolf roamed at large, committing his depredations upon the adventurous flocks of the hardy pioneer—and compete with those brought into existence by the Erie and other Canals. It will be to the South part of the State, what the Canals are to the North; and, like the CANAL, it will throw out its branches in every direction, which will afford to the neighboring villages the benefits of easy access; and to the stockholders a prospect of increased income. It will enable the farmers of Delaware, Broome, Tioga, and the counties west of them, to supply the market of this City with fresh provisions, at prices satisfactory, both to them, and to us; and what is of greater importance still,

to this City, it will open another ready avenue to the fertile valleys of the garden of the world; the produce of which, having become too enormous to find an outlet through the other channels prepared for it, will, on its thousand cars, come rolling down upon us like the mountain avalanche; producing of itself an increase of business on this Island, little anticipated, by the thousands who have looked on with apathy, or doubt, or of selfish jealousy, during its early history. It is, indeed, a proud era to those who have stood by it, with unflinching determination, through its darkest days; and they will yet, we trust, realize their most sanguine hopes and anticipations. To those who have doubted honestly, we say, go and doubt no more—and to those who have been selfish in their opposition, we say "go and sin no more"—against light, and the best interests of the State.

**CONVENTION, INTERNAL IMPROVEMENTS, &c.**—The delegation appointed by the citizens of New-York, to attend the Internal Improvement Convention, proceeded on Monday last to Utica, for the purpose of representing the interests of this Commercial Emporium. The gentlemen selected to discharge that important duty, are most of them, we believe, either now, or recently, active, persevering, and successful business men. They are intimately acquainted with, fully understand, and *duly appreciate*, the value and importance to the city of New-York, of those works, and Internal Improvements, so wisely commenced, and so successfully completed by the State—works, in truth, which have operated as a *leaven*, not only upon our own country, but also upon the whole civilized world; and have *given* an impulse to the spirit of improvement, which will produce results as much beyond the estimate and calculation of even the *present* most sanguine and active friends of the "good work," as we are now advanced beyond the *first settlement* of the American Continent.

To many, this may appear wild and visionary, and even madness; but if they will only reflect for a moment, and imagine the increasing velocity, and overwhelming power of a mighty river, supplied by the streams of a thousand hills drenched by the torrents of an equinoctial storm, not only of a week, but of *years* continuance, he will then have a faint idea of the growing impulse throughout the world, in favor of INTERNAL IMPROVEMENTS!!!

This, even, is not visionary. It is only an enlarged view of the subject—a subject, indeed, of more importance to *this*, than to any other country under the sun; and it should therefore be made as familiar to every citizen of the Union, and especially to the rising generation, as household words.

Is proof required for these opinions? Facts, innumerable, might be adduced to establish them, but we will mention one or two only—and first, the population of this city in 1810, was 96,373—in 1825, it was 166,086, giving an increase of 69,713 in *fifteen* years, *previous* to the completion of the various Canals, and commencement of the Railroads.

Now contrast this statement with the following, a result *mainly* to be attributed to the increased facilities for business, afforded by the Canals and Railroads.

In 1830 the population of the city was 207,021, and in 1835, by the census just completed, it is 269,872; showing an increase in *five* years of 62,851, which is *nearly* equal to the increase of fifteen years as shown above. Secondly, we will refer to the line of *almost cities*, from the Hudson to Lake Erie; the progress, and indeed origin, of which, in many instances, is mainly, if not wholly attributable to the Canals; as well as the unparalleled increase in the value of real estate in their vicinity—an increase, indeed, of more than ten times the cost of *all the Canals* in the State, *over and above what it would have been*, if they had not been built. Thirdly, the unparalleled increase of population, wealth, and prosperity, in the *great and fertile West*—a prosperity which, but for our Canals, would have been of the *next*, rather than of the *present* century.

Who, that takes a calm and dispassionate view of this whole subject, will not come to the same conclusions that we have, in relation to our own country? *All*, *all* will do it sooner or later.

As to the operation of the same spirit in Europe, as well as in this country, the evidences are increasing daily; and while writing this article, we find in the *Mercantile Advertiser*, an extract from a letter which confirms it as to Germany; and in another column, will be found similar evidence as to other parts of the continent. Of Great Britain, we need hardly speak, save in a spirit of commendation, of the immense and numerous works going on, and in con-

templation. They are the best evidences of liberal forecast, and public spirit, of the English people.

The letter referred to is as follows, and alludes, if we are not in error, to our worthy citizen, JAMES H. BELL, Esq., now the Chief Engineer of the Mad River Railroad in Ohio.

Extract of a letter, from a gentleman in Leipsic, to his friend in this city, dated Sept. 21st, 1835.

"It is with sincere regret, I see from a letter I have just received from M—, that we have no chance of seeing the hopes I expressed to you in my last letter, written in May, realized, viz: to see J. B. the leading Engineer of our Railroad from Leipsic to Dresden. I am the more disappointed, because I think there will be very brilliant prospects for an intelligent and experienced engineer in this country. The whole north of Germany has been seized with a Railroad fever since we set them an example, and I think the time is not far distant, when this whole country will be covered with a perfect net of Railroads."

If, then, our predictions are eventually to be realized, how important it is, that the CONVENTION at Utica, now in session, should view the subject in a proper light; and discard all local or sectional feeling; and show themselves the representatives of a mighty State, whose interest they have at heart.

Their deliberations should be how to benefit the greatest number, in the shortest period, at the least outlay of capital; how they can most effectually promote those works which, at the same time that they advance the interest and convenience of our own citizens, also induce the citizens of other States, and especially of the West and South, to make us their carriers, commission merchants, shippers, and bankers.

It is now an established fact, that no considerable work of improvement can be completed in any part of the Union, which will not in some degree benefit New-York; yet it is important that our own works should be so constructed as to meet, if possible, and correspond with those made in other States; and highly important that we should open avenues which will compete successfully with any of our rival neighbors.

NORWICH AND WORCESTER RAILROAD—BREAKING GROUND, &c.—We have received a very polite invitation from the President of this Company, to attend the ceremony of breaking ground, which is to take place on the 18th instant. We need hardly say, that we should be highly gratified to accept of the invitation; and to participate in the pleasure, which the ceremony will undoubtedly afford to those who have, with so much perseverance, pursued this noble object, which will now, beyond all question, be speedily accomplished.

Judging from the Report of the Committee, which, with the Act of Incorporation—and a most liberal one it is too—has been received—this Road, connected, as it

will be, with the *Boston and Worcester Railroad*, and passing through the most populous, wealthy, and enterprising part of Connecticut, will most assuredly become an exceedingly valuable investment. It is truly surprising to learn the amount of business which is now done on the line of this Road; but more so to reflect what it will be when this Road shall have been a few years in successful operation.

Its whole route is along the water courses, and its greatest inclination is under 35 feet per mile, and its average under 12 feet, with an abundance of materials along its route for its construction.

Thus it is that the whole country is becoming checkerboarded with Railroads. Boston has its Providence, its Lowell, and its Worcester Railroads; and Worcester, in its turn, becomes a point of radiation, and will soon have its Norwich, its Springfield, and, at no distant day, its *Albany* Railroads; whilst each of these will give rise to others of less extent, but not of less utility, to the flourishing villages, and rapidly improving country, to be benefitted by them.

It appears, by the report, that the first charter was for a Canal; but on discovering the superiority of Railroads—and it would be very singular if the people of Connecticut did not make that discovery—the Canal project was abandoned, and a Railroad substituted. By this change the immense water power is preserved, and the facilities for travel and transportation greatly increased; whilst with a Canal, much of the former would be destroyed, and of the latter, transportation only would be benefitted.

There are instances, undoubtedly, where Canals are preferable; but since the American people have become so much of a locomotive race, and so impatient of control and delay, it has become highly essential that the works of Internal Improvement should at once combine the advantages of speed, and capacity for transportation—at low rates.

Of the certain, and immense reduction of expense of transportation on Railroads, we do not entertain a doubt. Experience, in other modes of transportation, will bear us out in saying that such improvements will yet, and soon, be made in the construction of Railroads, and its machinery, as, in fifteen years, to reduce the cost of transportation more than one half.

It would, indeed, be singular if the first projectors and makers of Railroads, were to jump at once to a state of perfection in the art; whilst the developments of the advantages, and the improvement in Canals, have been going on for ages; and in arriving at the present condition of steamboats, the united and devoted efforts of many of the ablest men in the world have been engaged for more than a quarter of a century.

The field, for improvement in, in our opinion, far greater in Railroads, and its

machinery, than in steamboats; and yet we see a reduction in the price of transportation of passengers in the latter, reduced, in a few years, from \$10 to \$3—\$6 \$4—\$3 \$2, and even to \$1, from New-York to Albany. At the last named price, very little profit can be made; but at \$2—or one fifth of the first prices, and in less too than 30 years, from the first introduction of steamboats on the Hudson—fortunes could be made in carrying passengers to Albany.

If, then, such reductions have been made in steamboats, why may we not also anticipate corresponding improvements, and reductions in the prices of transportation on Railroads?

The following extract and summary of the report will give a very good idea of the route, the road, and its prospects.

The wonderful improvements of a few years past, justify us in anticipating that in a very short space of time, there will be one continued line of Railroad from Maine to New-Orleans, and the physical structure of the country seems to point out the vallies of those streams leading to Norwich, as the true route for this link of the great chain of communication.

From what has been stated it appears—

1. That the route of the Norwich and Worcester Railroad is a direct route to Worcester, by the vallies of rivers—with a country in every respect favorable, with an elevation to be overcome in no point more than thirty feet per mile, and the average elevation of 11 77-100 feet per mile—and that the materials of construction are at hand, and the expense would be unusually small.

2. That within five miles of the route there are seventy-five cotton manufactories, twenty-seven woollen mills, about one hundred stores, and numerous mills for the manufacture of iron, paper, &c.—that the number of cotton spindles employed in the two counties in Connecticut through which this Railroad passes, is officially ascertained to be 106,220, being more than three quarters of the entire cotton manufactories of the State, and that there is probably nearly an equal amount in the county of Worcester, and that there is not, in any part of this country, a region so abounding in manufactures as on the borders of this route.

3. That the present amount of transportation to market from towns very near and on the borders of this route, is at least equal to 30,000 tons annually transported through the entire route, and would be greatly increased by transportation from towns on the borders of the Boston and Worcester Railroad, from Boston and from the country north of Worcester.

4. That there is unoccupied water-power, on and near the borders of this route, ascertained by survey to be not less than sufficient to carry 1,000,000 spindles.

5. That there are in various places, on and near the route, valuable stone quarries for building, and in the town of Killingly inexhaustible quarries of flagging stone, pronounced by Professor Mather superior to any now in use in this country.

6. That the Railroad from Norwich to Worcester, and from Worcester to Boston, pass through the most populous part of this country, and that the counties through which these Railroads will pass, exclusive of the county embraced by Boston, contained in 1850 a population of 275,000, and that

there is a population north of Worcester, and of the Railroad from Boston to Worcester, which would find this the most direct route to New-York, not less than 250,000, exclusive of Boston.

7. That the route by Railroad from Boston to Worcester and Norwich, and thence by steamboat to New-York, is 100 miles by Railroad, and 130 by steamboat; and when completed, the passage may be made in 16 hours, and is the best existing route between Boston and New-York, being the easiest, cheapest, most direct, and rapid.

8. That the route from Boston to Norwich may be readily reduced to 88 miles—that Norwich is within three miles as near New-York as Stonington—and the route from Boston by way of Norwich to New-York would be as near as by way of Stonington.

9. If a Railroad is constructed on Long Island, the distance from Norwich to its termination is 28 miles, and from Stonington 25 miles, enabling the Norwich and Worcester Railroad to avail themselves equally well of the Long Island Railroad.

10. That a Railroad constructed on the borders of Long Island Sound, would accommodate the long travel, and would receive an immense amount of local travel—it being estimated that the number of passengers annually passing in the steamboats and the towns on the border of the Sound is not less than three hundred thousand, and that the distance from Norwich to New-York is 130 miles, and from Stonington to New-York, including two ferries, is 122 miles.

11. That by the extension of the Railroad communication to Lowell, and thence farther north and east, every part of the chain is benefitted, and this part greatly improved.

12. That the extension of the Boston and Worcester Railroad to Springfield, and thence to Albany, by opening the valley of the Connecticut, and affording a Railroad communication with the interior of New-York and the West, will add to the revenue of this Railroad.

HUDSON AND DELAWARE RAILROAD, OF the Effects of Internal Improvements.—The following exceedingly well written—and nothing more just and true—communication is from the Newburgh Gazette, of 31st ult.

It refers to a circumstance, in relation to which the Editor of this Journal had, in the fall of 1830, an argument with a worthy citizen of Newburgh, who contended that “the attempt to introduce Towboats, in the place of sloops, to do the *freighting* business of that flourishing village, would prove a failure.” He insisted that *steam*, and *tow-boats* could never compete with sloops for *freight*; whilst it was contended by us that they would *eventually* supersede sloops for most kinds of freight, as much as they had then superseded them for passengers. Were we not correct? Let the citizens of Newburgh answer.

It is not necessary that we should exult in the so speedy fulfilment of our prediction; nor that we should express our satisfaction at the highly flattering prospect which greets us, of the *certain* completion of the Hudson and Delaware Railroad.

This Railroad was one of the very first

which came under our observation, when we commenced the Journal; and although, in the multiplicity of business, *aside* from that of the Journal, we may have seemed to loose sight of it, we have never doubted its importance to Newburgh, and shall hereafter take much pleasure in contributing our mite in this, our *only* possible mode, towards its completion.

The annexed is a list of the officers of the Company, which is composed of gentlemen who will make the Road—of gentlemen who will not permit it to be *Canajoharie-ized*—if we may be allowed the expression.

It is but just five years since our enterprising neighbor, CHRISTOPHER REEVE, first applied Steam to the transportation of produce and merchandize between this village and New-York. It was then regarded as a hazardous experiment, and one that must certainly fail, and bring ruin upon its projector. Such was the universal opinion at that time, and men could not see how a person of Mr. Reeve's sagacity, and experience in business, could embark in a scheme so wild and visionary. If any one had foretold that in five years we should have *five Steamboats* of the first class engaged, and successfully engaged, in the business of transportation, actually bearing away the palm of speed and superiority from the best boats on the river, he would have been deemed a madman at least, and the wise men of the day would have sighed over the folly as well as the frailty of poor human nature. Yet we actually see these predictions realized, and more than realized, every hour that we live; and we venture to assert that there are none now so bold as to foretell with any thing like certainty or truth what the next five years will bring forth in the way of improvement, should the country happily continue to be exempt from those calamities which baffle human foresight, and arrest the progress of human exertion.

The truth is, there are none of us who can properly appreciate the advantages of our position—the advantages of a free country, acting under the influence and impulse of a popular government, where individual enterprise and exertion are left to the free enjoyment of a fair field, and the unlimited scope of its own native energy. We are to apt too compare our country with others—to liken the liberal and enlightened age in which we live, with the semi-barbarous and gloomy eras that have gone before us, and to measure our advancement in the useful arts, and the work of public improvement, with the slow and sluggish progress of those nations who never have enjoyed our peculiar advantages. In countries where wealth is unequally distributed, and where aristocratic laws and institutions of government operate to make the rich man richer and the poor man poorer, the acquisition of wealth and the accumulation of capital is slow, compared with what it must be in a country where wealth is continually changing, and its distribution measurably equal, and where the laws and constitutions of government place men upon a footing of equality, and where there is no superiority, but that which springs from superior talents and industry. With us surplus capital is applied to the purposes of internal improvement and other objects of public and universal usefulness; while in the monarchies and

despotisms of the Old World it is wasted in desolating wars, in the destruction of human life, and the prostration of human industry, in the construction of works of defence, and the erection of monuments of art, which minister to the pride and pamper the vanity of the few, without meliorating, in the slightest degree, the condition of the many. We have no privileged classes who claim an exemption from the public burdens. We have no pensioned, pampered idlers, who live upon the labors and industry of their fellows. We have no wars, and but few works of public defence. We maintain, comparatively speaking, no army, and, for our extensive commercial marine, a limited navy. We have no public debt, and pay neither taxes nor tythes, but we are living in the enjoyment of equal laws, equal rights, and under institutions of our own creation. We have the cheapest government now existing, or that ever did exist. Our population are all producers, actively and eagerly engaged in the acquisition of property, and contributing by their exertions to enlarge the volume of wealth and capital.

It is this immense increase of capital, uniting with that which flows in upon us from foreign countries, that is constructing our Railroads and opening our Canals, building our cities and villages, and operating to advance the price of real estate of every description; and unless our prospects and prosperity are marred by some unforeseen and untoward accident, new works of internal improvement will be projected and executed, new cities and villages will be called into existence, and real estate increase in value far beyond its present prices.

Unless our surplus wealth can find employment in the purchase of lands, in the construction of public works, in new fields of commercial adventure, and in the various branches of manufactures and the mechanic arts, we are at a loss to know what is to become of it. Men will not bury their money in the holes and caverns of the earth, or hide it in the depths of the deep sea. While the country was oppressed with a heavy public debt, and individuals were borne down with similar embarrassments, it was more easy to lend than to borrow money. But the times are strangely out of joint in this particular, and those that have money to loan are sadly perplexed to find borrowers. The national debt has been extinguished, and the State is offering eight or nine per cent. for the privilege of paying off its Canal loans. Bonds and mortgages have been erased from the public records by thousands, and it is far more common to find men searching for the debt to apply the means, than the means to pay the debt. The reign of the Sharks and Shylocks seems fast hastening to its close, and men of moderate means may now venture into the money market, and not become a prey to the spoiler.

Such are some of our reasons for the opinion that real estate in this vicinity has not by any means reached its maximum value; and these reflections will also exhibit in part the basis of our faith when we express our sincere belief that the Hudson and Delaware Railroad will be completed and put in operation in far less time than that limited by the act of incorporation. We confess we are exceedingly gratified at the manner in which the Company has been organized, and we regard it as an especial subject of congratulation that the stock has fallen into the hands of our own citizens, and its management confided to

the individuals who compose the present Board of Directors. Had the stock been taken by the jobbers and speculators, men who would have used the scrip as black-legs use the cards, to cheat and deceive the unwary, regardless of the ends and objects of the charter, or had it fallen into the possession of mere strangers, men who had no concern with our interests, and had no hearts for our prosperity, with the case of the Canajoharie and Catskill Road fresh in our recollection, we certainly should have had some fears for the result. But now that the capital is within our own control, and with ample means of our own to carry the project forward to its final completion, we consider the construction of the Road an event which no longer admits of a doubt. The question hereafter will not be whether the Road will be made, but where it will be located, and what is the shortest time possible in which it can be put under contract and completed. The interest taken in the successful issue of the project is not confined to the citizens of our own immediate vicinity. It was not amongst the least gratifying circumstance which occurred at the election for Directors to witness the presence of numerous and respectable delegations from Walden, Washingtonville, Montgomery, Phillipsburgh and Middletown, tendering their hearty aid and co-operation should the line of the Road fall anywhere near those flourishing villages.

We think also that the selection of the present Board of Directors is another earnest of the speedy construction of the work. It was well remarked in our hearing the other day, that the Board combines within itself more sterling talent—more real substantial wealth, persevering energy, and untiring industry, than any similar body of men selected for a similar purpose within the county of Orange. We all know that the gentlemen are largely interested in the stock, and that they have within themselves ample means to make every foot of the Road without interfering with or interrupting any of their other pursuits. Their high character for honor and probity is unquestioned, and their enterprising spirit, and successful industry, is exhibited and made manifest in the numerous works of substantial improvement commenced and consummated in our vicinity within the last five years. Amongst the Directors will be found the projectors and early advocates of the Road when its success was doubtful—who have clung to the project and cherished the hope of its ultimate accomplishment, through every change of good and evil fortune. It is an effort in every way worthy of their genius and enterprise, and the liberal and enlightened age in which we live.

At a meeting of the Directors of the Hudson and Delaware Railroad Company, held at the Orange Hotel on Saturday evening, 24th inst., the following officers were chosen, viz:

THOMAS POWEEL, President; J. W. KNEVELS, Vice President; JOHN LEDYARD, Treasurer; JAMES G. CLINTON, Secretary; D. W. BATE, Esq., Attorney and Counsellor.

The Directors have taken measures to secure the immediate services of a distinguished engineer, for the location of the route.

**RAILROADS.**—The Boston Daily Advertiser says—We remarked a few days since upon the changes about to be produced, by the introduction of Railroads, on the growth and prosperity of commercial cities. The channels of communication, instead of depending as heretofore upon the course of rivers which intersect the various commer-

cial countries, will be determined and established, by the enterprise of those cities which have the foresight to seize first upon the routes which the face of the soil admits of being established. We alluded in those remarks more particularly to the improvements, of this description, likely to be introduced in this country. The same questions present themselves with equal force in Europe. A French Journal, just received, contains the following information, under date of Frankfort on the Maine.

"If our information is correct, great and powerful rivalships are about to take place in the sphere of internal improvements. Several companies encouraged and assisted by Bavaria and its bankers, have formed the project of making a Railroad from Bamberg to Leipsic, so as to unite the Elbe with the Danube, by means of the canal of Bavaria, thereby giving to Hamburg the supply of colonial goods to all Germany. Another company, among the members of which figure several great houses of Strasburgh and Metz, have a project of establishing a Railroad from Strasburgh and Metz to Sarrebruck, for the conveyance of coal, provided the Bavarian government will undertake to continue the Road, in connexion with the neighboring states from Sarrebruck to Mayence, so as to unite Metz and Strasburgh with the canal of Maine and Central Germany, thus excluding from the commercial movement of Germany, all the Lower Rhine, Belgium and Holland on one side, and Baden and Wurtemberg on the other. However active the undertakers of this project may be, a serious opposition is already prepared. It consists of an undertaking to establish the Canal of the Black Forest, which will have for its object to unite the North Sea with the Rhine at Kehl, with the Mediterranean by the Canal of Monsieur, and with Lake Constance and Upper Italy by a Canal which the Company of the Canal of the Black Forest are about to undertake. The funds of this last Company are secured by several houses of Amsterdam, Brussels and Cologne. Such are the facts, and such the projects which agitate the world of industry. We undertake only to be its historian, leaving it for the future to decide which of these great rival enterprises will obtain the victory."

We transcribe this passage from a foreign journal, for the purpose of showing that the same sort of rivalry in this species of improvement has sprung up in Europe, which exists in this country. The works above mentioned are but a part of the projects which we see from time to time mentioned in the European papers. In regard to the class of improvements which will obtain the victory, we have no hesitation in believing that in most cases Railroads will decidedly take the precedence over Canals, and chiefly for two reasons, one, that Railroads have a wider range in the choice of their route, not being confined to channels in which a large body of water can be made to flow, and the other, which is the most decisive, that besides being a channel for commerce, it is at the same time a channel for the conveyance of persons, and in a manner so far superior to every other mode of conveyance, as to give it the monopoly of travelling, and in consequence, to afford it the richest source of income.

Railroads, it is true, as hitherto conducted, have not been able to transport goods at so low a rate of expense as canals. This, however, is to be attributed chiefly to the fact, that an economical mode of transportation has never yet been adopted on the great public Railroads. The reason is,

that the transport of passengers on all these Railroads has been the leading object, and the conveyance of merchandize a subordinate one. A different system may undoubtedly, and will be introduced, by which merchandize shall be conveyed at a comparatively slow rate, with engines of a different construction, of less speed and greater power, to travel in the night only, leaving the Road free for passengers in the day time. Travelling by night on Railroads is unsafe only because it is rapid. If engines be so constructed as to reduce their speed, and increase in the same proportion the weight of the load which they are capable of moving, they may travel by night with perfect safety, and may convey those loads with as little cost, as loads of the same magnitude on Canals. Such we believe will be the result of future experience. Railroads will therefore possess the double advantage of rapidity of conveyance when quickness of movement is desired, and of cheapness whenever a saving of time is unimportant. It will consequently possess the advantage of deriving an income from both these sources, and of combining at the same places the facilities of business resulting from both, and will therefore in a great measure supersede an improvement which possesses but one, and that the least important of these advantages.

The preceding remarks from the Boston Daily Advertiser, are worthy of being republished in every newspaper in the Union. The writer judges the future by the past—and he is correct in saying, or rather in *showing*, that great and important improvements are yet to be, and certainly *will* be, made in the use of Railroads.

They are yet altogether in their infancy—not more advanced in their progression than Canals were a century ago. They will, however, advance more rapidly than Canals have done; and in *twenty* years, the transportation on them of *most* articles will be *more rapid, more sure, more safe, and less expensive*, than on Canals—and what is of vast importance to this country, they will traverse it in *all* directions, bringing every part of the country comparatively near market—and easy of access.

According to the Baltimore Patriot, the tolls on the Pennsylvania Canals and Railroads, for the year ending on the 31st ult., amount to about 690,000 dollars—nearly double the receipts of the preceding year.

Thus it is that the works of Pennsylvania are becoming more and more productive.

To the Editor of the Railroad Journal:

SIR—My attention was forcibly drawn to the remarks of your correspondent, in the January number of the Journal, on the subject of Suspension Bridges, and more especially with his liberal and magnificent design of erecting such a structure at the Fulton Ferry. The views of that gentleman are worthy of the enlightened state of the arts, and in keeping with the advancements of the age; and although the measure he proposes has elicited no public attention, that I at this distance am aware of, it has doubtless made a permanent impression upon the minds of those within whose peculiar province it falls.

It is not my intention to say any thing in addition to the subject of his communica-

tion; but as it is connected, in my mind, with the design of this paper, a recurrence to it serves as a suitable introduction to a notice of a Bridge upon a new plan, which the inventor is about to patent, and which, to my view, seems to possess a peculiar adaptation to the site of the Fulton Ferry, whilst its general application would not be less profitable in minor constructions.

A Bridge of the form that I am about to speak of, may be termed (without impropriety, I suppose,) a Suspension Bridge; but the important point on which I differ from those at present known, consists in the employment of continuous bars of wrought iron, instead of chains made up of links; thus (*ceteris paribus*, diminishing the weight of the metal one half, and probably in the proportion of two to five, and also enabling the architect to extend his bars much more tensely than can be done with chains in the present mode of erection. Indeed, in a span of one hundred or one hundred and fifty feet, the tension can be given so as to present but a slight departure from a straight line, and the curvature will be nothing more than that which results from the elasticity of the metallic bars themselves.

It is proposed to secure these bars, at their extremities, and to pass them over abutments (and piers where they may be required by the breadth of the stream,) in a manner no wise different from the usual chain-fastenings; but as they will assume but a very slight curve from *sagging*, compared with the catenarian curve, which gives a corresponding obstruction to the waterway, unless the suspension towers have considerable elevation, these abutments will be required to be raised but to a moderate height above the surface of the stream, thus reducing to a great extent the cost of a bridge in all situations, and demonstrating the practicability of its erection on sites where otherwise the expense would not admit of them for many years to come, and in some, most probably, never.

Moreover, a Bridge of this construction may be provided with a draw, upon a plan, which I believe, is equally novel and ingenious. This is to elevate the two piers, inclosing the draw, to a height sufficient to pass the tallest vessel that may apply, and over these to extend a second series of the continuous bars, terminating in braces, which may be securely fastened in various ways at the ends. The moveable floor is suspended from these by pendulous rods, whose upper extremities are attached to the axles of two or more flanged or grooved wheels, plying upon the upper series of bars in such manner that when the draw is closed, the wheels repose in the midway of the opening, and as it is opened, recede *pari passu*, with the floor towards the pier. If a Bridge on this plan were built at a point of great thoroughfare, an accessory pathway for foot passengers might be made by a stairway over the summits of the piers, while the opening of the draw would only obstruct the passage of vehicles.

In addition to economy of construction, the inventor thinks it is an important feature, that if any parts need renewal, they may be removed without impairing the strength, and replaced by others, and thus the whole structure be consecutively renewed, like the gradual absorption and deposition of the particles of the living frame.

It was not my purpose to say more (nor indeed so much) of the form of this Bridge at present. That objections may be suggested against it, I have no doubt, but I think they are all susceptible of removal or obviation, and none can apply that do not

attach with much greater force to Chain Bridges, whose utility and adaptability to the most critical and difficult situations are not now matters of question. My object was to call to it the attention of those of your readers who are more qualified by their habits and experience to judge of its claims, and perhaps to draw forth their opinions.

S. M.

Baltimore, March 12th, 1835.

Accompanying this communication we received drawings of two forms of this Bridge, both intended for draws, and one in illustration of the stairway, for foot passengers. They were not intended for publication, yet they are at the service of any gentleman who may desire to examine them. The plan certainly has novelty, if no other merit for its recommendation—and we ask for it an attentive perusal.

QUERIES TO ENGINEERS.—We have been requested to submit the following queries to the consideration of Engineers, and to request replies to them through the Journal.

1st, What rate of ascent per mile is preferable for the use of locomotive steam power, to that of stationary, upon a straight line of Railroad, the distance the same in both cases, the cost for construction the same in both cases, the freight, passengers, and as many as can be transported upon a good permanent double tract, upon a level Road?

2d, What rate of ascent per mile is preferable for the use of locomotive steam power, upon a curved line, say 1000 feet radius, to that of stationary power, by making the curves between the planes of a smaller radius, say 500 feet, and the planes for stationary power on straight line, distance, cost, and transportation, as before mentioned?

3d, What rate of ascent per mile is preferable for the use of locomotive steam power, to that of stationary, as in the 1st and 2d question, provided the transportation is only half the Road is capable of doing?

4th, What rate of ascent per mile is preferable for the use of locomotive steam power, to that of stationary, as in the 1st, 2d, and 3d questions, with the exception of passengers, as freight and transporting produce and merchandize?

5th, What extra distance is equal, by going around an elevation and depression, to that of going over at the rate of 60 feet per mile, for a distance of 2 miles, 1 mile each way from the summit, the level the same on both sides of the ridge, the curves the same in both cases, the cost for construction the same in aggregate, transportation to be passengers, as in the 1st question?

6th, We will fix the rate of ascent for locomotive power, at 60 feet per mile for this question, and say, we have 10 miles to ascend at the same rate, for the transportation of passengers, as in the 1st and 2d question, cost for grading is \$10,000 per mile—\$100,000, and further say that a location can be made near the one proposed, by rising 40 feet per mile, for the last 5 miles, and the remaining 5 miles will ascend at the rate of 80 feet per mile, this location will cost less money than the 1st, how much less should it cost to make it equal to the 1st, distance the same in both cases?

I have asked the above, questioned in that simple, plain, and pointed way, in order to prevent the gentlemen avoiding the answers of some kind.

## HASKINS' PLAN FOR CONSTRUCTING RAILROADS.

The following plan for constructing Railroads, is submitted for the consideration of our readers. It will be found useful, in many parts of the country, for passing soft or marshy ground, and perhaps for the construction of cheap roads. We are truly obliged to Mr. Haskins, as we are to every gentleman, who favors us with his views on the subject of Railroads.

Mr. Minox,—I subjoin, for your publication, a plan for constructing Railroads, which, so far as I know, has not been advanced by others, and which may be found useful. I made a suggestion, some four years since, embracing the principle, in an article upon the Mad River Railroad, which appeared in one of our public journals. In April last, I drew out a plan and specifications, and submitted them to the Directors of the Aurora and Buffalo Railroad Company; since which, some copies thereof have been obtained for Engineers upon other works for examination.

Durability, and the maintenance of fixed levels, are matters of the first importance, in Railroads. I believe Engineers do not estimate the durability of these works, when constructed upon any one of the most approved plans at present in use, at over ten or twelve years; that is, without expenditures which almost equal the cost of rebuilding upon the same grade. If this is so, I believe the subjoined plan for constructing will prove valuable; for, while its cost will be found (where suitable timber is plenty) intermediate between the most and the least expensive Roads that have been made, it will produce a Road which, without any material repairs, will maintain its level, and remain good from sixty to eighty, and in some cases even one hundred years. I know full well that driving piles is nothing new in Railroad construction. Over marshy grounds these Roads have always been carried on piles, but on dry ground, the expense would be too great to drive as many piles as would be needed for all the roots. The proposed plan is designed to secure a fixed level for very long periods of time, without undue expense. The grading will be the same in this as in other cases.

s, and

to be adjusted to the same level as the piles, the earth being driven in tight around them. Their length I have assumed at three feet. When at hand, a flat stone might be laid beneath each block, with advantage. These blocks, by the use of the Road, will, in time, settle more or less; but, as each end of the stretchers remains fixed upon the piles, these central depressions may, at any time, be elevated to a horizontal line, by wedges driven under the stretchers, upon the heads of the blocks—a process alike cheap and effectual.

The length of the stretchers, and the distance between the supports, or blocks, will be matters of consideration. The former I have assumed at twenty feet, and the latter four feet. Probably, as the stretchers will rest upon the soil, the distances between the supports may, in many Roads, be considerably greater than this. The stretchers should be tied, at suitable distances; though few ties will be necessary, if the stretchers be firmly bolted to the heads of the piles. These ties, when a horse-path is intended, should be cut away in the centre, so that the gravel of the path will form a smoother surface above them.

The piles, blocks, stretchers, and ties, which constitute the whole work, except the iron rail—if of beech, cedar, or locust, and cut in winter, will exceed in durability, the extreme of human life.

R. W. HASKINS.

Buffalo Sept. 4, 1835.

To the Editor of the Railroad Journal:

Mr. Minox, Sir,—In your Railroad Journal there has been much said on the subject of the tenacity or cohesion of iron, but in regard to the particular shape or form for Rails, (for wear and economy,) I am not aware that the subject has been much dwelt upon. From my observations of the different Railroads that I have seen, I am convinced that there is an immense difference in the economy and wear of the different kinds of Rails, and have no doubt that it is owing to the different shapes that the iron is wrought into, more than to the quality of iron used in their manufacture.

I have observed a great difference in regard to the splitting and scaling of Rails, by compression, (from use)—it appears to me that the flat or plain Rails can, and would be wrought more compact, and in wear there would be at least 50 per cent. in their favor.

From conversations with many of the Directors of Railroads, I have not found that the subject has been much thought of. The safety in travelling on Railroads depends much on the solidity or compactness of the iron. The Rails that split or scale the most, must of course be more dangerous; the next consideration is economy in their results, for long use, and not for the mere consideration of their first cost only.

Will some of your numerous correspondents take the subject into consideration?

Yours obediently,

P. FARRING.

—We cannot reply to the above questions for want of experience, and therefore call upon those of our practical and experienced friends to answer them for us, through the Journal.

—It is important that this subject should receive attention, and we are ready to do our part, publish it, when we receive the answer.

The contemplated Railroad from Winchester, up the great Virginia Valley, to Staunton, merits the decided countenance and support of this community, and we are happy to find that there is a daily growing interest on its behalf among us. The construction of this work, it seems to be admitted both by its friends and enemies, will settle the question of the course which the trade of western and southwestern Virginia will take, in favor of Baltimore. The valley route to market is conceded on all hands to be the natural one, and with the facilities offered by a continuous Railroad from Staunton to Baltimore, the current of trade would set so strongly to this market, that no inducement which rival works could offer, could divert it from this channel. Once extended to Staunton, the line will never stop in its progress until in the first place it intersects the Railroad which is to unite the James and Kanawha improvements, and until it finally passes through Tennessee to a junction with the Nashville and New-Orleans Railroad.

[From the New-York American.]

We understand that considerable progress has been made, during the past season, in the works for the improvement of the navigation of the Hudson river. The whole amount of the first appropriation (\$70,000) will have been expended by, or before, the close of the season; in addition to which the Corporation of Albany have advanced \$10,000, to be applied, if deemed necessary by the Superintending Engineer, towards completing and securing those portions of the plan now in process of execution. The existing plan is the one recommended by a Special Board of Engineers, convened in 1834, subsequently modified, in a slight degree, at the suggestion of the Superintending Engineer, Captain Andrew Talcott. It proposes to remedy the present defects in the navigation of the Hudson, by contracting the main, and closing the lateral channels, and by protecting the shores, or those portions of them which may be endangered by the action of the current, by a covering of small rough stones. By the first operation, the waters are confined within narrower bounds, and to their consequent increased velocity, especially during the Spring freshets, the Engineers chiefly look for the removal of the existing bars and shoals. Dredging machines are likewise to be employed to effect this object; and the sand and gravel, thus removed from the bed of the river, are the materials used in the construction of the dykes, by means of which the channel is to be contracted. The covering of stone on the channel shores is intended to protect them from the abrasion of the waters, and thus, in so far as that measure is available, to prevent future deposits. There seems to be no reason to doubt the excellence of the plan in theory, or its eventual success in practice. In the latter event, Albany will possess a free navigation to the ocean for all vessels of or under 10, or, perhaps, 12 feet draught.

HOPKINS' CAST AND WROUGHT IRON DRAW BRIDGE.

Chamblay, Oct. 24th. 1835.

D. K. Nison, Esq.

Dear Sir,—I am anxious to try steam-boats on the Canal that is at the point of completion here. I have a schooner which is well calculated to receive an engine of ten or twelve horse power, and would put one in her if I could get it cheap. Will you please to advertise in such a way, for a small engine, that I need not be obliged to take it, if beyond my means of payment. I should like a second hand one, and if high pressure, I should not object. Will you let me know the answer to your advertisement, and if an engine is offered cheap, I will come on and see it.

I have just been making a cast and wrought iron draw bridge, of 35 feet span, of which I send you a sketch; it cost \$1500, stone work and all.

From A to B is 36 feet, the versed sine of the arch is 2 feet, and the depth of the rib from C to E is 2 feet. The bridge is composed of 8 ribs, like the one A C H E, braced together, and plankd over the top. The upper bar A C B, and the posts e f, e f, are composed of iron cylinders (cast), through which wrought iron rods are passed; the cylinders are 2½ inches in diameter, and the rods passing through them are 1½ inches; the rods passing through the post cylinders have eye bolt heads, and the rod that threads the upper cylinders passes also through these eyes; the post rods pass through the lower bar D E G, which is of wrought iron, 1 inch by 8 inches; the braces should be hollow cylinders, whose exterior diameter is 1½ in., and which are ½ in. thick; but it was found difficult to cast them here, and they were cast feathered. At G and D are cushions of wood to receive the bridge, in descending the posts. H H are hollow cylinders, furnished at top with a cross rod and drums for the lifting chains K K, and a counterpoise of 6 cwt.

The weight of iron is,

Cast Iron,	14,312 lbs.
Wrought Iron,	9,000

You will see that the object in making the upper part of the bridge cast iron was to resist the crust, and that the lower part was wrought to resist extension.

Will you send me your Canal Map?

Your obedient humble servant,  
Wm. R. HOPKINS.

(From the New-York American.)

I am one among the many who hailed with delight the Report of the Directors of the New York and Erie Railroad, published in your paper of the 3d inst. This document I consider as putting an end to all doubts, on the subject of the construction of that great work, and silencing at once the carls of its enemies, and the fears of its friends. Confidence is now firm, that New York will have the honor of constructing the greatest railroad, as she has of making the largest canal, in the world;

and what is more, of taking the lead in both grand enterprises.

I was particularly struck with the facts mentioned in the Report, in relation to the many branches proposed to be connected with this main route, leading to various parts of the State. The branch leading through the Unadilla valley to Utica, especially, must prove of great importance, connecting with a point where so many great public improvements concentrate, and penetrating into the heart of the most flourishing country in the world. This branch is called the Utica and Susquehanna Railroad, and, as I understand, is now in actual progress. The advantages of such a communication must be obvious to all. Allowed to transport freight as well as passengers, it enables the city and country to transact business, as usual, even after the canals and rivers are closed by the frost; it affords a winter outlet for the produce of the farmer, who can take it to Utica by sleighing, as soon as it is ready for market, and get his money, instead of waiting, much to his inconvenience and loss, till the canals are open; and, in short, it facilitates very by the transaction of business, not only with the centre of our own flourishing State, but with the great West in general.

There is another point of view, in which the branch to which I allude, is of importance. Public opinion, has fixed upon Utica as the seat of State government, and the removal will probably follow immediately the announcement of the census now taking; and a direct railroad communication from this city to the Capital of the State, especially as the sessions of the Legislature are generally held in the winter, will be a great convenience at least.

But there is still another point of view, in which the Utica and Susquehanna Branch is of more importance; I mean as a link in the chain of railroad communication to Lake Ontario. The distance from Utica to Oswego is less than 80 miles, and by continuing the railroad to the latter place, we communicate by the nearest possible route, with that Lake, the immense country bordering upon it, and the vast valley of the St. Lawrence. It may be a question, also, whether this will not prove in practice the best route of communication with the other great Lakes further west, especially when a ship canal is constructed on the American side round Niagara Falls. But these considerations, if followed up, would lead me into too vast a field for a newspaper article, and I will only add, that I hope the communication by railroad and canals, with the great Lakes, by way of Utica and Oswego, will meet the attention it deserves, at the approaching internal improvement Convention at Utica.

CURTIS.

(From the Ellenville, Cattaraugus Co. Republican.)

INTERNAL IMPROVEMENT.—CATTARAUGUS CO.—We would direct the attention of the reader and men of enterprise, to the communication of a "Dutchess County Farmer," which will be found in another column of this week's paper. The superior advantages which Cattaraugus possesses over many counties in this State, begin to attract the attention of men of enterprise. Cattaraugus, by its nature, one of the best counties in the State; her advantages are many, and need only to be examined and improved to become universally great. A water communication from Olean, in this county, into thirteen States of the Union, are advantages which every county of our State cannot boast of:—

Mr. Shankland: Sir—In looking through your interesting section of the State, and viewing the

advantages which a few weeks have enabled me to discover, I cannot but be surprised that our Eastern capitalists have not before improved them.—When the great fertility of the land, its aptitude for grazing and other purposes are known; when it is generally known that Cattaraugus is equal to any county in the State for grazing, and not inferior to many counties for raising wheat, corn, and other grain, it will be improved and its fertile hills and valleys will be covered with those useful animals, the sheep and the ox. There is land in the Eastern part of the State used for raising cattle and sheep, considered worth more than \$100 per acre. Lands here equally as good for that purpose are sold from three to twelve dollars per acre. So great a difference in the price of lands equally as valuable cannot long exist.

But independent of the fertility of the soil there are other advantages in this section equally if not more important. The extensive hydraulic privileges, the abundance of pine and oak timber in many parts of the county, the many indications in numerous places of extensive beds of coal, gypsum and lime, which have already been discovered, will have a tendency to make this county at no remote period one of the richest in the State. There has been during the last year more than three hundred million feet of lumber carried down the Allegany river, which at \$10 per thousand would be worth \$3,000,000. And there is no reason why there cannot be as extensive speculations in the lands in this section, situated as they are, where the timber can be so easily taken to market, as in the timber lands in Maine.

But when we see these advantages and take into consideration the population of the county, which is now nearly thirty thousand inhabitants, located where they must be particularly benefited by the great public improvements now in agitation, we can then form but an imperfect idea of the future wealth of this portion of the State. The New York and Erie Railroad, which is in extent and importance, before any public improvement in the world, and the Genesee canal, will make the location of Cattaraugus better (excepting the city and county of New York,) than any county in the State.

Either of these improvements will give this county the carrying trade of the eastern section of the United States—to thirteen of the southern, south western and western States. As goods can be transported much safer, cheaper and earlier in the spring on the river than on the lakes, the river would be preferred, and the trade of the rich, extensive valley of the Mississippi will be done through this channel. There is now a communication from Olean in this county, of more than 20,000 miles on navigable rivers into thirteen of the United States, which embrace half of the population of the Union. The produce of those States can be carried on this river to the Atlantic ocean, and the merchandise consumed there can be conveyed either by the way of the Erie and Genesee canal, or Hudson and Erie Railroad, and down the Allegany, making that river one of the greatest thoroughfares in the world. If the merchandise and produce of the eastern and south western States are exchanged through this channel it must create a steamboat conveyance on the Allegany not surpassed by that of the North river.

Why is there not a fair prospect of an extensive and smart and large city at the intersection of the Genesee canal and railroad with the Allegany river as any in the interior of America? It will have at least as many advantages as Buffalo.

From these facts it will be seen at once that this railroad and canal will not only enrich this county, but be of immense benefit to the city of New York, and of more importance to the United States than any other improvement that has yet been made.

Hoping that the citizens of your county may enlarge upon the many advantages which your interesting possession, I remain yours, &c.

A DUTCHESS COUNTY FARMER.  
Franklinville, 26th Oct., 1835.

WATERMAN TALKS.—A gentleman of this city has sold a lot on Ashton street, running into the Schuylkill at the corner of Filbert street, the proceeds of which paid for a water lot on the Delaware below Lombard street, of equal size. The former entirely unwharfed or improved otherwise, the latter has a wharf and large stores erected on the same. It was predicted not long since, that the time would come when the Schuylkill front of the city would be more valuable than that of the Delaware. How soon has that prediction been verified!—[U. S. Gazette.]

## REPORT.

To the Mechanics' Institute of the City of New-York, the General Committee of Arrangements respectfully report:

That the first Annual Fair of the Institute was held at Castle Garden, and that the Exhibition was opened to the public on the 29th of Sept. and continued until the 3d of the present month inclusive, during which time they estimate that 40,000 of their fellow citizens visited the Garden.

Although free admission was given to the members of the Institute and depositors of goods, and cards of invitation issued to the judges, the municipal authorities of this city and the neighboring places, the gentlemen connected with the press, and numerous distinguished individuals, the total receipts amounted to \$2,188, which it is believed will be found

very nearly or quite sufficient to defray the expenses on that occasion, a detailed account of which will be presented as soon as the Sub-Committee on Finance shall have closed their labors. This result is more flattering than could have been anticipated, when it is recollected that a beautiful plate for printing diplomas and a pair of dies for striking medals have been procured, and are now the property of the Institute; an expense which will necessarily not again recur. Among other advantages to the Institute, the accession of rising 300 members may be enumerated.

The Committee must remark, that the quantity and variety of the articles exhibited, exceeded their most sanguine expectations, and that the quality reflected the highest credit upon the skill and ingenuity of the contributors, and gave irresistible and gratifying evidence of the rapidity with which our country is advancing in the arts and in manufactures.

The Committee herewith submit notices of the various articles exhibited, and a list of the premiums that have been awarded. They have been prepared by their Sub-Committee on Premiums, and the attention of the Institute is invited to them.

Although the publication of these papers has been delayed for a longer period than was desirable, and many articles of merit have remained unnoticed in consequence of the want of information from contributors themselves, yet the Committee trust that the inexperience attendant upon, to them, a novel undertaking, will be considered a sufficient apology; and they feel assured that the valuable knowledge acquired in this first attempt will enable future Fairs to be conducted with greater pecuniary benefit to the Institute, and with increased interest to the public.

In presenting to you the results of our duties, and to the public a detailed exposition of the late Fair, it may not be irrelevant to the occasion to recall the cheering reflections arising from our present circumstances and future prospects.

It is impossible that we should not feel animated by the fact that our present number of active members is more than one thousand, and that the united energies of so large a portion of moral and intelligent citizens are, in their associate capacity, directed solely to the promotion of useful knowledge. Deeming knowledge both power and happiness, we should not be insensible to the influence which our efforts, well directed, may have upon our fellow citizens; nor can we think they will be unmindful of our objects and exertions. The diffusion of knowledge lays the foundation for every virtuous sentiment, and presents us with all the elements by which we are to be great or happy. Our means, derived from the public exhibition of American industry and individual contributions, concentrate in this great purpose, and we feel justified in anticipating a satisfactory result to ourselves, and an honorable appreciation by the public.

Lectures upon the Sciences and the Arts, a Reading Room and Library, now mark the efforts of our Association and the discriminating patronage of our liberal minded citizens. Further and still more efficient means are in progress to diffuse useful information, and thereby to advance the interests of a most important part of the community. These interests are, however, unlimited, and every honorable man, approving the objects we propose, is invited to co-operate in the measures and share in the effects of this Association. On reviewing our condition, our objects, and our resources, we are induced to proceed with additional zeal, we are stimulated to increased exertions, and encouraged in every laudable hope.

SAMUEL CARTER, Chairman.

L. D. GALE, Secretary.

## Notice of the various Articles exhibited, comprising the Premiums awarded.

### MACHINERY, MODELS, PHILOSOPHICAL APPARATUS AND INSTRUMENTS.

No. 8. *Double Power Under Shot Water Wheel.* Invented by W. F. Brown. This Wheel is simple in construction, and works with very little friction. From the form and relative position of the flights, and an inclined chute under the wheel, the water is used in the most effectual manner. The wheel can be driven with very little head, and works well when completely submerged. By the addition of gates, it will answer a good purpose for tide mills. The Committee have awarded to the inventor the Silver Medal of the Institute.

No. 2. *Bromly's Portable Shower Bath.* Considered very useful and ingenious. The Diploma of the Institute.

No. 124. *Assay Balance.* Jones & McDonald, 83 Fulton street. Workmanship beautiful, and sensible to the 500th part of a grain, when loaded with ten penny weight. The Committee award to the manufacturers the Silver Medal of the Institute.

No. 258. *Machine for Making Sea Biscuit.* Deposited by J. & C. Bruce, 121 Bowery. A very excellent invention, for which the Silver Medal of the Institute has been awarded.

No. 212. *Shingle Machine.* Invented by D. Flagg, and deposited by S. S. Webster. The Machine consists of a frame to support the machinery, a gate working vertically, with a frow or knife to cut the shingles from the bolt; a vibrating beam attached to this and to a crank-shaft to work the knife up and down; two knives to shave the shingles, with screws and wedges to graduate their distances, and to secure them; a driver, working horizontally, to drive the shingle through between the knives attached to the wrist of the crank-shaft by a pitman. In operating, the shingle bolt is placed on the rest against the guide plates, and as the crank-shaft revolves the end of the vibrating beam is brought down, whilst its other end ascends with the gate and knife which cuts off the shingle, and the next half revolution of the crank forces

forward the driver with the shingle, carrying it through the casing between the scoring saws and knives, where it is shaped and shaved.

With two or three horse power the Machine turns out from 120 to 150 shingles per minute, and probably without more waste of timber than by the common method. The Committee award the inventor the Silver Medal of the Institute.

No. 6. *A Continual Draft Buoyant Paddle Wheel.* By N. Dodge.

No. 26. *Centrifugal Pump.* By Isaac Sloan.

No. 1. *Patent Platform Scales.* By Fairbank. This appears to be a good article.

No. 29. *Model of a Weighing Machine.* By H. Bartley.

No. 31. *2 Steamboat Models.* By John Clark.

No. 149. *1 Platform Scale.* By John J. Rohr, 242 Canal street. The Diploma of the Institute.

No. 95. *Portable Grist Mill.* Invented by D. Fitzgerald. The Judges decided this Mill to be by far the best in its construction, and most convenient for use, they have ever become acquainted with, and the Committee have awarded the Silver Medal of the Institute.

No. 253. *Iron Grist Mill.* By Payne & Reynolds. In this Mill metal has been substituted in the parts where burr stone is commonly used. From its convenient size, and the rapidity with which it grinds corn, it promises to be very useful.

No. 201. *Model of a Grist Mill.* By I. Sloan.

No. 262. *Iron Threshing Machine.* By Wm. G. Borland, Herkimer, N. Y. Yale & Curtis Patentees.

No. 217. *Threshing Machine.* By S. F. Warren.

No. 286. *Threshing Machine.* By James Maxwell.

No. 243. *Rotary Air Pump, new plan; Electro-Magnetic Apparatus.* By Hiram French, of Lansingburgh. Both of these are very ingenious, and worthy of the Diploma of the Institute.

No. 245. *Double Thread Screw Press.* A very good contrivance.

No. 197. *1 Copying Press, 1 Notarial Press.* Both of good workmanship. For exhibition, by Robert Hoe & Co. the makers.

No. 221. *Machine for Pressing Straw Hats.* By James Maxwell, 259 Bowery. Was considered by the Judges a very ingenious and valuable contrivance. The Committee have awarded to Mr. Maxwell the Silver Medal of the Institute.

No. 277. *1 Cider Mill.* Justin Ware. Simple and good. The Diploma of the Institute has been awarded.

279. *Safety Ladder.* Invented by John Schriber. Simple in its construction, expeditious in its operation, and with the assistance of guys on each side to prevent the oscillations attendant upon great elevations, may be made very useful. The Committee have awarded the Diploma of the Institute to the inventor.

No. 49. *1 Iron Safe,* made by Birk-

beck & Co. Brooklyn, L. I. The Silver Medal of the Institute.

No. 76. *1 Iron Safe,* by Cruttenden & Riley, Brooklyn, L. I. The Diploma of the Institute.

No. 57. *Iron Safes,* by J. Delano. These were considered very good.

No. 37. *Moveable Platform Scale.* Cole & Smith. The principle of this Scale was pronounced very correct, and the workmanship excellent. The Committee, at the recommendation of the Judges, have awarded to the makers the Silver Medal of the Institute.

No. 190. *Model of Steam Safety Boiler.* Invented by G. R. Clarke. This consists of a double boiler, one inclosed within another.

No. 33. *Model of an Apparatus for preventing explosions in Steam Boilers.* Invented by S. Kennedy, 22 Hudson street.

No. 236. *Machines for Morticing,* by George Page. One for cutting common mortices, and one for morticing Wheel Hubs. Both are very good and valuable machines. The Silver Medal of the Institute was awarded to the inventor.

No. 189. *Hydraulic Pump,* by Ridgeway & Co. A good article.

No. 120. *1 Pump, Suction and Force,* by John Conroy.

No. 215. *Machine for Cutting Straw,* by H. Haxley & Co.

No. 176. *Model of a Rail Road Axle.* Deposited by D. K. Minor. Very ingenious, and promises to be useful.

No. 149. *Jack Screw,* by John J. Rohr, 242 Canal street. Very good.

No. 223. *Jack Screws,* by W. Ballard. Good articles.

No. 32. *Portable Forge and Bellows.* Fairley, Concklin & Co. Very excellent, and so constructed as to be removed with great facility. The Committee have awarded a Silver Medal.

No. 68. *Model of a Patent Bellows.* By C. D. Holmes. This is a neat wood model of a Square Bellows, blowing a stream of air, at both the up and down strokes, into a rising head. The intention of the inventor is to produce a steady blast—a desideratum in the arts. The workmanship of the model is quite creditable to the inventor; but the object to be attained, namely, a steady blast, will, we fear, be a failure. In practice it will be found that the blast will not be so strong at the end of the stroke, on change of motion, as it will when the piston is in the centre, or half way of the box. The Bellows now in use, to wit, leather Bellows, with rising head-tub or cylinder, will each of them produce quite as steady a blast as the one referred to. Probably the best way of producing a perfectly steady blast, is either by using a fan Bellows, or two or more cylinder Bellows, acting at half centres, blowing into a reservoir or rising head.

No. 41. *Model of a Patent Lithographic Printing Press.* By P. Langlume. For exhibition.

No. 88. *1 Platinum Lamp, and Model of a Door Spring.* By F. Schott. The workmanship of the Lamp was good, and the price, \$2, although above that required in

the list of premiums offered, is less than the same article, of equal quality, has been previously sold at. The Committee have awarded to Mr. Schott a Diploma for the Door Spring, which is ingenious and well calculated for the purpose for which it is intended.

No. 35. *4 Ploughs and Improved Windlass.* By Wiley, Concklin & Co. Peekskill. For the Windlass, the Silver Medal of the Institute has been awarded. It is neat and compact, and so constructed that the lever need not be removed, and therefore much time is saved in its operation.

No. 252. *Model Churn, Angevine's Patent.* Deposited by F. S. Lane. Considered good.

No. 134. *Washing Machine.* By Asa W. Soule. Thought to be a good article.

No. 265. *Model of a Machine for Polishing Plate Glass.* The property of the Institute.

No. 220. *Model of a Fire Engine.* L. Campbell.

No. 209. *Electrical Cannon, and Cylinder for Electrical Machine, also Model of a Steam Engine.* Jonas Humbert, jr. Deposited for exhibition.

No. 104. *Balance Level.* Invented by F. Bartholomew. Intended as a substitute for the common Spirit Level. Workmanship very good.

No. 91. *Dipping Needle, Transparent Compass, Circular Protractor.* By Brown & Hunt. The Dipping Needle has the pivots turned very fine, and acting on agates. The horizontal circle on which the instrument turns is divided into single degrees, and has opposite verniers to read to five minutes. Spirit Levels, with adjusting screws, are also attached. Both the action and workmanship of the instrument are very excellent. The Circular Protractor has opposite verniers to read to single minutes, with an additional arm to carry the Rack Work motion. This instrument, as well as the Transparent Mariner's Compass, is a beautiful specimen. The Committee have awarded to the makers a general premium of the Silver Medal, and for each of the articles noticed, the Diploma of the Institute.

No. 133. *A Barometer, Thermometer, Hydrometer, in one Case. 10 Thermometers, 1 Surveyor's Compass.* By John Roach, 3 Wall street. The Committee have awarded Mr. Roach a Diploma for the Compass, which is a well made instrument.

No. 289. *Printing Press of the New-York Transcript.* This Press is the Double Napier, improved by Mr. S. Newton, one of the firm of Robt. Hoe & Co. and was built for the Editors of the Transcript, by those enterprising gentlemen. The Press will run from 23 to 2500 impressions the hour, and was put in operation and the paper worked off every evening during the exhibition. The beauty of its operation attracted the attention of thousands of the visitors at the Fair. The Committee take this opportunity of making their acknowledgments to the Editors, Messrs. Hayward, Stanley & Co. for the kindness evinced by them in removing their press, at considerable expense, to the Garden,

and they have no doubt that its exhibition contributed much to the gratification of visitors.

No. 71. *Armillary Sphere, or Problem Globe*. G. Vale, 84 Roosevelt street. Considered by the Committee of very great practical importance. The Diploma of the Institute.

No. 102. *An Extension Ladder, or Fire Escape*. John B. Ganser, 132 Chatham street, New-York City. Not having seen its practical operation, in cases of fire, the Committee are not prepared to speak of its utility; but if it can be made effective its advantages are incalculable. The inventor is entitled to great praise for so laudable an effort.

No. 103. *Model of a Brig*. George Slaughter, 7 Division street, New-York City. For exhibition.

No. 140. *2 Artificial Legs*. James Kent, Brooklyn, N. Y. The Committee cannot, within the limits allowed them by this report, do justice to the skill and ingenuity of Mr. Kent in the manufacture of these articles. The application of artificial feet to the stumps, below the knee, having been tried and failing in Europe, the success of Mr. Kent will be duly appreciated, we believe, by a discriminating public. Lieut. Young having lost both feet, these artificial feet have been applied with complete success, so that the gentleman walks easily with the assistance of a cane only; he is a relative of Mr. Stoneall, Shakespeare Hotel. The Committee award the Silver Medal of the Institute for the Lady's Foot.

No. 207. *1 Gig Patent Screw Boat—of Spanish Cedar*. Josiah Farr. This was uniformly admired for the beauty of its model, and its superior finish. The Committee are happy in awarding for so elegant an article, and one so deserving of competition in this City, the Silver Medal of the Institute.

No. 142. *Machine for Splicing Leather for Machine Cards*. Isaac Pierce. For exhibition.

No. 251. *2 Magnets*. Jonas Humbert, jr. These were very powerful, and well made. For exhibition.

#### CHEMICALS.

No. 23. *Specimens of Polishing Powder. Do. Paste and Water Proof Paste*. To be reported upon and information communicated on trial.

No. 67. *4 Boxes Austen's Patent Indian Rubber Oil Blacking*. Russel Austen, 113 Pearl street.

Said to be water article for the judges, can say with specimens they safe in inviting of the article.

*Lemon Syrup*. the Committee ubited, and, in quality. The

ster. Duncan & id West streets. t the Committee

could not decide upon its merits in a powdered state, without a trial.

No. 96. *Crystallized Prussiate of Potash*. Richard Brakell. Considered a most splendid specimen of crystallization, and indicating great purity.

No. 110. *1 Case of Perfumery, and 2 Glass Jars of Fancy Soap*. Johnson & Co. 39 Cedar street. The quality of these articles, generally, was the very best, and they were got up in elegant style. The Diploma of the Institute.

No. 118. *5 Samples of Soap Stone Paint*. F. Bunker, 100 Barclay street, N. Y. This new article the Committee think bids fair to be very valuable in the arts; they therefore cheerfully recommend it to the public for a more particular trial of its merits.

No. 44. *1 Dozen Lemon Syrup*. M. Haulenbeck, 144 Nassau street. Considered of excellent quality.

No. 196. *Lucifer Matches*. Hopper, 364 Broadway. For exhibition.

No. 158. *1 Bottle of Writing Ink*. Noble Heath, No. 8 Heater street. The Committee think this the best ink they have ever seen, and they recommend it to public notice. A remarkable property of this ink is that it presents, when used on cards, &c all the prismatic rays; it is really quite unique, and of surpassing beauty. The Diploma of the Institute.

No. 202. *1 Box Alum, 1 do. Saltpetre, 1 do. Copperas, 1 do. Oil Vitriol*. Messrs. E. Peck & Son. The Copperas the Committee consider of a superior quality, and not surpassed by any ever manufactured. The Nitre was thought to be of the best quality also, but the Committee could not well determine its purity. The Oil of Vitriol was excellent. The Diploma of the Institute.

No. 124. *Chemical Preparations*. Dr. Lewis Feuchtwanger, Broadway, New-York City. The great variety of Chemical and Medicinal preparations here presented for exhibition, attracted the particular attention of the Committee, and they would say, in general terms, that the preparations were of great purity and usefulness, and worthy of special notice. The indefatigable industry of Mr. F. in manufacturing chemicals, hitherto imported, many of which are superior to the foreign article, will, we trust, be duly appreciated by the public.

No. 39. *1 Box of White Lead*. E. Clark, Saugerties, N. Y. This specimen was considered equal, if not superior, to any in the country. The great purity of an article so worthy of competition, induces the Committee to award the Silver Medal of the Institute.

No. 271. *1 Can of Copal Varnish*. Wm. Tildon. To be tested and reported upon.

No. 182. *1 Can of Coach Varnish*. P. B. Smith. To be tested and reported upon hereafter.

No. 206. *2 Bottles of Ink, and 1 Frame*. F. B. Callender.

#### BOOTS, SHOES, LASTS, AND LEATHER.

No. 36. *Ladies' Boots and Shoes*. F. S. & M. Morris, 388 Grand street, N. Y. No. 63, *1 Pair Dancing Pumps*. J.

Field, Newark, N. J. Considered of excellent quality.

No. 69. *Gentlemen's Gaiter Boots*. Lewis J. Durand, 159 Centre street. Best exhibited. The Diploma of the Institute.

No. 70. *Ladies' Slips and Wadded Boots*. John Broqua, 331 Broadway, New-York City. The Committee consider the Wadded Boots the best article exhibited. The Diploma of the Institute.

No. 83. *Children's Pumps, Sandal Slips, and Misses' Gaiter Boots*. Thomas Weeks, 157 Delancy street. For the best pair of Misses' Gaiter Boots and Sandal Slips, the Committee awarded the Diploma of the Institute.

No. 106. *1 Pair Light Boots, 1 Pair Light Pump Boots, 1 Pair Cork Sole Pump Boots, 1 Pair Double Cork Sole Pump Boots, 1 Pair Dancing Pumps, 1 Pair Opera Pumps*. Kimble & Rogers, 104 Broadway, New-York City. The light boots and dancing pumps the Committee consider the best exhibited; they therefore award the Diploma of the Institute.

No. 135. *14 Pair Moccasins*. Mrs. Nichols, 106 Chatham street. These were considered very good by the Committee, and worthy the Diploma of the Institute.

No. 136. *2 Boxes of Lasts*. G. Coit & Sons, 305 Pearl street. The Gentlemen's Boot Lasts were the best offered, and thought worthy the Diploma of the Institute.

No. 145. *Ladies' Gaiter Boots and Slippers*. Made by W. J. Watson, 67 Fulton street, Brooklyn, N. Y. The best exhibited. The Silver Medal and Diploma of the Institute.

No. 160. *1 Pair Double Sole Water Proof Boots*. Robert Walker, 44 Greenwich street. These were the second best exhibited, and of an excellent quality.

No. 191. *4 Pairs Water Proof Boots*. Henry Briach. These were considered by the Committee most excellent water proof articles. The Diploma of the Institute.

No. 51. *Ladies' Gaiter Boot Lasts*. Deposited by C. R. Williams, 62 Frankfort street. Considered the best offered. The Diploma of the Institute.

No. 194. *1 Side of Sole Leather*. Wm. Brown, Brooklyn. This was of an excellent quality, and an article the Committee were pleased to see offered for competition. The Diploma of the Institute.

No. 107. *1 Double Sole Boot, 2 Light do. and 1 Shoe*. C. B. & J. C. Green, 416 Broadway. Very good workmanship.

No. 204. *1 Case, 2 Pair of Boots*. Robert Webber.

No. 210. *1 Case Ladies' Shoes*. Benjamin Shaw.

No. 62. *1 Pair of Dancing Pumps*. E. Severance, Newark, N. J.

No. 211. *3 Lasts*. Wm. Shaw.

#### HATS, CAPS, AND FURS.

No. 69. *1 Case of Water Proof Hats*. Edward Townley, 148 Canal street.

No. 111. *3 Silk Hats*. G. B. Alvord, 12 Bowery. These specimens were of

nal notice of the Committee. For the best \$3.50 Hat they award the Silver Medal of the Institute.

No. 114. 1 *Silk Hat*. Isaac M. Henderson, 133 Lewis street.

No. 92. 1 *Case of Otter Ladies' Caps, do. Gentlemen's, and 1 do. Misses*. Charles C. Plaisted. The Committee consider these articles worthy of particular notice, and recommend Mr. Plaisted's work to the patronage of the public.

No. 163. 1 *Satin Beaver Lady's Hat, Drab do. do.* S. Tuttle, 208 Chatham street. The Committee thought these, of superior quality, and received the specimen the elegance of their finish, deserving the Diploma of the Institute.

No. 233. 3 *Straw Hats*. Mrs. Harrison, 34 Division street. The ladies merit particular attention in the specimens of mechanical skill which they present for exhibition to the public, and the Committee are happy to find that attention so well deserved, as in Mrs. Harrison's Hats. The extreme fineness of the braid, the charming neatness with which they were sewed, and this perfection of the model, though unpressed, entitles this lady, in their opinion, to the Silver Medal of the Institute.

No. 238. 1 *Russia Silver Fox Boa, 1 Siberian Blue Ice-Fox do., 1 do. Squirrel Cape, 1 do. Blue Fox do.* Christian G. Gunther. Considered very beautiful, and finely made. The Diploma of the Institute.

No. 248. 2 *Fur Hats*. A. & A. Barker. The Committee have thought these highly creditable specimens of workmanship, and therefore award the Diploma of the Institute.

No. 261. 2 *Ladies' Hats*. B. J. & J. W. Hunt. These were beautiful specimens of Ladies' Beaver Hats, and worthy the Diploma of the Institute.

No. 143. 4 *Otter Caps*. James La-tourrette, Pearl street. These were specimens of great superiority, and were not excelled by any exhibited, if they can be equalled in the country. The Committee cheerfully award the Silver Medal of the Institute.

#### GOLD AND SILVER ARTICLES.

No. 43. A *Case of Watch Dials*. William J. Mullen, New-York City. The Committee consider these specimens of American workmanship worthy of special notice, both for originality of design and elegance of workmanship. They have never been equalled by any articles of the kind, foreign or domestic; and when it is considered that heretofore a large sum of money has been sent abroad annually for these articles, the Committee feel at liberty to express unqualified praise in favor of the articles here exhibited; they therefore award to Mr. Mullen the Silver Medal of the Institute.

No. 52. 19 *Articles manufactured of Argentine, or German Silver*. H. Powell, Belleville, New-Jersey. These articles were of superior workmanship. The Silver Medal of the Institute.

No. 127. 1 *Case Pencil Cases, (No. 42, Bear Point.)* Woodward & Hale.

Some of these evinced a most elegant style of workmanship, whilst the patterns were of the most chaste and approved kinds.

No. 184. 1 *Case of Spectacles*. J. L. Moore, 142 Chatham street. Considered neat and elegant patterns, and very finely wrought. The Diploma of the Institute.

No. 213. *Patent Lever Temple Spectacles*. P. Williamson, 270 Division street. These are an improvement of the ordinary Spectacle Frame, by means of the intersecting levers of which the temple part is composed. The levers being about one inch in length, are made circular, so that when riveted to each other, they are adapted to the conformation of the head. The whole arrangement of levers gives to these spectacle bows great elasticity and uniformity of action, and is, withal, very neat and novel. The Diploma of the Institute.

No. 228. *Gold and Silver Thimbles, and Spectacles*. Platt & Brothers. The patterns of the Thimbles were much admired, and the Spectacle Bows were highly distinguished for their neatness, convenience, and elegance of finish. The Committee awarded the Diploma of the Institute.

No. 242. 2 *Bars of German Silver, 2 Rolls do. do.* Dr. Spieker, 191 William street, N. York. Considered by the Committee a valuable article, and capable of being appropriated to a great variety of useful domestic purposes: these specimens were of the finest quality. The Diploma of the Institute.

No. 205. 24 *Watch Dials*. Berger Webster & Co. These were a beautiful article, and thought by the Committee worthy of the Diploma of the Institute.

#### INDIAN RUBBER ARTICLES.

No. 123. 2 *Pair Indian Rubber Boots, 1 do. Shoes, 1 Knee Cap, and 1 Shoulder Cap*. Stephen C. Smith, 66 Chatham street. Many of these articles were considered by the Committee of superior quality, and particularly the *Ladies' Shoes*, from the admirable manner in which the cloth linings were incorporated with the rubber, so as to prevent them from becoming troublesome to the wearer, as they often do by being detached from the shoe. This is an invention of Mr. Smith's, and one which he applies with equal success to boots and clothing. The Diploma of the Institute.

No. 59. 17 *Pairs of Indian Rubber Shoes, also 1 piece Virgin Rubber, and 1 Sheet*. Corning & Son, 144 Water street. Considered of an excellent quality.

No. 179. *Machinery Banding, Stage Thorough Brace, and Gas Bag of Indian Rubber*. H. Raymond & Co. The superior excellence, and practical advantage, of the first named articles, entitle the gentlemen, as the Committee think, to the Silver Medal of the Institute.

No. 216. *Specimens of Indian Rubber*. Charles Goodyear, 13 Gold street. The Committee are of the opinion that of all the useful modifications and applications of this article, none exceeds, in novelty

or utility, that discovered by Mr. Goodyear. The original coloring matter, by a process peculiarly his own, is removed from the material, and any other given to it, whilst, at the same time, it is deprived of all of its unctuous and aqueous qualities, and yet retains its elasticity, durability, and imperviousness. The Committee can have no doubt of the utility and success of this discovery, and therefore, recommend it to the immediate attention of the public. The Silver Medal of the Institute.

No. 232. 1 *Roll Indian Rubber, 1 Coat and Pantaloon of do.* Samuel Chase.

No. 272. *Case of Indian Rubber Balls*. H. Percival & Co. Considered very good, and handsomely made.

#### CABINET FURNITURE.

No. 9. *Camp-Bed and Table, (enclosed in the lid of a trunk.)* Wm. W. Woolley, Broadway, New-York City. Considered remarkably convenient and ingenious. It will, no doubt, be in great demand, particularly with travellers. The Silver Medal of the Institute.

No. 40. 1 *Lady's Work Box*. John F. Hanson, 57 Poplar street, Brooklyn, N. Y. First rate workmanship. The Diploma of the Institute.

No. 108. 1 *White Polished Door*. Solomon Pancoast, 54 Spring street, New-York City. This was an elegant article, and its beautiful finish was particularly admired. The Diploma of the Institute.

No. 125. 1 *Lady's Work Box*. Edward Senior, 138 Bleeker street. Considered a good specimen of workmanship.

No. 81. *Lady's Work Box*. A. Patterson.

No. 171. 1 *Centre Table, Mosaic top*. Wm. Fulcher, 88 Elm street. An elegant article, and worthy the Diploma of the Institute.

No. 187. 1 *Sofa Bedstead*. Francis Breckles. Considered by the Committee the best specimen offered, and really of superior excellence. They award to the maker the Silver Medal of the Institute.

No. 193. 1 *Breccia Top Centre Table—Column of Marble*. Wm. Vine. The Diploma of the Institute.

No. 287. 1 *Sofa and 1 Centre Table*. S. Carter, 51 Beekman street. For exhibition.

No. 144. 1 *Portable Desk*. Lawrence Ryer. For exhibition.

No. 154. 1 *Sofa Bedstead*. W. Woolley, Broadway, New-York City. In Mr. Woolley's good style of workmanship.

No. 237. 1 *Divan Bedstead and Royal Foot Rest*. W. Woolley.

#### CUTLERY, EDGE TOOLS, AND HARDWARE.

No. 7. 2 *Pounds Bright Wire—six miles long. 1 do. fine do. 1 Bundle Square Wire, and 1 do. Round do.* No. 12, Copper. From E. Peck & Son, New-York City. Considered wrought in a superior manner. The Silver Medal of the Institute for the 2 lbs. bright wire.

No. 82. 62 *Gross Wood Screws*. Goodell & Co. Newburg, N. Y. The Diploma of the Institute.

No. 824. *Four Plumb Spirit Levels.* J. & H. M. Pool, Easton, Mass. N. B. The Messrs. Pools are the inventors of this valuable instrument, and secured the patent in 1833. Too much credit cannot be awarded to these enterprising gentlemen, for their useful invention. The Silver Medal of the Institute.

No. 824. *5 1/2 dozen Shovels and Spades.* Deposited by Mitchell Ames & Co. No. 2 Liberty street. Considered very good.

No. 98. *14 Pairs Shears.* Rochus Heinisch. The specimens exhibited were of superior workmanship and finish, and deserving public notice. The Silver Medal of the Institute.

No. 112. *1 Case of Stocks and Dies.* Daniel B. King, Waterford, N. Y. The Committee are of the opinion that these are equal, if not superior, to any of the kind in the country. They award the Silver Medal of the Institute.

No. 80. *Invoice of Files.* George Rothery, Bloomfield, N. J. Many of these were considered equal to any imported, doing much credit to the manufacturer, by so successful a competition with the foreign article. The Silver Medal of the Institute.

No. 132. *1 Case Steel Pens.* C. Atwood, 72 Maiden Lane. Considered very good in style and execution. The Diploma of the Institute.

No. 141. *6 Dirk Knives.* Robert Ward. The Committee think these specimens of workmanship have great elegance and perfection. They award the Diploma of the Institute.

No. 167. *4 Bundles of Iron Wire.* E. Peck & Son. Those specimens were thought by the Committee to be of superior quality and workmanship.

No. 268. *2 Augers.* Upson & Campfield, Humphreysville, Ct. These were superior articles, doing much credit to the manufacturers.

No. 269. *9 Auger Bits.* Clark & Hartshorn, Humphreysville, Ct. These articles have been brought to great perfection by the makers.

No. 274. *One Case of Stocks, Dies and Taps.* I. Sloat. The Committee considered these very good, and awarded the Diploma of the Institute.

No. 276. *1 Set of Coach Springs.* Henry C. Jones, Newark, N. J. A superior article, and entitled to the particular attention of the public, as well as the Silver Medal of the Institute.

No. 173. *Traphining Instrument, and 4 Pairs of Razors.* C. A. Zeitz. The Surgical Instrument here exhibited is certainly a very beautiful specimen of workmanship. The absence of the ingenious inventor prevented a better knowledge of its applicability. The notice of the professors of surgery is invited to it. The Committee award the Silver Medal of the Institute.

No. 177. *4 Boards of Brass Ware.* M. W. & J. A. Emmons. For the excellence of this Ware the Committee award the Diploma of the Institute.

No. 200. *1 Concave Screw Auger.* Wheeler & French, 18 Pine street. The Committee consider this a very valuable

article, and one which they cannot commend too highly to public notice. They award the Silver Medal of the Institute.

No. 214. *Patent Graduated Diamond-Point Pens.* George Williamson, 270 Division street.

No. 250. *1 Clock Main Spring, 2 Chronometer do. 1 Lever and 1 Lepine do.* Desaulles & Clerc, 27 Madison street. These were most excellent specimens of American workmanship, equal, if not superior, to any imported. The manufacturers should be patronized in this new article. The Diploma of the Institute.

#### MUSICAL INSTRUMENTS.

No. 60. *1 Grand 7 Octave Piano Forte, and 1 do. 6 Octave do.* Bridgeland & Jardine, 338 Bleecker street; sold by Otto Torp & Co. Broadway. The latter of these was distinguished for mellowness and sweetness of tone, and considered the second best exhibited; for which the Committee awarded the Diploma of the Institute.

No. 89. *1 Piano Forte—grand action.* John Abbot, 66 Walker street. The Silver Medal of the Institute. The Committee consider this instrument possessed of great brilliancy of tone, pleasant touch, and made in a superior manner.

No. 151. *1 Bass Double-slide Trombone, 1 Kent or Keyed Bugle, 1 Keyed Trumpet, 1 Tenor Trombone, and 1 Slide Trumpet.* John Rosenberk, Utica, N. Y. Though there was no competition in these articles, the Committee are gratified in stating that, in addition to their own judgment, they have that of some of the best performers in this or any other country, for saying that these specimens have never been surpassed by any of the kind, either for tone or workmanship. They award the maker the Silver Medal of the Institute.

No. 165. *1 Piano Forte—clutch-round cornered.* A. G. Smith.

#### PRINTING AND BOOK BINDING.

No. 20. *Fancy Card Printing.* By C. L. Adams. These were uncommonly beautiful specimens, and quite equal to engraving. The Diploma of the Institute.

No. 49. *Specimens of Xylographic Engraving.* Wright & Prentiss, 45 Maiden Lane. Considered beautiful specimens of the art. The Silver Medal of the Institute.

No. 65. *1 Rotary Printing Press—for Cards.* Charles F. Voórhiess, Newark, N. J. The Committee think this Press extremely ingenious, and admirably adapted for the printing of Cards. The originality displayed in the invention, and the rapidity with which it executes work of this kind, is deserving of general, as well as of our own particular notice. The Silver Medal of the Institute.

No. 117. *6 Blank Books.* David Felt, 245 Pearl street. The specimens of Binding here exhibited are of superior order in the taste with which they are got up, the elegance of their style, and the strength of their workmanship. The spirit of enterprise manifested by the manu-

facturer, in producing specimens of these, the Committee think deserve special notice from the public. They award the Silver Medal of the Institute.

No. 126. *5 Boxes Printing Ink.* P. Prout, 63 Spring street. These specimens are so well known as not to need commendation from the Committee.

No. 259. *1 Printing Press.* James Maxwell, 259 Bowery, N. York. Considered an excellent press both for the perfection of its work, and its simplicity. The committee were much pleased with it, and awarded the Diploma of the Institute.

No. 148. *4 Specimen Books of Types, 16 Pages of Types, and a Furnace in casting Types.* George Bruce & Co., New York City. These books exhibited great perfection and beauty to which the manufacturers of types and typographical ornaments and illustrations have brought the art.

No. 254. *Specimens of Bookbinding.* Coolidge & Lambert, 65 Wall street. These were very good specimens of work.

No. 109. *1 Bible.* Charles A. For exhibition.

No. 273. *2 Composition Rollers.* Thomas. For exhibition.

#### FINE AND ORNAMENTAL ARTS.

No. 3. *Astral Lamp, Candlestick, Writing Stands, Portrait Frame, Ski Stubs, &c., &c., made of Anthracite Coal.* From E. W. Kirk, 233 Chestnut street Philadelphia. By Anderson & Wainwright. The Silver Medal of the Institute. These specimens were considered by the Committee superior, in point of workmanship to any articles of the kind ever exhibited in this country.

No. 10. *Imitation of Quincy Granite.* A. Kent, 100 Concord street, Brooklyn, N. Y. A very fine specimen of imitation.

No. 15. *2 Pieces of Sculptured Quartz Granite.* A. Lawrence. Very good workmanship. The Silver Medal of the Institute.

No. 16. *Pantographic Drawing of Chief Justice Marshall.* Wm. L. Ormsby, 11 Nassau street, New-York City. Considered of superior merit. The Diploma of the Institute.

No. 19. *Transparencies and Etchings.* W. I. Hannington. Considered extremely beautiful. The perfection to which Mr. Hannington has brought this art does him great credit. The Committee have awarded the Silver Medal of the Institute.

No. 22. *Ionic Capitals—two specimens of Carving in Wood.* Luff & Moore, 105 Elm-st. New-York City. Fine executed. The Diploma of the Institute.

No. 25. *12 Specimens of Penmanship.* By Isaac Goward. Exhibiting much industry.

No. 46. *19 Specimen Imitations of Rosewood, Mahogany, Marble, &c. in Mosaic Table Top,* in this collection, of inimitably fine, and worthy of the admiration uniformly expressed by visitors. Executed by George Bird, 94 Andover street. The Silver Medal of the Institute.

No. 48. *Two Framed Designs.* By Thomas, 37 Canal street, New-Y.

one representing a magnificent duct and Bridge across the East river, from Brooklyn to New-York, the committee think indicative of no ordinary talent in the young artist, by whom it was executed. The Bridge is supposed to have a row of Stores on either side; and abutments and arches, 6 in number, made of granite, except the central one, which is designed to be of cast iron, 180 ft. high.

No. 61. 1 *Painting of a Dog's Head*. William Malbone. The Committee considered this a picture of superior merit, exhibiting great freedom in penciling and fineness of touch, for which they award the Silver Medal of the Institute.

No. 64. 1 *Painting of St. John*. John Bon, 94 Anthony street, New-York City. The execution of this was thought to be good.

No. 74. *Framed Specimen of Carving*. Heron, 419 Water street—Frame executed by Mott & Stuart. The ornamental work is very ingeniously wrought, with much labor.

No. 84. 3 *Framed Engravings*. Geo. Nicott, 359 Broadway. Considered very spirited Drawings, and well executed. The Diploma of the Institute.

No. 88. *Framed Samples of Clinton's Portland Cement*. Deposited by N. H. Gale. The Diploma of the Institute. The committee are induced to invite public attention to this article, from the great credit it is said to possess, by those who have used it, for the walls of buildings; much as it is both very beautiful and strong. From its great hardness, it is susceptible of being washed, like marble, without affecting its polish. Patented. Charles Clinton, West Town, Orange N. Y.

No. 116. 11 *Specimens of Penmanship*. John W. S. Mackie. The Committee are of the opinion that Mr. Mackie's specimens of writing are distinguished by a free and intelligible style.

No. 246. 1 *Framed Drawing, City of Brooklyn*, N. Y. Wm. Brown.—This Drawing did the artist much credit, particularly on account of its shading.

No. 222. 1 *Vase of Shell Work*. John B.

No. 93. 1 *Specimen of Needle Work, after Creatoris*, 1 *Bell Rope* and 1 *Lamp stand*. Mrs. Hardrop, 3 Roosevelt street. The first of these articles, wrought with the needle, is considered by the committee of extraordinary merit; exhibiting both great skill and uncommon industry. They are not surprised that it received, as it deserved, the uniform expressions of admiration from the visitants at the Fair: they therefore award to the artist the Silver Medal of the Institute.

No. 113. *Case of Shell Work and Shells*. John Lee, 271 Broadway, New-York City. These specimens of ingenious workmanship the Committee consider very flattering evidences of the taste and skill of the artist; they therefore award the Diploma of the Institute.

No. 119. *Specimens of Penmanship*. William Jones, 183 Broadway. The execution of these specimens is particularly

free and bold, and, in these respects, worthy of special notice.

No. 183. 1 *Large Glass Punch Bowl*. Birch & Scarlett, 12 Liberty street. This massive article, from the truly beautiful manner in which it was cut, and the richness of its pattern, was particularly admired by all who saw it. The Committee take pleasure in awarding the Diploma of the Institute.

No. 147. *Pedestal of Scagliola*. Patrick Foley. The almost perfect resemblance of this to marble, both in touch and color, with the beautiful polish which it possesses, has received particular attention from the Committee. The Diploma of the Institute.

No. 153. *Statue of Napoleon Bonaparte, in Brown Stone*. David White, 80 Charlton street. The execution of this specimen of sculpture, by a journeyman stone cutter, does the artist much credit.

No. 156. 1 *Case of Artificial Teeth*. James Alcock. The Committee were particularly attracted to these specimens of a useful and ornamental art, by the great perfection of the enameling; a point not sufficiently considered in estimating the value of artificial teeth. They award the Diploma of the Institute.

No. 157. *Specimens of the Mending of Lace*. Mrs. Heath, No. 8 Hester street. It is with no common satisfaction the Committee recommend this art to public notice. The rents in the specimens exhibited, though large, could scarcely be detected by the closest examination. The Diploma of the Institute.

No. 162. *Specimens of Pantographic Engraving*. T. S. Woodcock. These specimens prove that this valuable branch of the arts, though somewhat new, has been brought to a degree of elegant perfection. The Committee award the artist the Silver Medal of the Institute.

No. 178. 2 *Framed Drawings*. J. Davis. The taste and art displayed in these Architectural Drawings, together with the effective management of the lights and shades, readily show them to have come from the hand of a skillful artist. The Diploma of the Institute.

No. 192. 1 *Colossal Bust of McDonald Clarke*. James V. Stout. The truth of the likeness, and the superior finish of this specimen of modelling, the Committee think entitles this to more than ordinary notice. It will have appeared to all who have seen it that, in addition to the likeness and finish, it is in perfect keeping, and replete with the spirit of life. It has not been surpassed, if equalled, by any specimen of the kind in the country. The fact that this is the second effort at modelling from life by this young artist, and yet that the relative proportions, the character and perfection of anatomical development, has been so wonderfully preserved in every delineation, goes further to prove his talents in the minds of mature judges, than our public expression of praise. The Silver Medal of the Institute.

No. 195. *A Bank Note Plate*. C. P. Harrison. Considered good.

No. 219. 6 *Specimens of Scagliola*. J.

W. Clark. These specimens were extremely beautiful, and particularly admired by the Committee for the variety of their colors, and for the ornamental purposes to which the article may be applied. They award to the manufacturer the Diploma of the Institute.

No. 231. 2 *Vases of Artificial Flowers, made of Feathers*. J. B. Fisk, Brooklyn, N. Y. The Committee would make mention of these beautiful specimens, for the almost perfect resemblance they have to the natural flower; they display much ingenuity and skill.

No. 241. 1 *Framed Specimen of Needle Work*. Alfred N. Brewer.

No. 244. 1 *Framed Specimen of Penmanship*. F. W. Williams.

No. 255. 3 *Specimens of Bank Notes*. Casseloir, Durand & Co. The execution of these notes were in the well known good style of the engravers.

No. 257. 1 *Design of the Chapel of the N. Y. University, 1 do. of City Hall, Brooklyn*. A. J. Davis. These designs were in the best style of the artist, so well known as an architect in this city. The tone of shading and truth of perspective, were particularly admirable. The Silver Medal of the Institute.

No. 275. 2 *Shell Card Racks*. Miss Shipman. For exhibition.

No. 281. *A Basket and Box of Grecian Ornamental Glass*. Miss Minor. Thought by the Committee to be very neat, and creditable to the lady's taste and skill.

No. 283. 6 *Looking Glasses*. Ed. S. Hill, 130 Chatham street. The Glasses were excellent.

No. 288. 1 *Map and 3 Engravings*. Wm. J. Mullen, 175 Broadway. For exhibition.

No. 164. *Architectural Drawings*. John Mitchell. For exhibition.

No. 199. 2 *Specimens of Penmanship*. J. A. Lee, 18 Pine street. For exhibition.

MISCELLANEOUS.

No. 12. *Specimens of Tool Handles*. By N. Couenhoven. Considered good.

No. 17. *Miniature Ship*. Capt. Bissel, 368 Broadway, New-York City. A good model.

No. 18. 31 *Specimens of Pottery from the Salamander Works*. Deposited by M. Lefoulon, 62 Cannon street, New-York City. These are beautiful specimens, and the Committee feel justified in saying that they have seen nothing to equal them in this country. In articles of this kind, where competition is so successfully prosecuted with the foreign article, the special notice of the public is merited by the enterprising manufacturers. The Silver Medal and Diploma of the Institute.

No. 21. *Type Moulds*. Mr. Abbys. Highly finished, and apparently very good. The Diploma of the Institute.

No. 30. 1 *Rifle Walking Cane*. A. D. Cushing, Troy, N. Y. Considered a very ingenious and important instrument, and finished in the most workmanlike manner. The Silver Medal of the Institute.

No. 34. *Castor Frames, Lamps, Candelsticks, of Britannia Ware*. I. Weeks & Co. Poughkeepsie, N. Y. Very good and highly finished.

No. 45. *Cork Mattress, Spring do. and Cork Bag.* John L. Norwood, 240 Water street. The Committee consider them very good, and worthy of special notice from those who use such articles.

No. 54. 11 *Samples of Snuff.* B. L. & H. Joseph, 138 Front street, New-York City. Diploma of the Institute. The Committee consider the quality of these specimens very superior, and in this they were borne out by the olfactory evidence afforded by visitors.

No. 55. *Naval Bombshell—Patent.* Dr. Scudder, New-York City. Cast by Johnson & Geer, Troy, N. Y. and the spikes wrought by Burden & Knower, of Burden's Patent Spikes. This is eminently calculated to effect the destructive purposes for which it was designed.

No. 58. 1 *Beer Pump and Cask.* D. F. Sergeant, 40 Fulton street, Brooklyn N. Y. This is a self-supplying Double Power Pump, with little friction, and well suited to the purposes of Bar Rooms, Cisterns, &c. It is also well adapted for the uses of Wine, Cider, or Porter Bottlers, as it will empty casks without disturbing, in the least, the sediments therein.

No. 97. 2 *Printed Table Covers, and 1 Piano Cover.* Duncan & Cunningham. Considered of great beauty and firmness of texture. The Diploma of the Institute.

No. 100. 250 *Scripture Gems.* Colton & Jenkins. Considered very well executed.

No. 121. 8 *Specimens of Children's Clothing, viz. 4 Suits and 4 Trunks.* Mr. Durando, 60 Chatham street. Many of these were considered by the Committee very beautiful, and got up in fine taste. The Diploma of the Institute was awarded.

No. 75. 1 *Fancy Reel, for Winding Silk.* S. H. Platt, 128 Spring street, New-York City. Considered a very useful article.

No. 77. 2 *Boxes of Spermaceti Candles.* Samuel Judd. These were extremely beautiful, and not surpassed by any in the country. The Diploma of the Institute.

No. 76. 1 *Bed Quilt, of 3,180 pieces.* Lydia Todden. Considered a beautiful article, and the result of much labor.

No. 128. 1 *Pair Jacks.* 2 *do. Cards.* 1 *Machine Card,* 3 *Shuttles,* 1 *Cleaner,* 3 *Bobbins,* 1 *Side Lace Leather.* John Whittemore, 66 Frankfort street. The Cards and Shuttles were considered by the Committee of superior workmanship, and the *Lace Leather* as possessed of extraordinary merit, and think that it will come into great use.

No. 129. 6 *Pieces Mole Skin Buffalo Cloth.* Peter H. Schenck, 35 Pine street, New-York City. These were thought by the Committee superior articles, and highly meriting public attention. The Diploma of the Institute.

No. 131. 4 *Pieces Carpeting.* G. W. & G. Betts, 434 Pearl street, New-York City. All these specimens were considered good, but that of the Venetian

Carpeting was thought to be very heavy, and in pattern and workmanship particularly excellent. The Diploma of the Institute.

No. 155. 3 *Coffee Urns,* 1 *Egg Coder,* 1 *Tea Pot,* 1 *Water Dish and Cover.* James Grant, 315 Broadway, New-York City. These are considered by the Committee of superior workmanship; they therefore award to Mr. Grant the Diploma of the Institute.

No. 161. 1 *Pair Window Blinds.* Francis Baker, 366 Hudson street.

No. 168. 3 *Fishing Rods and 1 Reel.* John Conroy. Considered good articles.

No. 175. 1 *Pair Ottomans,* 1 *Foot Stool,* 1 *Lamp Mats,* &c. &c. Mrs. Shultz, 45 Lispenard street. Some of these specimens were considered by the Committee extremely beautiful, and highly creditable to the lady who wrought them. The Diploma of the Institute.

No. 181. 4 *Port Folios, or Manifold Writers.* James Gilchrist, 102 Broadway, New-York City. The utility of this contrivance for copying Letters, &c. the Committee think to be generally known. The Diploma of the Institute.

No. 174. 1 *Brass Trip, or Counter Scale.* W. H. & S. Nichols. Remarkable for its convenience.

No. 115. 3 *Trusses and Case.* Dr. A. G. Hull, 132 Fulton street. The Committee think this instrument admirably adapted for the purposes described; they award the Diploma of the Institute.

No. 186. 3 *Pairs Mantle Lamps,* 2 *Stand do. and 1 Astral do.* Samuel Wignall. These were beautiful patterns, and very richly ornamented with cut glass. The Committee awarded the Diploma of the Institute.

No. 198. 1 *Travelling Trunk.* Orlando Williams, 6 Norfolk street. Considered the best specimen offered, and of excellent workmanship. The Diploma of the Institute.

No. 203. 2 *Lamp Stands and Case.* Mrs. Whatmough. These specimens for competition were considered deserving the Diploma of the Institute.

No. 208. 1 *Frame of Castings.* Jones Kiem & Co. The Committee thought these very good, and meriting the Diploma of the Institute.

No. 229. 1 *Patent Coffee Roaster.* G. H. Clark, 4 Fletcher street. This was thought to be very convenient and durable, wherefore the Committee awarded the Diploma of the Institute.

No. 234. 1 *Cherry Stone, containing 24 dozen Silver Tea Spoons.* Charles Smith. This exhibited great skill and ingenuity.

No. 264. 1 *Speaking Trumpet.* Colin Lightbody. Considered very well made, and entitled to the Institute's Diploma.

No. 266. *Apparatus for Injecting the Veins.* Dr. J. Mauran. This is for injecting liquids into the veins, and is an appendage adapted to a self-injecting apparatus. It consists of a glass bulb with tubes fitted with screws, so as to be attached to Mob's self-injecting instrument, and so constructed as to prevent the possibility of the passage of air into the veins. The

Committee think the instrument superior to every other for the purpose, and therefore award to the inventor the Silver Medal of the Institute.

No. 267. *Dahlia Flowers.* William Prince & Sons. The Committee are under special obligations to Mr. Prince for the splendid flowers which he sent to grace the exhibition hall of the Institute.

No. 291. 2 *Specimens of Fire Works.* Reuben Rider. The Committee thought the pieces very good, and they were much admired by the large company of spectators at the closing of the exhibition at Castle Garden, when Mr. R. made a very brilliant display of the pyrotechnic art. He was awarded the Diploma of the Institute.

No. 280. 1 *Fancy Musket.* John Mullen, 187 1-2 Greenwich street, N. Y. The Committee think this made in the neatest and most workmanlike manner. They award the Diploma of the Institute.

No. 285. *Specimens of Sealing Wax.* Lewis & Co. The Committee consider this the best article they have ever seen of the kind, foreign or domestic. The fancy colored wax in this large collection, does credit to the manufacturers and should, with all the kinds here exhibited, receive the attention of the public. They award the Diploma of the Institute.

No. 72. 1 *Waggon.* Walters, Barre & Co. Brooklyn, N. Y. A fine specimen of workmanship.

No. 105. *Samples of Mustard.* J. Cogswell, 77 Canal street. For exhibition.

No. 180. *Model of Patent Metal Roofing.* John Woolley. For exhibition.

No. 170. 1 *Tin Trunk.* L. Lester, 213 Water street, New-York City. This was a new and ingeniously made article, and one which the Committee particularly noticed.

No. 85. *Pen and Ink Drawing, 1 Etching, 1 Engraving of Ornamental Iron Work and 1 Frame of Cards.* W. M. Thompson, 167 William street, New-York City. For exhibition.

No. 188. 1 *Ship in Case.* Wm. Searle. For exhibition.

No. 218. 1 *Churn.* Justin Ware.

No. 235. 1 *Miniature Rail Road and Clock.* W. S. Jacks. This was an ingenious piece of work, and was in operation during the Fair, to the delight of the visitors. For exhibition.

No. 247. 1 *Bed Quilt.* L. R. Sweetland. For exhibition.

No. 249. 1 *Bottle, with Reel of Silk.* For exhibition.

No. 263. 1 *Glass Hive.* Mr. Kelsey. For exhibition.

No. 270. *Map of the United States.* James McChesney. For exhibition.

No. 278. 1 *Door Weight.* Dr. Davidson. For exhibition.

No. 24. *Sea-Horse Hide.* Remarkable for thickness.

No. 260. 1 *Framed Oil Painting.* D. Avigney, 183 Broadway. This specimen had no inconsiderable merit.

No. 230. 1 *Large Tabular Plate, and 16 Lights of Glass.* New-York and Brooklyn Crown Glass Company. The

Company was incorporated in 1832; capital \$60,000; employs 50 hands, and produces 10,000 feet of Glass weekly; their Factory is in Brooklyn, near the Navy Yard. The quality of this Glass was considered by the Committee most excellent. The Plate was of great dimensions, with equal clearness and uniformity in thickness. The Diploma of the Institute.

STOVES.

No. 282. 1 *Summer Cooking Stove*. Charles Vale, Newark, N. J. This was a superior article, and adds to the reputation of Mr. Vale, as a manufacturer of Stoves.

No. 47. Sent for exhibition.

No. 13. 1 *Parlor and 1 Cooking Stove*. Sylvester Parker, Troy, N. Y. Beautiful and convenient articles. The Diploma of the Institute.

No. 27. 1 *Cooking Stove*. Seth Lowe & Co. Made by Mr. Town, Salem, Mass.

No. 56. 1 *Cooking Stove—of Sheet Iron*. Charles Vale, Newark, N. J. Considered a most ingenious arrangement for domestic purposes, whilst it is admirably adapted for an economical appropriation of heat. The Silver Medal of the Institute.

No. 101. 1 *Stove*. James Hinds, 200 Canal street, New-York City. The Committee consider this a very handsome article. The Diploma of the Institute.

No. 122. 3 *Coal Cooking Stoves*. Joel Curtiss, 222 Greenwich street. Considered very neat and useful articles. The Diploma of the Institute.

No. 166. 3 *Cooking Stoves, 1 Fancy and 1 Parlor do*. Jordan L. Mott, 248 Water street. The Committee consider the two last mentioned stoves novel and useful.

No. 185. 2 *Rotary Stoves and Fixtures*. M. N. Stanley & Co. The ingenuity displayed in the structure of these, and their utility, entitle them to the Diploma of the Institute.

No. 139. 2 *Cooking Stoves, 1 Globe do*. Doyle & Patterson, 213 Water street. For exhibition.

No. 146. 1 *Coal Cooking Stove, 1 do for Heat*. S. C. Lawrence, 125 Broadway, New-York City. For exhibition.

No. 27. 1 *Cooking Stove*. Seth Lowe & Co. 211 Pearl street. Wm. Town, maker, Salem, Mass.

No. 66. *Doric Fireplace and Minerva Grate*. Wm. Mallory, Agent. The Committee highly approve of these articles, both for their model and workmanship, combining, as they do, great neatness and utility: the Grate is admirably adapted for the burning of anthracite coal. The Committee award the Silver Medal of the Institute.

No. 79. *Spoor's Patent Coal Stove and Scuttle*. J. F. Clarkson, 51 Fulton street, New-York City. Considered very good and very neat. For the Stove the Committee award the Diploma of the Institute.

APPRENTICES' WORK.

No. 4. *Two Mantle Lamps*. Made by James McGovern, New-York City, an apprentice one year. Considered very good. Privileges of the Institute.

No. 5. *Two Astral Lamps*. William Moore. Considered very good.

No. 11. 2 *Pictures*. George Heister, aged 15.

No. 14. 1 *Cask*. George Thompson, aged 18 years—1 year an apprentice—56 Goerck street, New-York City. Deserving great praise. Silver Medal and Privileges of the Institute.

No. 28. 1 *Iron-bound Cask*. James Flinn, an apprentice, 19 years old, 3 years at trade. Diploma and Privileges of the Institute.

No. 39. *Frame of Cards*. By James Everdell, 135 William street, N. Y. C., a boy aged 15 years. The Silver Medal and the Privileges of the Institute.

No. 50. 1 *Iron-bound Barrel*. James Thomas, an apprentice; 2 years at trade. Privileges of the Institute.

No. 51. *Gentlemen's French Boot Lasts*. Those in Box No. 3 were made by a boy 14 years old, to whom the Committee award the Privileges of the Institute.

No. 85. 1 *Case of Jewelry*. George Street, an apprentice, 18 years of age, 3½ at trade. The Diploma and Privileges of the Institute.

No. 90. 1 *Case of Surgical Instruments*. James Turkington, 51 Clinton street; an apprentice, 18 years old. The Silver Medal, and the Privileges of the Institute. The Committee are of the opinion that the case of Surgical Instruments, here presented, exhibits talents and zeal in the maker worthy of being stimulated to further exertions, and that these specimens of his workmanship are of surpassing elegance and finish.

No. 136. 1 *Silk Hat*. James Patterson, 94 Canal street—1 year an apprentice with Mr. John Wright. Considered, from the short experience of the maker, an uncommon evidence of skill.

No. 137. 1 *Clock Stand, and 1 Marble Ink do*. Wm. Patterson, 33 Canal street, 3½ years an apprentice to Mr. Barnes. Considered excellent work. The Privileges of the Institute.

No. 150. 1 *Leather Travelling Trunk*. Geo. Dupignac, 28 Hester street, nine months an apprentice to O. Williams. The Committee take pleasure in noticing the early efforts of apprentices, and this specimen is one among those to which their attention has been called. The Privileges of the Institute.

No. 78. 2 *Tables*. Joseph Fisher, 15 years old; an apprentice 1½ years. The Diploma and Privileges of the Institute. These specimens certainly gave great promise of talent in the young mechanic, and were duly appreciated by the Committee.

No. 155. To Wm. Taylor, an apprentice, 19 years of age, manufacturer of a *Coffee Urn*, the Committee award the Privileges of the Institute.

No. 240. 3 *Carpenter's Ploughs, and 7 Spare Irons*. Isaac Battie, Providence, R. I., 18 years old, apprentice 3 years to J. R. Gale. The superiority of workmanship displayed by this young man, in the make of these articles, entitles him, in the opinion of the Committee, to the Silver Medal of the Institute.

No. 53. 5 *Ladies' Straight Lasts*. R. Coit, a lad 16 years of age; 1 year at the trade. The Privileges of the Institute.

No. 87. 1 *Carved Ionic Cap*. Samuel Smith, aged 16 years. Well executed.

No. 152. 1 *Engraving of McDonald Clarke*. Lewis P. Clover, aged 16, first attempt, 6 months at trade. Considered an evidence of uncommon merit in his business, and therefore worthy of the Diploma and Privileges of the Institute.

No. 84. *Machine for Corking Bottles*, made by Augustus Williams, an apprentice, deposited by F. Groening. Privileges of the Institute were awarded to the apprentice for the workmanship, which was excellent.

No. 91. 3 *Pairs Pocket Compasses*. By Gerrett Barney, 16 years of age. Apprentice to Brown & Hunt. These have much merit. A Diploma, together with the Privileges of the Institute, have been awarded to the apprentice.

During the evening which closed the Fair of the Institute, Dr. Gale made several brilliant and interesting experiments, with the Institute's powerful Galvanic Battery. The combustion of Charcoal, and Platinum, displayed an intensity of action, power of heat, and vividness of light, which astonished the numerous auditors. The light was altogether too dazzling for the sight, and could be viewed only a few moments at a time. The combustion of metals in water was not the least interesting to the ladies and gentlemen present, who repeatedly manifested their surprise and gratification, during the performances, by loud and cheering applause.

The novel exhibition of *Walking upon the Water* was also presented from the Garden to thousands of our citizens during the Fair of the Institute. Mr. Macintosh, the successful experimenter, entered the water near the Battery, and walked a considerable time in the North River, sustaining himself in an upright position, and moving with much apparent ease, though the surface of the water was agitated by rough and high waves. This experiment satisfactorily proves the importance of the simple apparatus used on the occasion, for fording rivers, and for preservation against accident.

LAW OF MARINE INSURANCE AND PILOTAGE.—The report of an interesting case, in which the question between the insurers and the insured, turned on the point, of whether the master of the vessel had not improperly hazarded his ship, by standing on too long without a pilot, will be found in our columns to-day.

The Chicago American states that the Prairies were burning in all directions, during the first part of last week. The flames had approached to within a short distance of that village. No other damage had been sustained, but the burning of a number of haystacks.

## LINES.

Written after seeing the *Plates of Audubon's Birds of America*.  
"Painting is silent music," as said one

## TO TUNNEL CONTRACTORS.

Proposals will be received by mail, or otherwise, for excavating a Tunnel on the summit of the Handy and Beaver Canal. The Tunnel is 900 yards long, the material to be removed is a soft sand-stone rock, the highest part of the ridge through which it passes is about 60 feet above the top of the Tunnel. As the deep cuts at the termination are not excavated, most of the material will have to be removed through shafts. Proposals must be accompanied with good recommendations, as to skill and competency.  
E. H. GILL,  
Engineer.

New-Lisbon, Ohio, Sept. 17, 1883.

## TO TUNNEL MINERS, DRILLERS, &amp;c.

Wanted, immediately, 40 Tunnel Miners, (Cornish MI men will be preferred), 80 Drillers, 30 Laborers, and two experienced Mine Blacksmiths, on the New York and Harlem Railroad, about five miles from the City. Liberal wages will be given, and cash payments made every fortnight. Apply at Mr. FOWLER'S, St. John's Hall, Frankfort street, New-York.

JOHN BUTTER, Contractor  
337 The Albany Argus, Philadelphia U. S. Gazette and Pennsylvania, will please copy this, and send their bills to the Railroad Company, 14 Wall street, New-York. 23-17

## NEW-ORLEANS AND NASHVILLE RAILROAD.

## NOTICE TO CONTRACTORS.

The New-Orleans and Nashville Railroad Company having decided to place under contract the first fifty miles of the Road, on the 15th day of December next, Proposals will be received at their Office, in the City of New-Orleans, from the 15th of November to the 15th day of December next, for the Graduation and Bridging of the same. The Superintendent Engineer, R. S. Smith, will be upon the ground to give every explanation relative to the manner of making Proposals, and such other information as may be required.

Of persons not personally known to the Engineer, there will be required certificates of character and qualifications. This part of the road, extending along the shore of Lake Pontchartrain, is perfectly healthy throughout, and being the commencement of the most extensive work in the world, it cannot fail to be of great importance to Contractors to identify themselves with the work at its commencement, as those who are known to the Company as responsible and efficient will certainly be preferred to strangers during the future progress of the road.

The country through which the line passes is generally high plain ridge, and perfectly healthy.

H. J. HANNEY,

Chief Engineer N. O. & N. Railroad. ]  
Engineer Office, N. O. & N. Railroad, )

## RAILROAD IRON.

200 tons of Railroad Iron of the T pattern, just imported and for sale by  
HOWLAND & ASPINWALL,  
35 South street.

## RAILWAY IRON.

305 tons of 1 inch by 4 inch, Flat Bars in lengths of  
300 do. 1 1/2 do. do. 14 to 18 feet, corner work  
40 do. 1 1/2 do. do. holes, end cut at an angle  
200 do. 2 do. do. of 45 degrees, with splicing  
200 do. 2 do. do. plates and rails to  
soon expected.

250 do. of Edge Rails of 36 lbs. per yard, with the requisite chairs, keys and pins.

Wrought Iron Rims of 30, 33, and 36 inches diameter for Wheels of Railway Cars, and of 60 inches diameter for Locomotive wheels.

Axles of 2 1/2, 3, 3 1/2, 4, and 5 inches diameter for Railway Cars and Locomotives of various iron.

The above will be sold free of duty, to State Governments and incorporated Governments, and the Drawback taken in part payment.

A. O. KALSTON,  
3 South Front street, Philadelphia.

Models and samples of all the different kinds of Rails, Chairs, Pins, Wedges, Spikes, and Splicing Plates, in use both in this country and Great Britain, will be exhibited to those disposed to examine them. 471mewr

## PARTNER WANTED.

Wanted, a partner in an extensive Printing Establishment. No one need apply who is not a thoroughbred printer, competent to superintend and direct an office in which upwards of 30 persons are employed, and able to furnish \$3000 cash capital. The best of references will be given and required. Letters, with real name, may be addressed to P. P. P., Post Office, New-York, postage paid, and they will be promptly attended to. May-17

## RAILROAD CASTINGS.

MANY & WARD, Proprietors of the Albany Eagle Air Furnace and Machine Shop, will make to order car wheels, chairs and knees, and every other description of castings required for railroads. B-17 table

## STEPHENSON.

Builder of a superior style of Passenger Cars for Railroads.

No. 224 Elizabeth street, near Blackwell street, New-York.

IF RAILROAD COMPANIES would do well to examine these Cars; a specimen of which may be seen on that part of the New-York and Harlem Railroad now in operation. 345 U

## RAILROAD CAR WHEELS AND BOXES AND OTHER RAILROAD CASTINGS.

Also, AXLES furnished and fitted to wheels complete at the Jefferson Cohen and Wool Machine Factory and Foundry, Paterson, N. J. All orders addressed to the subscribers at Paterson, or 25 Wall street, New-York, will be promptly attended to.

Also, CAR SPRINGES  
Also, Flange Three turned complete.

JOHN RUGGERS, KETCHUM & GROSVENOR  
PATENT RAILROAD, SHIP AND BOAT SPIKES.

IF The Troy Iron and Nail Factory keeps constantly for sale every extensive assortment of Wrought Spikes and Nails, from 2 to 18 inches, manufactured by the subscriber's Patent Machinery, which after five years successful operation and now almost universal use in the United States (as well as England, where the subscriber obtained a Patent), are found superior to any ever offered in market.

Railroad Companies may be supplied with Spikes having countersink heads suitable to the holes in iron rails, to any amount and on short notice. Almost all the Railroads now in progress in the United States are furnished with Spikes made at the above named factory—for which purpose they are found invaluable, as their adhesion is more than double any common spikes made by the hammer.

IF All orders directed to the Agent, Troy, N. Y., will be punctually attended to.

HENRY BURDEN, Agent.

Troy, N. Y. July, 1881.

IF Spikes are kept for sale, at factory prices, by J. A. J. Townsend, Albany, and the principal Iron Merchants in Albany and Troy; J. I. Brower, 223 Water street, New-York; A. M. Jones, Philadelphia; T. Janviers, Baltimore; Degrad & Smith, Boston.

F. S.—Railroad Companies would do well to forward their orders as early as practicable, as the subscriber is desirous of extending the manufacturing as to keep pace with the daily increasing demand for his Spikes. 112mewr H. BURDEN.

## SURVEYING AND ENGINEERING INSTRUMENTS.

IF The subscriber manufactures all kinds of Instruments in his profession, warranted equal, if not superior, in principles of construction and workmanship to any imported or manufactured in the United States, several of which are entirely new, among which are an Improved Compass, with a Telescope attached, by which angles can be taken with or without the use of the needle, with perfect accuracy—also a Railroad Goniometer, with two Telescopes—and a Levelling Instrument, with a Goniometer attached, particularly adapted to Railroad purposes.

WM. J. YOUNG,

Mathematical Instrument Maker,

No. 9 Dock st., Philadelphia.

The following recommendations are respectfully submitted to Engineers, Surveyors, and others interested. Baltimore, 1882.

In reply to the inquiries respecting the instruments manufactured by them, now in use on the Baltimore and Ohio Railroad, I cheerfully furnish the following information. The whole number of Levels now in possession of the department of construction of the Baltimore and Ohio Railroad is eight. These are all exclusive of the number in the service of the Engineer and Graduation Departments.

Both Levels and Compasses are in good repair. They have in fact needed but little repairs, except from accidents to which all instruments of the kind are liable.

I have found that the patterns for the levels and compasses have been preferred by my assistants generally, to any others in use, and the Improved Compass is superior to any other description of Goniometer that we have yet tried in laying the rails on this Road.

This instrument, more recently improved with a revolving telescope, in place of the vane sights, leaves the engineer scarcely any thing to desire in the formation or convenience of the Compass. It is indeed the most complete and adapted to lateral angles of any simple and cheap instrument that I have yet seen, and I cannot but believe it will be preferred to all others now in use for laying of rails—and in fact, when known, I think it will be as highly appreciated for common surveying.

Respectfully thy friend,  
JAMES F. STABLEY, Sup't of Construction of Baltimore and Ohio Railroad, Philadelphia, February, 1882.

Having for the last two years made constant use of Mr. Young's "Patent Improved Compass," I can safely say I believe it to be much superior to any other instrument of the kind, now in use, and as such most cheerfully recommend it to Engineers and Surveyors.

E. H. GILL, Civil Engineer.  
Germantown, February, 1882.

For a year past I have used Instruments made by Mr. W. J. Young, of Philadelphia, in which he has combined the properties of a Theodolite with the common Level.

I consider these Instruments admirably calculated for laying out Railroads, and can recommend them to the notice of Engineers as preferable to any others for that purpose.

HENRY R. CAMPBELL, Eng. Philad.  
at 17 Germantown and Norris, Railroad

## JAMES RIVER AND KANAWHA CANAL, VIRGINIA.

## NOTICE TO CONTRACTORS.

THE Board of Directors of the James River and Kanawha Company, having resolved to place under contract seventy-three miles of the line of their improvement, viz.: All that part extending from the water works dam at Lynchburg, to the end of section No. 118, in the village of Scottsville, and the thirteen miles between the Seven-Island Falls, and the village of Columbia—

Sealed proposals will be received by the Secretary of the Company, at their office in the city of Richmond, from November 18th, to December 7th, inclusive, for all the excavations, embankment and walling in that distance.

The portion of the line which it is intended to let, comprises many difficult points, and a considerable amount of river walling and blasting.

The line will be prepared for examination by the 15th of November; after which date, up to the time of letting, all useful information will be given, and the maps and profiles exhibited to contractors, on application being made to either of the Principal Assistant Engineers, Simon W. Wright, in the village of Cartersville, Daniel Livermore, a Scottsville, and Charles Elliot, Jr., in the town of Lynchburg.

It is expected that the proposals of contractors who are not personally known to either of the Assistant Engineers, will be accompanied by proper testimonials of character and experience, from the Engineers of other works on which they have been engaged.

The award of the proposals will be broken on the 10th of December, and the acceptance of the proposition by the Board, made known as soon after, as will be practicable. By order of the President and Directors

W. B. CHITTENDEN, Secretary.

Note—This advertisement is not intended to embrace the Locks, Dams, Culverts, or any other of the works of art—Prior to the letting of which, as well as of the residue of the excavation and embankment between Scottsville and William's Adventure, due notice will be given. 44-17D

## ENGINEER DEPARTMENT, BALTIMORE AND SUSQUEHANNA RAILROAD COMPANY.

October 19, 1883.

To Contractors.—Proposals will be received between the 18th and 25th of November next, for the Graduation and Masonry on 25 miles of this Road.

ISAAC TRIMBLE,

Engineer B. & O. R. R. Co.

WILLIAM GIBBS McNEILL,

Consulting Engineer.

## ENGINEER DEPARTMENT, WRIGHTSVILLE AND YORK RAILROAD COMPANY.

October 19, 1883.

To Contractors.—Proposals will be received in York, Penn., between the 18th and 25th of November next, for the Graduation and Masonry, of the whole line of Road.

ISAAC TRIMBLE,

Engineer W. & Y. R. R. Co.

WILLIAM GIBBS McNEILL,

Consulting Engineer.

On 31.—2c.

## STEAM ENGINE WANTED.

A good, second hand, Steam Engine, of 10 or 12 horse power, is wanted for a boat to be used on the Canal. Any gentleman having an engine suitable for that purpose, which he can sell cheap, may address a note to, or call upon, the Editor of this Journal, who is desired to make inquiry, and to communicate the result to the advertiser.

## AMERICAN RAILROAD JOURNAL.

NEW-YORK, NOVEMBER 21, 1835.

### NORWICH AND WORCESTER RAILROAD.—

It is now over three years since the Legislature of Connecticut chartered a Company to construct a Railroad from Norwich to the Massachusetts line, in the direction of Worcester, with a view of opening another easy and direct communication between New-York and Boston. In March, 1833, the Legislature of Massachusetts chartered a Company to construct a Road from Worcester, to meet the Norwich Road, by which the line, between the metropolis of New-England and the growing city of Norwich, is complete.

Since these charters were granted, examinations and surveys have been made which show a highly favorable route; and the immense amount of business along its line, which must pass over it, together with that portion of the travel from New-York, and the interior of New-England, which will naturally take this direction, will, it is believed, afford an amount of transportation which will render it, not only a very useful work, but also a productive investment to its stockholders. That such will be the result, and that it will greatly enhance the value of property along its line, we do not entertain a doubt; Norwich, especially, will feel its influences, and participate largely in the benefits resulting from its operations.

The commencement of such a work, den-

tined, as we believe this is, to change the appearance of the whole country along its line, is worthy of especial notice; and we therefore availed ourselves of an invitation, politely tendered by the President of the Company, to witness the interesting ceremony of breaking ground. In order to do this, we left New-York on Tuesday evening, 17th, at 4 o'clock, in that excellent steamboat, *Bunker Hill*, Capt. Sandford, for Norwich, where we arrived at half-past 8 o'clock on Wednesday morning, having remained at New-London from a quarter before 2 until half-past 6 A. M., in time to witness the whole of the proceedings. On her passage, the *Bunker Hill* stopped at New-Haven, and received on board His Excellency Governor Edwards, and suite; Mr. Ellis, Collector of the Port; Mr. Brewster, President of the New-Haven Railroad Company, and several other distinguished citizens, all of whom participated in the gratifying ceremonies.

We will now endeavor to give our readers some account of the proceedings, although we cannot expect to impart to them any portion of the thrilling interest which they afforded us; it being, singular as it may appear, the first opportunity, of which we have been able to avail ourselves, to be present at the commencement of a Railroad.

On the arrival of the *Bunker Hill* at Norwich, the Governor and suite, and other invited guests, were received at the boat by Messrs. Adams, and L'Homedieu, two of the Marshals of the day, and escorted to the Franklin Hotel. After remaining here a short time, affording an opportunity to some of the citizens of being introduced to the Governor, they were conducted to the Merchants' Hotel, and there joined the procession, which moved at 11 o'clock towards Greenville, (where the ceremonies were to be performed,) under the direction of ASA CHILD, Esq., Grand Marshal of the day. The uniform companies, accompanied with music, took the lead; next the Governor and suite; the Reverend Clergy; revolutionary

soldiers; the Corporation of Norwich and New-London; invited guests; and citizens generally; followed by a procession of several hundred boys, belonging to the schools, with banners; forming one of the most interesting spectacles of the whole exhibition. The procession was closed by an immense CAR, drawn by six horses, on which was displayed samples of the numerous manufactures on the line of the Road. Among the articles, we noticed the following: ingrain carpeting and rugs, domestic goods, blank books, earthen, tin, wooden, and hardware, carriages, boats, cordage, ship blocks, saddles, trunks, cutlery, weaver's reeds, brooms, stoves, harness leather, scythes, axes, glass beads, &c. &c.

The procession passed through the principal streets of Norwich, the windows and doors of the houses on each side being occupied by the ladies, neatly and appropriately dressed; and adding quite an agreeable feature to the scene. On leaving the town, the line of march extended along the banks of the Quinnebaug, from the heights of which minute guns were fired until the procession reached Greenville. The ground selected for operations is near the centre village, and directly in front, of the splendid manufactories of Greenville. As the procession approached the ground selected, it passed under a beautifully decorated arch, on which was again displayed numerous and beautiful specimens of the products of Yankee industry.

The ground selected was staked out, and on the south side an immense staging was erected, with ranges of seats rising one above another, covered with ample awnings, beneath which, upon the staging, were near a thousand ladies seated, who appeared highly pleased with the display. The military were formed into three sides of an immense hollow square, the ladies on the staging forming the fourth—the procession marched in and entirely occupied the square, except a space reserved for the ceremonies of the day.

The procession having been arranged, and the invited guests stationed near the platform—the President of the Company, Wm. C. GILLMAN, Esq., in a few appropriate remarks, alluding to the ancient usages of the Pilgrims of commencing all enterprises, either of danger or magnitude, with prayer, introduced the Rev. and venerable Dr. NORR—whose snow white locks indicated an intimate personal acquaintance with nearly one half the entire history of Connecticut—who addressed the Throne of Grace in a short, but exceedingly appropriate prayer—after which CALVIN GODDARD, Esq., of Norwich, was called upon, and made a few remarks. He was not unaffected, he said, by the disappointment in not hearing an address from a gentleman who was expected to be present, but who was unavoidably prevented from attending. [The speaker alluded to the Hon. DANIEL WEBSTER.] He then remarked that they had assembled on no common occasion; every thing had hitherto been auspicious, and judging from the past, he had no fears for the result of the enterprise in which they were that day engaged. He adverted to an allusion of the Reverend gentleman to their present situation and that of their Pilgrim fathers. It is an interesting historical fact, said he, that two hundred years ago, last Monday, the Pilgrims passed through this county from Massachusetts Bay, having travelled through dense forests, and been fourteen days in performing the journey. It was indeed remarkable, that they should now be engaged in a work, which, whenever completed, would enable us to accomplish the same distance in one half as many hours. There was something peculiar and interesting in these facts. Mr. Goddard next alluded to the scenes of warfare with the then owners of the soil, the savages—to the death of MIAHTINOMO—who, he said, was killed by Uncas, and buried but a short distance from where they then were—to the brave UNCAS, the friend of the white man—asking, very appropriately, where are those brave warriors? Where are their people? *Dispersed, degraded, and destroyed*,—they have disappeared before the progress of civilization. He also alluded to the fact that it was in this town where the brave MASON fell, and that they were surrounded by interesting incidents of former times. What is our present condition? Compare it with all its advantages and impulses, and what will it or rather what will it not be two centuries hence?

He then referred to a single fact in the government of Connecticut, which was worthy of record—the formation of the government by the people themselves, in their primary assemblies. This was a peculiarity which belonged to no other State.—“We have,” said he, “always been under a government of the people.”

In alluding to the want of energy and progress heretofore, in the works of inter-

nal improvement in Connecticut, Mr. G. observed, that Connecticut had furnished the men, the material, to accomplish such works in most of the other states of the Union, and therefore Connecticut had been permitted to remain in a great measure unimproved—but that now, fortunately for her, a different spirit prevails. The sons of Connecticut, and indeed of all New-England, are engaging in, and are resolved to devote themselves to, the improvement of their own States; the land of their birth—a course which will unquestionably tend more than any other, to detain them at home; and of course to make their native land literally the Garden of America; interspersed with avenues to market, by which their products may be transported rapidly, cheaply and safely—affording rich and ample rewards for their capital, which, as he observed, consists mainly in their unsurpassed industry and enterprise.

Mr. G. said he could not but advert to the rapid growth of Ohio, whose admission into the Union he well recollected, with a population of less than sixty thousand; but on a visit there within a few years, he found her with more than a million of hardy, industrious inhabitants, who were pushing, with great spirit, their works of internal improvement. Why then should Connecticut, whose history is of two centuries, delay to pursue the same path?

She would not, he was confident, longer delay—and with this spirit of liberal forecast and mutual concession and assistance, she will go forward until every part of the State participates in the benefits of Internal Improvements.

After a short and pertinent address from Col. JUDSON, Member of Congress elect, the President of the Company introduced his Excellency the Governor, and thus addressed him:

I beg leave, Sir, to return you thanks, in behalf of myself and the Directors of this Company, for your presence on this occasion; and permit me to present you with this implement (a pick-axe) with which you are desired to strike the first blow, as a commencement of the work in which we are now engaged, and that we may have an evidence that you are favorably disposed towards it, and also as a token that you will hereafter lend it all the aid in your power.

Gov. Edwards then addressed the company. He said it was the second occasion upon which he had been called upon to perform a similar duty. It was with no small degree of pleasure that he undertook the first, and he felt equal pleasure on the present. On the former occasion he had remarked that it was the first Railroad ever commenced in the State of Connecticut, but he indulged the pleasing expectation of soon seeing them intersect every part of the State; from present indications, those expectations will speedily be realized. In taking a retrospect of past times the mind is filled with astonishment. He had re-

cently attended a celebration at Hartford of the first settlement of the country. It is two hundred years since Uncas lived. Where is he now? Where are his kindred? Where are they? They are gone, and almost forgotten, and in a very short time the sun will not shine upon the red man within our State. These effects are the results of the laws of nature.

He then drew a comparison between ancient and modern times, and gave the advantage to the latter, for which they were indebted to the art of printing, and the invention of steamboats and Railroads; which had changed the face of the world, not only morally and politically, but physically. It was almost impossible to define the influence of Railroads, Canals, and steamboats; but the period was not far distant when we should have, if not our Londons, at least our Liverpools, and Bristols, our Manchesters and Birmingham. These were pleasing anticipations, which would soon be realized, astonishing as they were to ourselves and to the whole world.

The Governor concluded by saying that he did not attend there for the purpose of making a long and elaborate harangue; but to break ground. He would now proceed to perform that duty with the utmost cheerfulness, as his whole heart and soul were in the undertaking.

The President of the Company now stepped forward, and expressed his regret that many of the distinguished individuals who had been invited to attend, had been prevented by other avocations from being present. Among these were Governor MARCY and Chancellor Kent, of New York; Mr. Hale, member of Congress from New London; the late Gov. LINCOLN, Hon. DANIEL WEBSTER, and His Excellency Edw. EVERETT, Governor-elect of Massachusetts. He read extracts from the letters of these gentlemen, all of whom regretted being unable to attend, and expressed their best wishes for the success of the work.

The Governor then (half past one) stepped forward with the pick-axe, and commenced breaking ground, which was shovelled into wheelbarrows, by the President and Directors, and wheeled away by the Mayors of Norwich and New London, and John BREED, Esq. The Presidents of other Railroads, the corporate authorities of Norwich and New London, and the other invited guests, were then requested to steping been done, the tools and barrows were collected by the Directors, and formally handed over to the Engineers, Messrs. KIRKWOOD and LAURIE, by the President, who, in a few words, reminded them of the importance and responsibility of their duties, and that the Company would look to forward and lend their aid, which have them for the faithful performance of their duties, and the proper construction of the Road.

The procession was then formed again in the same order, and returned to Norwich,

much pleased with the ceremonies, the performance of which were rendered more gratifying in consequence of the splendor of the day, and the perfect harmony which prevailed.

On our return to the Franklin House, we found prepared an excellent dinner, of which we partook, in company with a few Ladies and Gentlemen of Norwich and the neighboring towns, who, in common with ourselves, appeared to take as much pleasure in the *products*, as in the prospects, of New England; and it was not at all surprising, after a march of four miles, that most of us handled the implements of the table with quite as much earnestness as we had done those in the field.

On leaving the table at half past 3, P. M.—an hour earlier, perhaps, than we should willingly have assented to, but for the necessity of leaving for New York in the boat at 4 o'clock—we parted reluctantly with those from whom we had received, in so short a period, many tokens of respect and kindness.

We left them with feelings of deep interest, not only in the success of the work, in the commencement of which we had participated; but also in the prosperity and happiness of those by whom we had been so cordially received, and so politely treated; and we cannot therefore take leave of the subject without thus publicly expressing our thanks, and at the same time our confident belief that the friends of the *Norwich and Worcester Railroad* will realize their most sanguine anticipations of its utility and value.

The following are the officers of the *Norwich and Worcester Railroad* :—

WM. C. GILMAN, President.

Directors.

WM. P. GANER, JOHN BROWN,  
WM. C. GILMAN, ASA CHILDS,  
JOHN A. ROCKWELL, THOMAS ROBINSON,  
ARTHUR F. GILMAN, E. J. ANDERSON,  
CHAS. W. ROCKWELL, ABRAHAM FARRER,  
DANIEL W. COIT, G. P. PERKINS.  
JOSEPH RIPLEY,

Engineers.

JAMES P. KIRKWOOD, JAMES LAURIE.

#### IMPORTANT TO RAILROAD COMPANIES.—

The following letter is from a gentleman in London, on whose opinion we place much reliance, and especially so in relation to the subject on which he now writes to us.

"It cannot, in the nature of things, be other-wise than that *Railroad Iron* must advance in price, as the number of Roads under construction increases; and it therefore follows, that those Companies that intend to use iron next season, will do well to give their orders early; and it would seem to us that, where other business does not require the sending of an agent to Europe, a better agent could not be employed than Mr. Ralston, who writes this letter, or his brother,

Mr. A. Ralston, of Philadelphia, who is connected with him in business.

London, October 9, 1835.

To the Editor of the *Am. Railroad Journal* :

Dear Sir,—I beg your acceptance of the inclosed papers, on the subject of Railways projected in this country. The evidence of several eminent Engineers, given before a Committee of the House of Lords, contains information of the greatest value on the subject of the gradients on a Railway, and I think your readers will be grateful to you for publishing it in your excellent *Railroad Journal*. As your readers are much interested in Railway Iron, I will communicate the most recent information on the subject of common iron, the demand for which, of course, regulates the price of the other. On the 25th August last, the iron masters of Wales had a meeting at Cardiff, and ascertained, from mutual inquiries, that there had been a diminution of the stock of iron, (Welch only,) since the commencement of this year up to that time, of the large quantity of 45,000 tons, notwithstanding the manufacture was going on more extensively than usual. This fact induced them to advance the price of No. 2, bars, from £5 : 10 per ton to £6 per ton. Since then orders have come in on the most extensive scale, and, on the 9th September, ult., they were induced to advance the price to £6 : 10 per ton; and again, on the 30th September, ult., they announced a further rise of 10 shillings per ton, making £7 per ton free on board at Cardiff and Newport. The Staffordshire, Shropshire, and other midland county iron masters, have advanced in an equal proportion. Some of the largest iron masters have recently informed me, that so great is the demand, that all the establishments in Wales have already orders for execution to keep them busy during the remainder of this year; and as orders continue to come in from all quarters, principally from the Mediterranean, Holland, Germany, the United States, and also for exportation to the East Indies and China, whilst the home demand, for Railway and other purposes, is for an extraordinary amount, there is every prospect of another advance of 10 shillings per ton, before the expiration of many weeks. I am told by experienced persons, that the demand now is greater for iron than was ever before known, excepting during the bubble year, 1825, when the demand was altogether of a speculative character; now the demand appears to be, exclusively and *bona fide*, for immediate consumption.

To show you how this affects Railway Iron, I will communicate a few particulars of my own transactions, within a few months. I contracted, on the last of March last, on behalf of a Railway Company, in the State of New-York, for about 1000 tons of iron, and paid £7 : 4 per ton for edge rail, (being No. 8 iron, and when manufactured into rails, ought to be 40 shillings per ton higher than common No. 2 bars.)

Early in May I contracted, in behalf of a New-Jersey Company, for about 1600 tons of edge rails, at £7 : 6 per ton. Last month, September, after iron had advanced 20 shillings per ton, I made a contract for 2000 tons of edge rails, for a Delaware Company, at £8 : 5 per ton; and a few days after, for 1300 tons of edge rails, for a Pennsylvania Company, at £8 per ton, but the pattern is less difficult to roll than that for the Delaware Company. I have also contracted for several thousand tons of chairs, pins, wedges, flat bars, &c., but it is unnecessary to give their prices, because they are regulated also by the price of No 2 common bars.

To enable your readers to judge what would be the price of to-day, if I were now in the market, I should think the March, May, and September contracts could not be done under £8 : 15 per ton; and that for the Delaware Company, (being difficult to manufacture,) not under £9 per ton. From this you will see, that those Companies who sent their orders early, have reason to congratulate themselves, that they have been executed before the great advance in iron was effected. As the great Railway from "London to Liverpool" (220 miles) may want some 20,000 or 25,000 tons of very heavy rails, (60lbs. per yard,) in the spring, and as the "Southampton," (75 miles,) "Western," (120 miles,) and many other minor Railways will want large quantities, during the summer of next year, I should not be surprised if edge rails should be advanced to £11 per ton, by the 1st of May next, and iron will continue high during the whole of next year. I may be mistaken, but having had some experience in this trade, from having bought and exported to the United States (my brother and myself) upwards of 40,000 tons of Railway Iron, within a few years, I think I have some acquaintance with the iron market of this country. If the French Government should imitate the wise example of our American Government, and allow Railway Iron to be imported free of duty, as it is now reported to be their intention, I have no doubt this will give an impetus to the construction of Railroads in that country, which will still further advance the price of iron. All countries throughout the world must get their Railway Iron in England, where it is manufactured with such economy, such rapidity,\* and so perfectly, that it is useless to pretend to compete with this branch of industry.

I beg to send you the *London Mechanics' Magazine* for August, and to ask the favor

\* I once had 1600 tons of edge rails, of 40lbs. per yard, manufactured and shipped within 4 months from the time the order left America. It was for the State of Pennsylvania; the order left Philadelphia on the 6th May, and all the iron was on ship board, on its way to Philadelphia, before the 1st of September following. This extraordinary despatch was accomplished by one house in Wales, who had their regular business orders to attend to, besides the execution of this contract. The whole of France could not execute this order in 4 months! But I would not promise equal despatch now, for all the iron masters are so busy, and have such an abundance of orders, that much more time than usual must now be allowed to them.

of your obtaining some information respecting the steamboat "Lexington," plying between New-York and Providence. You will observe, in page 384, an account of the performance of this boat from Providence to New-York, 210 miles, in 12 hours, which I cut out of a New-York paper, and sent to the Editor for publication; and in pages 430 and 431, the whole account is treated as a gross exaggeration by "Fanqui," and discredit is thrown upon it by W. Thorold, of Norwich. You will observe the Editor of the Mechanics' Magazine invites the attention of Americans to the letters of Mr. Thorold and Fanqui, for the purpose of controverting their doubts, and to furnish additional information respecting "the fastest boat in the world." I have no means of obtaining this information, or I would not trouble you. But if you will publish Fanqui's letter, and request the proprietors of the "Lexington" to furnish you with authentic information respecting her, which publish, and request the Editor of the London Mechanics' Magazine to transfer to his columns, the character of our countrymen may be vindicated. People in this country think we are rather disposed "to shoot with the long bow," and it is desirable to correct this opinion, so injurious to our national character.

I am, dear Sir,

Very respectfully, yours,  
GERARD RALSTON.

In relation to the steamboat Lexington, and the correspondents of the London Mechanics' Magazine, our reader are in possession of the whole subject; and we hope soon to give them, and the readers and doubters of the London work, such evidence of the performances of that extraordinary boat, as will put at rest the controversy about the "fastest ship in the world."

**LONG LEVELS, WITH STEEP GRADES,** in preference to a more uniform distribution through the whole line of the elevation to be overcome, appears to be the opinion of several of the most eminent Engineers in Great Britain.

We publish to-day several extracts from an examination, before the House of Lords, of Mr. Vignoles, Mr. George, and Mr. Robert Stephenson, Mr. Henry R. Palmer, Mr. H. H. Price, and Dr. Lardner, in relation to the most judicious Grades for a Railroad. There appears to be but one opinion amongst them on the subject, which cannot be better expressed than in the language of Mr. Vignoles, in reply to the question, "Do you prefer the course of concentrating the inclination?" which is as follows, viz. "it is far better to keep the line as flat as possible, for a great length of time, and concentrate your power by having a stationary Engine, or an assistant Engine, to overcome it"—(the inclination.)

We annex some remarks upon the London and Brighton Railway, together with a table of Gradients of Mr. Gibbs and Mr.

Stephenson, which differ materially in the distribution of the Grades.

We are indebted to Mr. G. Ralston, of Philadelphia, now in London, for these and other favors, for which he will please accept our thanks.

*Remarks on the two proposed lines of Railway to Brighton.*

Two lines of Railway to connect Brighton with London have been proposed separately by Mr. Gibbs and Mr. Stephenson.

Mr. Gibbs' line terminates at one point in London by the Croydon Railway, and at another by means of the Southampton Railway; Mr. Stephenson has subsequently, in his proposal for a Brighton Railway, fixed upon nearly the whole of Mr. Gibbs' line, but has adopted a different principle in planning his gradients.

The grand point of difference in the two lines is, that the gradients of the one, namely, Mr. Stephenson's, have the several rises and falls distributed over their whole length, whereas Mr. Gibbs has concentrated the rises and falls on his line in a few points, in order to obtain throughout the rest of the line either levels, or planes of such slight inclination, that practically speaking, they may be considered level.

The following table of the gradients on the two lines, will show that Mr. Gibbs has almost entirely confined his ascents and descents to three short planes, while Mr. Stephenson has distributed nearly the whole of his over 33 miles, with an inclination of 1 in 330.

*Table of Gradients.*

MR. GIBBS' LINE.				
Miles.	Chains.	Level.	Feet per Mile.	
11	56

It is well known to all those who have attended to the progress of Railways in this country, that the question as to what description of gradient is best adapted for the transit on Railways, has excited the most anxious interest in the scientific world and amongst Engineers.

Accordingly we find that the Committee of the House of Lords on the Great Western Railway Bill, has received important evidence from various Engineers upon this amongst other topics which engaged their attention.

From the evidence adduced before this Committee, the following extracts are taken.

It is unnecessary to comment upon these extracts, which contain the recorded opinions of some of the most eminent Engineers in this country, and their opinions are of so recent a date, that they must be supposed to express the result of their matured judgment and experience up to the present time.

Mr. George Stephenson in evidence on the Great Western Railway Bill, July 1st, 1835.

Question. With the exception of the

Box Tunnel, you know of no Railroad of such an extent with such advantageous levels?

Answer. I do not.

Question. With reference to the inclination of the Box Tunnel, in your judgment, is it advisable to select a point where, by making a steeper inclination upon a short line, you can regulate the rest of the levels upon the line advantageously?

Answer. It is always the plan I have adopted in all the works I have been concerned in.

Question. Was that the reason you adopted the short plane on the Liverpool of a mile and a half, where you have one in ninety-six on the one side, and one in ninety-eight on the other?

Answer. It is about ninety on the other.

Question. Did you select those inclinations in preference to spreading it over a larger surface of your Railway?

Answer. I did.

State your reasons for doing it.

Answer. To allow the engines to bring the heaviest loads possible to the bottom of the inclined plane, by having an assistant engine to get up the load; but if I had distributed that inclination over a longer length, the engine could not have got up that long incline, and it is too long to have an assistant engine.

Mr. George Stephenson. July 2nd, 1835.

Question. Is not the expense of the repair of the engines very much in proportion to the gradients upon the line?

Answer. It is.

Question. And the difficulties they have to overcome?

Answer. Yes.

Question. And therefore you think it better to have a steeper rise at one place, to be worked by a supplementary engine, or a fixed engine, than to give worse gradients throughout the line?

Answer. That is my opinion.

Mr. Vignoles in evidence on the Great Western Railway Bill. July 13th, 1835.

Question. Is 1 in 107 a very bad plane?

Answer. No; it appears scarcely a rise to the eye of a common observer; it is a plane that requires great additional power, and it is better to concentrate the power in one spot than expend it upon long inclinations over a greater space of ground.

Question. Do you prefer that course of concentrating the inclination?

Answer. Most undoubtedly; it is far better to keep the line as flat as possible for a great length of time, and concentrate your power by having a stationary engine, or an assistant engine to overcome it.

Copy of a Report by Messrs. Stephenson and Palmer.

"To the Directors of the Great Western Railway Company:

"Gentlemen,—In reply to your inquiry relative to our investigation of the proposed line of Railway between London and Bristol, in which you particularly refer to the practical construction of the work, and the working of it by locomotive engines when completed, and whether Mr. Brunel had taken our opinion before he made the selection between the two inclinations at Box; we beg to state that we have examined the whole of the important parts of the proposed line, and consider it judiciously selected, not only as regards the execution, but also the working of the line when executed; and that Mr. Brunel did take our opinions upon the two planes at Box.

"Our advice to him was that he should

select the shorter and steeper, as by concentrating the rise in one point, with a practicable length for working either by stationary or assistant locomotive engines, he reduced all the remaining inclinations upon the line to the present favorable amount. And we beg in addition to this to state, that many lines with planes of similar or greater length have been executed, and are now working efficiently, and that no difficulties in the execution of the work can be anticipated.

"The levels of your proposed line are undoubtedly superior to those of the Southampton, or the Basing and Bath, or of any other extensive line with which we are acquainted, and are therefore better adapted to the working of the locomotive engines, both as regards economy and expedition."

"We are, gentlemen,  
"Your obedient servants,  
"GEORGE STEPHENSON,  
"HENRY R. PALMER.  
"London, March 31st, 1835."

*Mr. R. Stephenson in evidence on the Great Western Railway Bill. July 6th, 1835.*

Question. Is there more than one way of working a Stationary Engine?

Answer. Yes.

Question. Are those different methods attended with difficulty?

Answer. No; I have seen them all act very efficiently.

Question. I do not know whether you remember the alternative suggested, instead of that Box Tunnel, with a rise of 1 in 107 for two miles and a half?

Answer. Yes.

Question. It was 1 in 333 for nine miles?

Answer. About that.

Question. Which do you prefer?

Answer. I prefer the concentration of the inclination.

Question. What do you gain by the concentration of the inclination?

Answer. You apply a fixed Engine to that to which it is more applicable, and it is more economical upon that inclination; and you make the remainder of the distance extremely favorable for the operation of Locomotive Engines.

Question. What do you gain by it in point of power?

Answer. Very great economy of power, and you save a great deal of wear and tear in the Railway.

Question. Where the proportion of that inclination is two miles and a half, and the rest of the line such as you have described it, do you gain in point of speed also?

Answer. Yes; but the principal saving is economy.

*Mr. R. Stephenson in evidence on the Great Western Railway Bill. July 10th, 1835.*

Question. Have you any knowledge of the Tunnel at Box Hill, except what you have derived from Mr. Brunel?

Answer. As to the cost of making the Tunnel I cannot give an opinion.

Question. Do you know any thing of the country at that spot, so as to judge of the expediency of making a tunnel or not?

Answer. No; I treat it as an abstract question.

Question. Tell me the data upon which you proceed?

Answer. In preference to an inclination of six or eight miles at sixteen feet in a mile, I prefer a Tunnel; but I would not make a Tunnel in other cases to avoid an

inclination; it is made here to enable the common engine to accomplish the journey upon the rest of the line.

*Mr. H. H. Price in evidence on the Great Western Railway Bill. July 7th, 1835.*

Question. With reference to the Box Tunnel, do you approve of the method we have heard so much of, namely, the concentration of the steepest inclination upon one spot?

Answer. Yes; I stated that opinion to Mr. Brunel when I first met him at Stroud, after the plans were deposited.

Question. That is not an opinion you have taken up lately?

Answer. No.

Question. What is the advantage gained by that concentration?

Answer. That you may apply assistant power to overcome the elevation of the country at one point, instead of spreading it over a greater space of the line.

Question. What is the result if you do not apply assistant power?

Answer. They carry lighter loads, or they go at a smaller speed.

Question. Or—is there not another alternative?

Answer. You may have a fixed engine.

*Dr. Lardner in evidence on the Great Western Railway Bill. August 6th, 1835.*

The artifice used in forming the Great Western Line (and a very good one it is) consists in concentrating the greatest rise in both directions upon one spot, and by that means obtaining a more uniform level, and so far as that goes it is a great advantage.

*Mr. R. Stephenson in evidence on the Southampton Railway Bill. June 25th, 1834.*

Question. Is it an object also to get the best levels that can be got?

Answer. Of course it is.

Question. If the level in such a Railroad as this, is such, that there are fifteen miles in going up to the summit of 1 in 300, would you consider that as an inconvenient rise, if you could avoid it?

Answer. If I could avoid it, certainly.

Question. Would you prefer lessening the inclination, and having a short part where the inclination should be so much greater as to require the assistance of an Engine.

Answer. I think I would prefer a short piece.

Question. Upon the Liverpool and Manchester you have two inclinations of one in eighty-six and one in ninety-six?

Answer. Yes.

Question. Was that mode of construction adopted with a view of enabling the engines to act with all their full power up to the rest of the line, and to have the assistance of stationary engines at that point?

Answer. That was the object.

Question. I believe you consider that an inclination of 1 in 240 diminishes half the power?

Answer. Yes, thereabouts: it has been taken at 300, but I think 1 in 240 is more correct.

Question. Should you consider it desirable to construct a line of Railroad with fifteen miles with an inclination of 1 in 300, or should you prefer a shorter length of a steeper inclination?

Answer. I should prefer the short inclination, if the other levels that were obtained by that means were good levels.

Question. If by making a steep inclina-

tion for a short distance of two or three miles, you could lessen the inclinations upon the general line, so as to enable the locomotives to carry a weight nearly to the extent of their power, you would consider that a preferable mode?

Answer. Yes, I would; it is impossible to give a general answer to that question; I should be guided by the circumstances of the case.

Question. Supposing you could form a line in which you might go with an inclination, where instead of diminishing the power of the engines one half, it was not diminished one quarter, but when they arrive at a particular point, they might require the assistance of another engine, because it diminished the power two-thirds, would you prefer the [line] upon which the diminution of the power of two-thirds was only for a short distance, and where the rest of the line gave three-fourths of the power?

Answer. I think I would.

Question. (By a Lord)—Might not there be other circumstances which would render the other line the best?

Answer. I merely speak as an Engineer generally upon the subject. I cannot at all speak as to any local difficulties that may arise; speaking as an Engineer, I would prefer a long line, upon which an engine could operate to its full power with a short inclination when an assistant engine was wanted.

A CANAL ROUND THE FALLS OF NIAGARA is certainly a desirable link in our chain of internal communication on the great lakes.

The highest considerations of expediency connected, not less with the military defence of the Northern frontier, than with the commercial and agricultural interests of this State, and of the whole Mississippi Valley, point to the construction of such a Canal—if found reasonably practicable.

From a Circular published to-day, drawn up by a committee in Oswego, it would seem that a survey of the route has been made, during the past season, under the authority of the general government, which establishes the complete practicability of the work; and, accordingly, memorials are to be addressed to Congress, at the approaching session, asking their aid towards its accomplishment. We hope these memorials will be multiplied, so as to constitute an irresistible call upon the National Legislature to do what is needful in the matter.

The Oswego Circular argues the matter mainly as a local interest. It has, however, higher claims than that; nor need Buffalo even apprehend, if the Canal should be constructed, and a Ship Canal to boot between the Hudson and Oswego, but that it still would flourish abundantly, and grow with the growth of all around it.—[N. Y. American.]

#### Canal round the Falls of Niagara. CIRCULAR.

Oswego, Nov. 6th, 1835.

SIR,—The undersigned, a committee appointed by the citizens of the county of Oswego, in the State of New York, in relation to the Niagara canal, and especially for the purpose of presenting a Memorial to Congress, and for disseminating information respecting the merits of the project to their fellow citizens in other parts of the Union, would respectfully offer to your consideration the following statements.

Memorials exhibiting the great advantages anticipated from the construction of a Ship Channel, by which the obstruction now interposed by the Falls of Niagara to an uninterrupted navigation from the upper Lakes to Lake Ontario would be removed, have been presented to Congress from several parts of the State of New York, the north western States, and the Michigan Territory. These Memorials met with a very favorable reception,

and would probably have led to some favorable action on the subject, but for the limited term of the last session, and the absorbing questions which occupied its close. The Department of War, however, deeply impressed with the importance of the projected Canal, not only in respect to the commercial relations subsisting between the East and the West, but to the military defence of the Northern frontier, in the month of May last detailed a corps of Topographical Engineers for the purpose of prosecuting the explorations and surveys incident to its construction. These explorations and surveys have been effected during the late season under the direction of Capt. W. G. Williams, a gentleman distinguished by science and the possession of every acquirement requisite for the faithful and able execution of the duty entrusted to him. We are happy to state that Capt. Williams' survey furnishes the most gratifying results in respect to the practicability of the work, and the facilities for its execution. His report will be submitted to Congress early in the ensuing session.

We therefore avail ourselves of the opportunity to inform you that Memorials to Congress, praying for the construction of the Canal as a National work, and for an appropriation therefor, will be presented at the ensuing session, from many parts of the State of New York, and would respectfully submit to you the expediency of sustaining these Memorials by others from your section of the Union.

We are of opinion that no constitutional objection will interpose to prevent an appropriation for this great object. It is a matter of great national interest as a military work, and is in immediate connection with the constitutional power expressly granted to Congress for the regulation of commerce between the States, with foreign nations and the Indians tribes; for to all these would the removal of the barrier of the Falls of Niagara afford immense facilities.

It is our fellow citizens of the West, whose trade is tributary to the Lakes, who are most immediately and extensively interested in the proposed improvement. Its value to them can in some measure be ascertained from the results of the intercourse now subsisting between the Port of Oswego, on Lake Ontario, and the Ports upon the Upper Lakes by means of the Welland Canal. About 25,000 tons of merchandize have been shipped for the West from the city of New York during the present year, and have passed westward through the Ports of Buffalo and Oswego. Of this amount about 20,000 tons have been shipped from Buffalo, and about 5,000 tons from Oswego.

Supposing the whole 25,000 tons had passed through either Port, the rates of transportation charged by the forwarders of Oswego and Buffalo furnish the following results:

*Freight of 25,000 tons of merchandize from New York via Buffalo to Cleveland.*

Usual freight, 1835, \$1.13 per 100 lbs. for heavy goods; do do \$1.29 do light do.  
Average freight \$1.20 per 100 lbs. or \$24 per ton, amounts to \$600,000

*Freight of 25,000 tons from New York via Oswego to Cleveland.*

Usual freight, 1835, 60 cents per 100 lbs. for heavy goods; do do 75 do light do.  
Average freight 67 cents per 100 lbs. or \$13.40 per ton, amounts to \$335,000

Difference in favor of the Oswego route, \$265,000

*Freight of 25,000 tons of merchandize from New York via Buffalo to Chicago.*

Usual freight, 1835, \$1.50 per 100 lbs. for heavy goods, do do \$1.70 do for light goods,  
Average freight \$1.60 per 100 lbs. or \$32 per ton, amounts to \$800,000

*Freight of 25,000 tons from New York via Oswego to Chicago.*

Average freight charged this year, \$1.05 per 100 lbs. or \$21 per ton, amounts to \$525,000

Difference in favor of the Oswego route, \$275,000

It is found from experience, since the completion of the Erie Canal, that the transportation westward quadruples in the period of five years. In 1840 then, the amount of Western freights will be 100,000 tons.

The charge upon this at present prices, by the Buffalo route, would be to Cleveland, \$2,400,000

By the Oswego route to Cleveland, 1,340,000

Difference in favor of the Oswego route, \$1,060,000

It is reasonable to estimate that the transportation Westward in 1845, will be 250,000 tons. The difference between the Oswego and Buffalo routes will always maintain the same proportions. At the present prices, the difference in favor of the Oswego route to Cleveland on 250,000 tons would be \$2,650,000

On same to Chicago, 2,750,000

The justice of these estimates we refer to yourself, and shall draw no inferences from them. We would merely remark, that whatever the difference is, will be an annual charge upon the enterprise and industry of the West. Neither shall we detain you by any remarks upon the immense influence which an uninterrupted navigation from Lake Ontario to the upper Lakes will necessarily have upon the value and the settlement of the public lands.

The object of this communication is, to request your aid and influence in behalf of the projected canal, and we would respectfully submit to you the expediency of calling meetings of your fellow citizens, of expressing your views to your Representatives, and presenting memorials to Congress, asking the requisite appropriations for the execution of the great national work in contemplation.

With great respect, Sir, we are,  
Your most obt. serv'ts,

C. J. BURCKLE,  
G. H. McWHORTER,  
M. P. HATCH,  
A. P. GRANT,  
J. N. BONESTEEL,  
WM. F. ALLEN,

Corresponding  
Committee.

**ERIE CANAL.**—As the enlargement of the Canal is about going into effect, is it not expedient to inquire, whether its route cannot be judiciously rectified in some parts?

Great complaint has always been made against the section between Schenectady and Albany.—The direct route between those cities is but 15 miles, and yet the Canal is 30 miles in length and crosses the Mohawk twice between Schenectady and the Hudson. Cannot that great circuit be avoided? The table land between the Mohawk and the Hudson descends upon an average from 12 to 20 feet on the mile from the former to the latter river, and as it is but little more than 100 feet high at Schenectady, it might be cut through at a small expense, until the level line of the Mohawk was brought to the top of the table land in its descent to Albany. If one of the ravines on the Mohawk side, or the Sandkill valley, should be taken for the route, the expense would be lessened.

The annual saving on the canal navigation would soon pay the expense. There are now between 30 and 40,000 canal boats arriving and clearing at the Hudson annually. The saving to each boat in tolls for 15 miles canal travel would be \$7 and as much for returning, and the wages and expenses for the time saved in 5 hours each would be at least one dollar per boat.

An annual saving therefore of between two and \$300,000 would be made by thus rectifying this part of the eastern section of the canal, besides rendering the canal itself more secure—the route being entirely inland instead of crossing and recrossing the Mohawk by aqueducts. Does not this subject deserve a full investigation?

It may be matter of news to some of our readers, to say, that it is in contemplation to straighten the canal a little east of this city, by cutting through the hill near Gideon Cobb's, and that the survey has already been made and the location staked out.—[Rochester Democrat.]

[From the New-York American.]

**OUR HARBOR.**—The survey of Sandy Hook Bar, which has been made by Lieut. Thos. R. Gedney, of the United States Navy, and others, by order of F. R. Hassler, Esq., Superintendent of the U. S. Coast Survey, has been completed this season, and was, a day or two since, exhibited to the Chamber of Commerce.

By this survey, a new channel over the Bar has been discovered, having 23 feet water at the lowest tides, and it is hoped measures may be taken by the

merchants, and insurance companies, to have this channel buoyed out, early in the spring.

The manner in which the survey of the coast has been carried on, since the appropriation in 1833, will reflect lasting credit on the country; and the determination of the administration to carry on a proper triangulation of the whole coast, will save millions to the country, while it will enrol the names of its supporters among those to be remembered with gratitude by the commercial community, now, and in time to come.

The proper determination of points along the coast has been long a desideratum, and the impossibility of carrying on a survey of any extent, without a triangulation, is now established. Hence, notwithstanding the sums of money heretofore spent in surveys by Government, there are not, it is said, half a dozen points on our coast, the lat. of which is known with the accuracy that may be attained.

The labor, time, care and skill, requisite to conduct such a survey as that of this harbor alone, can only be judged of, by those who examine, as we have had the opportunity of doing, the result as laid down on a chart; and we repeat the expression of our hope, that the merchants and insurers of this city will cause it to be engraved and published forthwith. The sale of the charts would soon indemnify the cost of publication, to say nothing of the diminution of risk to property and life, which it would certainly effect.

[From the same.]

**THE AMERICAN JOURNAL OF SCIENCE AND ARTS,** conducted by BENJ. SILLIMAN, M. D. LL. D.—October. New-Haven, H. MALTBY and HERBERT & NOTES. New-York, G. & C. CARVILL & Co.—This number is almost entirely given up to an account of the coal formation of the Ohio and its confluent rivers, by Dr. S. P. HILDRETH, of Marietta, Ohio. The mass of information, of various results, and magnificent realities, embodied in this paper, makes it of great interest—even to unscientific readers. There are annexed to the account several pages of woodcuts, representing accurately the various fossil remains found in the coal beds, and occasionally portions of the striking scenery amid which these beds are stretched far and wide.

Personally, we read this paper with the more interest from having last Spring passed over a portion of the region described in it, and been struck with the prodigality of nature in her gifts to it. The annexed account will, we are sure, be new, as well as interesting to many of our readers.

**THE BITUMINOUS COAL FIELDS OF PENNSYLVANIA.**—Nature, in the disposition of her bounties, seems to have bestowed upon Pennsylvania, more than a due proportion of the treasures of the mineral kingdom. Great and valuable as are her anthracite deposits, and rich and abundant as are her mines of iron ore and other minerals, her bituminous coal region is still more extensive and inexhaustible. The great secondary deposit, extending as is generally believed, from the Hudson to the Mississippi, and to the Rocky mountains, is in Pennsylvania limited by the Allegheny mountains, which appear to form the barrier, or dividing line between the anthracite and bituminous coal beds, or between the transition and secondary formations. The union or junction of these formations is plainly and distinctly marked in the end of the mountain, where the west branch of the Susquehanna breaks through it, above Bald Eagle, the latter resting against the former, and forming the basin in which the bituminous coal, in regular and successive strata, is deposited. The coal field is therefore confined to the west side of the Allegheny, and is supposed to extend to the centre of the mountain. In the S. E. corner of Somerset county, and in the western parts of Bedford and Huntingdon counties, it would appear to extend to the S. E. of what is there called the Allegheny, and occurs in great abundance on 'Wills' creek, Penn-

Wells' creek, &c. emptying into the Potomac. The chain of mountains called the Alleghany above Bedford, is very wide; and large mountains diverge from it, and although the mountain ranging through Somerset and dividing the waters of Youghiogania and Conemaugh, from those of the Potomac, may be the largest, it seems most probable that Wells or Everts, or possibly Siding mountain, there forms the boundary of these deposits, and upon examination will be found to exhibit a continuation of the same characteristic features between the secondary and transition formation."

The bituminous coal beds, vary from one foot to twelve feet in thickness, but rarely exceed six feet. They lie in nearly horizontal strata, with about sufficient dip to free the seams from water—some hills contain three and four beds, with alternate layers of earth and slate, and rest between a firm and smooth slate roof and floor. Faults or troubles are seldom met with, and in this they differ from the anthracite, and go far to confirm the opinion, that all this vast extent of secondary rocks, was once the bottom of the great lake or sea, and that it suffered little if any interruption from the gradual discharge of its waters, through its distant and widely extended boundary. It has evidently been drained by the Mississippi, the St. Lawrence, the Susquehanna and the Hudson; and it is a curious and interesting fact, that near the northern termination of this coal field, in Potter county, the head waters of the Alleghany, the Susquehanna and the Genesee rivers, flowing into the gulf of Mexico, the Chesapeake and the St. Lawrence, take their rise in an area or space of about five miles.

With the exception of the Susquehanna and its tributaries, and Wells' creek, emptying into the Potomac, all the streams rising in the coal field, west of the mountains, flow into the lakes, or into the Ohio river, and consequently the ground falls off or recedes in the same direction, and becomes too low, as is generally supposed, to contain the coal measures. Its northern termination or boundary may be traced from the head waters of the Towanda creek, in Bradford county, thence across the high lands or dividing waters of Tioga, Potter, McKean, Warren, Venango, &c., to the Ohio State line.—The Tioga river and its tributaries penetrate the coal field in the vicinity of Blossburg and Wellsborough in Tioga county. A recent and interesting mineralogical report, upon this region, has been made, by R. C. Taylor, a practical engineer and geologist, for the Blossburg Railroad Company, in which it is satisfactorily shown that the coal runs out as the streams decline to the north.—"There would need," says the report, "a total height of mountains of five thousand, one hundred and twenty feet, at the State line between New York and Pennsylvania, to contain the coal measures, whereas the hills, there, are probably below six hundred feet in altitude. This calculation is entered into with a view of showing the futility of the expectation, not uncommonly expressed, of tracing these coal fields in a northerly direction beyond the limits at which they are at present discoverable."—"This field being bounded on the south by the Alleghany mountain, extending into the State of Virginia, and westward; coal may be said to be present, to a greater or lesser extent, in all the western counties, with the exception of Erie, in which it has not been discovered. The counties of Bradford, Lycoming, Tioga, Potter, McKean, Warren, Crawford, Bedford, Huntingdon and Centre, lie partly in and partly out of the coal field. The counties of Alleghany, Armstrong, Beaver, Butler, Cambria, Clearfield, Fayette, Greene, Indiana, Jefferson, Mercer, Somerset, Venango, Washington and Westmoreland, are wholly within its range, and embrace together an area of twenty-one thousand square miles, or thirteen millions four hundred and forty thousand acres." Coal has been used for fuel and manufacturing purposes, west of the mountains, from the earliest settlement of the country. It is mined, to a greater or less extent, in all the above counties, at the rate of one cent and two cents per bushel, and is thus brought within the means of all, and literally to every man's door—abounding throughout all this vast extent of territory, and fitted and used for almost every purpose requiring heat, it is impossible to form any thing like a correct estimate of the quantity consumed yearly, and sent to market. That its great abundance and cheapness have given birth to the vast and widely extended manufacturing establishments of the west, there can be no doubt. Without coal they could not exist. It constitutes the life spring of Western Pennsylvania, and the

pedestal of our great manufacturing emporium.—Pittsburgh and its environs contain ninety steam engines for the various manufactures of iron, steel, glass, cotton, salt, brass, white lead, flour, oil, leather, &c. These engines consume two millions sixty-five thousand three hundred and six bushels a year. The city of Pittsburgh and its suburbs, Alleghany town Birmingham, &c., contain a population of thirty thousand souls. "The coal consumed for every purpose, in and about Pittsburgh, is estimated at seven millions six hundred and sixty-five thousand bushels, or two hundred fifty-five thousand and five hundred tons—at four cents per bushel, the price now paid in Pittsburgh, it would amount to three hundred and six thousand five hundred and twelve dollars." "The coal consumed in the manufacture of salt, in the western counties is very great. There are on the Alleghany, Kiskimintus, Conemaugh, Crooked creek, Mahoning, Saw mill run, Brush creek, Sewickly, Youghiogania and Monongahela, about ninety salt manufacturing establishments and many others about going into operation. These establishments produce yearly about one million bushels of salt and consume five millions of bushels of coal."—"The cooking process is now understood, and our bituminous coal is quite as susceptible of this operation, and produces as good coal, as that of Great Britain. It is now used to a considerable extent by our iron manufacturers in Centre county and elsewhere."

These facts, elucidating the immense mineral wealth of the "valley of the Ohio," open to the imagination a long vista of power and greatness, which the utmost stretch of the imagination is hardly able to equal.

The Cannel Coal has as yet only been found in the vicinity of Cambridge, Guernsey Co., Ohio, though it is supposed also to exist about the head waters of the Muskingum, considerable masses of it having been picked up on the banks of that river, brought down by the current. We were not before aware that this most brilliant and combustible of coals had been found at all in the United States.

There is a vast amount of information in this paper, to which we would desire to advert, but know not what to select, and therefore confine our extract—having begun with coal—to the subjoined speculation upon

**COAL DEPOSITS.**—The immense beds of bituminous coal found in the valley of the Ohio, fill the mind with wonder and surprise, as it reflects on the vast forests of arborescent plants required in their formation. Age after age, successive growths of plants, springing up in the same region, were entombed beneath thick strata of shale and sandstone, until the whole series had accumulated to a depth of more than a thousand feet: while beneath the whole, lay the bed of an ancient ocean floored with fossil salt. Indications of coal are found at intervals, across the great valley, from the Alleghany to the Rocky Mountains. It is found near the surface in Kentucky, Ohio, Indiana, Illinois and Missouri, and without doubt, may be found beneath the extensive territory deposits, which form the substratum of the great prairies in the central and northern parts of the western States. As low down as New Madrid on the Mississippi, coal was thrown up from beneath the bed of the river, by the great earthquakes of 1812—a sufficient proof of its continuation in the most depressed part of the great valley.

That coal is of vegetable origin, no one who has read much on the subject, or personally examined the coal beds, will now deny. Time was, when it was considered a peculiar mineral product, formed in the earth in the same manner and at the same time with the rocks that surround it. The product of its chemical analysis, being altogether vegetable, and the artificial formations of coal from wood by Sir James Hall, have silenced all doubts on the subject. The only mystery now is, how such vast quantities of vegetable matter could be accumulated and grow on the spot where they were buried. That they grew in general, on the surface now occupied by the coal, appears certain from the perfect state in which the most delicate leaves and stems are preserved. Had they been transported by currents of water, and especially from any distance, it is hardly possible that they should not have received more damage. The climate, at that period, must have been both more warm and more

humid than at present, as many of the plants are of those families which now grow only in tropical climates; and as the laws of nature never change, this may be deemed a correct inference. A similar climate seems to have prevailed in the latitudes north of 30°, both in Europe and in America, many of the same plants being common to the coal strata of both countries, as will be evident by comparing the drawings of several of the species found in the valley of the Ohio, with those exhibited by M. Brongniart, in his work on "Des vegetaux Fossiles," of the European coal beds. South of lat. 30°, but few coal deposits are found, the climate requiring but little fuel for the comfort of the inhabitants; but north of that parallel, many districts could be but very thinly inhabited, or perhaps not at all, were it not for the wonderful provision of coal laid up in the bowels of the earth for the use of its inhabitants, after the forests were destroyed to make room for cultivation.

The coal deposits of Britain, by nourishing her manufactures, which have raised her to her present proud attitude among the nations, are the principal source of her present greatness.

In the valley of the Ohio, some of the coal beds, were covered with marine deposit; in others the deposit was made in fresh water, as is demonstrated from the character of the fossil shells found in the rocks, both over and under the coal. In what manner these changes were brought about, remains for future geologists to determine, after the science has become mature.

Where not removed by degradation, or buried under other strata, there seems to have been three distinct deposits of coal throughout the main coal region, embraced on the map, which accompanies these observations. After the vegetable materials which form the coal beds, were deposited or buried under the superincumbent strata, it would seem that a strong degree of heat had been applied, in addition to the pressure, before they could assume their present bituminized appearance. As we approach the coal beds, in the transition and primitive rocks, the evidences of heat are still more apparent; removing from the anthracite beds, all, or nearly all their bituminous contents; and in the primitive, changing anthracite into graphite, or plumbago, which is almost pure carbon. It would appear, that we cannot reasonably doubt the action of heat on these coals, for the plumbago is evidently a coal, changed by heat into its present semi-metallic appearance, and is often produced in the furnaces of the arts, by the action of heat upon carbon. A less degree of heat has been applied to the bituminous beds of "the Valley of the Ohio," for they are far removed from any crystalline or transition rocks, on which the marks of heat are so apparent, and therefore could not receive a sufficiency to deprive them of their bituminous principles and change them to carbonaceous coal beds. The suggestion advanced by many geologists, and recently applied by Prof. Hitchcock, in his geology of Massachusetts, that graphite, anthracite and bituminous coals are all of vegetable origin, and changed by heat and pressure to what they now are, is a simple and beautiful illustration of a heretofore obscure and difficult subject.

**INTERNAL IMPROVEMENT CONVENTION AT UTICA.**—A public meeting was held at Brooklyn on Friday evening, at which ten delegates were appointed, on behalf of Brooklyn and Long Island at large, to attend the Convention at Utica. The following gentlemen were named, with power to supply any vacancies:—Gen. Jeremiah Johnson, Joseph G. Swift, John Lawrence, Alden Spooner, Henry F. Pierpont, Benj. D. Silliman, Geo. Hall, Edward Copland, Anna Wright, Clarence D. Sackett.

"We know that a very active and extensive business is carried on in this city, in the article of oysters, destined for the consumption of the people west of the Alleghany, but we were not aware, until we saw the fact mentioned in a western paper, that it had become so large as to justify the establishment of a regular line of wagons to Pittsburgh, for the transportation of oysters exclusively."

The above paragraph, from the Baltimore American, relates an extraordinary fact, but one of which there is, we apprehend, no doubt. We were tempted, last April—being casually in Cincinnati—by the novelty of the thing, at such a distance from the seaboard, to eat some oysters from the shell: they were not injured by the long transportation over mountain and valley, and were sold at not more than double the price paid in this city.

[From the Journal of the Franklin Institute.]

*Reply to a Circular in relation to the Occurrence of an unusual Meteoric Display on the 13th of November, 1834, addressed by the Secretary of War to the Military Posts of the United States, with other facts relating to the same question.* By A. D. BACHE, Prof. of Nat. Philos. and Chem., Univ. Penn. (Communicated by the Author.)

Having found that the inference drawn from my observations on the morning of the 13th of November, 1834,\* at Philadelphia, was directly opposite to that to which Professor Olmsted had been led, from his observations at New-Haven, I felt naturally desirous to determine what might have been the extent of country over which the unusual display of meteors seen at New-Haven had taken place, this extent having a direct bearing upon the question of the nature of the phenomenon. At my request, communicated through the kindness of the Chief Engineer, the Secretary of War, Gov. Cass, issued a circular to the commandants of the different military posts of the United States, requesting to be informed whether any unusual meteoric display had been witnessed at their respective posts, on the morning of the 13th of November, 1834.

The results of this inquiry, I propose now to put upon record, in as brief a manner as possible. The arrangement adopted in the record, is to begin with the most northern post on our north-eastern frontier, to pass southward along the Atlantic board; then beginning with the most southerly post of the western chain, to pass northward along that chain, then eastward on the northern frontier, towards the original point of departure. Along this line, the display of November 13th, 1833, attracted universal attention.

From Hancock Barracks, Holton Plantation, Maine, Maj. Clarke reports that no recurrence of the meteoric phenomenon of 1833, was observed on the 13th of November, 1834.

A similar report is made by Maj. McClintock, in relation to Fort Preble, Portland, Maine, and its vicinity.

No unusual meteoric phenomenon was observed at Fort Constitution, Portsmouth, New-Hampshire, as stated by Maj. Anst; nor at Fort Trumbull, New-London, Connecticut, as stated by Maj. Saunders; nor at Fort Hamilton, New-York Harbor, according to the report of Maj. Pierce; nor at Fort Severn, Annapolis, Maryland, according to Maj. Walbach; nor at Fort Washington, Potomac river, below Washington city, according to Maj. Mason.

Maj. Churchill states that at Fort Johnston, Smithville, North Carolina, no unusual meteoric appearances were noted on the evening referred to in the circular, but that no one was particularly engaged in watching for a recurrence of the meteors of 1833.

Maj. Gale reports from Fort Moultrie, Charleston Harbor, that he can find no one in the garrison, or its vicinity, who

has seen any unusual meteoric display since November, 1833; and the report of Lt. Williamson, from Castle Pinckney, in the same harbor, is to the same effect.

Capt. Marchant makes a similar report from Fort Oglethorpe, Savannah, Georgia.

From Fort Marion, St. Augustine, East Florida, Capt. Drane reports that no recurrence of the meteors had been observed, and that no remarkable meteorological occurrence was recorded about the period designated, in November.

No recurrence of the meteors was observed at Fort Jackson, on the river Mississippi, below New-Orleans, commanded by Capt. G. M. Gardiner.

General Atkinson states from Jefferson Barracks, near St. Louis, Missouri, that no occurrence of the sort alluded to in the circular, was observed in the autumn of 1834, by "any one at the post, nor was there such a recurrence any where in the west, as far as [his] inquiries, had extended."

Lieut. Col. Vose reports from Fort Towson, on the Red river, below the mouth of the Kiameche, that no recurrence of the meteors had been observed, as far as he could learn, in the section of the country in which the post is situated.

Col. Dodge, commanding the regiment of dragoons, reports from Fort Leavenworth, on the Missouri river, at the junction of the Little Platt, that no remarkable meteoric phenomenon had occurred since his arrival at the post, on the 27th of September; he adds, that "a recurrence of an event so remarkable as the one mentioned, could not have escaped the notice of the sentinel on post."

From Fort Snelling, Falls of St. Anthony, Upper Mississippi river, Maj. Bliss reports that, from an examination of the sentinels who had been on post during the night of the 12th and 13th of November, he could not learn that any recurrence of the meteoric phenomenon of 1833 had been observed. He gives a particular account of a very bright meteor seen at 5 o'clock, A. M. on the morning of the 9th of January, 1835.

Lieut. Col. Davenport, commanding at Fort Armstrong, Rock Island, Upper Mississippi river, Illinois, states, as the result of information which is satisfactory to him, that no meteoric phenomenon was observed on the 13th of November, 1834, at his post. He gives the temperature at 7 o'clock, A. M. on the 13th of November, as 42° Fah., the wind N. E., and the weather fair.

The reports from Fort Dearborn, Chicago, Illinois, commanded by Maj. Green, and from Fort Winnebago, portage between the Fox and Ouisconsin rivers, N. W. Territory, commanded by Lieut. Col. Cutler, state that no unusual meteoric display was noticed there on the night referred to.

The return from Fort Howard, Menomonieville, Michigan Territory, is of the same purport, General Brooke adding, that there were several apparent shocks of an earthquake in November, 1834, as

evidenced "by a severe rocking of the flag-staff in the night, although it was perfectly calm at the time."

From Fort Mackinac, Straits of Michilimackinac, Michigan Territory, Capt. Clitz reports that he has "made inquiry of the sentinels who were on post on the night of the 13th of November last, and one only, an intelligent young man, who was posted at the north angle of the fort, saw a shower of meteors in the north, between 12 and 1 o'clock, the duration of which, as near as he can recollect, was about one hour."

Maj. Hoffman reports from Fort Gratiot, on the St. Clair river, that no recurrence of the meteoric phenomenon of 1833 was observed at his post.

The returns just given are from eleven posts in the Atlantic States, from Maine to East Florida; from six posts in the Western States, or frontier, and from five on the northern frontier; they agree in stating, with one exception, that no unusual meteoric display was noticed on the night of the 12th, 13th of November, 1834.

It is almost needless to observe, that the military stations are places where observation of any striking meteoric phenomenon may be expected, at least one sentinel being on post, the reliefs being posted by a non-commissioned officer, and the sentinels visited at least once during the night by a commissioned officer. Vigilance is particularly to be expected in our out-posts, from which the reports are quite minute. A local "shower" of meteors was observed by a sentinel at Fort Mackinac, about midnight, and lasting about one hour. Many of the reports do not confine themselves to a statement that no meteoric display was witnessed at the posts, but include inquiries made in the vicinity.

These reports may, I think, be considered conclusive against the occurrence of any extensive and remarkable display of meteors, so far as ordinary observation could have detected such a display.

In reply to letters addressed to friends in different quarters, with a view to ascertain if special observation had been made on the morning of the 13th of November, I received the following information.

At New-York, as I learned from Prof. Renwick, a gentleman well known for his scientific attainments, assisted by a friend, watched the during whole night, but saw no remarkable occurrence of meteors. Doctor Gibbons, of Wilmington, Delaware, observed the heavens, in connexion with his observations on the aurora, until about half-past 12 o'clock on the morning of the 13th of November. He informs me that he has been in the habit of inspecting the heavens, frequently, every clear evening since November, 1833, and has observed, often, an unusual number of meteors, for several evenings in succession, and sometimes the reverse of this. The night of the 12th, 13th of November, 1834, was clear.

No unusual occurrence of meteors was noticed at Baltimore by the city watch, or

\* See Am. Jour. Sc. & Arts, by Prof. Stillman, for January, 1835, p. 335.

others, to whom inquiry was directed by Prof. Ducatell; nor at the University of Virginia; nor at the University of North Carolina; at which places, as I learn from Prof. Patterson, and Prof. E. Mitchell, no special observations were made. At Cincinnati, Ohio, the night was cloudy, with showers.

President Lindsley, of Nashville University, informs me that one of the gentlemen of the University was on the lookout on the night of the 12th, 13th, but saw nothing remarkable.

The direct observations made at New-York, Philadelphia, and Nashville, show that no unusual meteoric display occurred at either of these places; and the general experience at Baltimore, and Wilmington, Delaware, the University of Virginia, and the University of North Carolina, was to the same purport. As far as public testimony through the journals can reach this point, it confirms these conclusions.

I infer that the meteors seen at New-Haven, from one o'clock until daylight, by Prof. Olmsted, and the gentlemen who assisted him; at West Point, after 2, A. M. by Mr. Twining; at Mackinac, between twelve and one o'clock, by the sentinel, were not parts of one meteoric display, visible over an extensive region of country, like the phenomenon of November, 1833, but were local.

It is to be seen from the foregoing statements, that the weather was not the same over the extent of country which they embrace, while on the 13th of November, 1833, there was a most remarkable uniformity over a much greater surface.

Philadelphia, May 28, 1835.

[From the Repertory of Patent Inventions.]

*Specification of the Patent granted to HENRY BOOTH, of Liverpool, for Compositions or Combinations of Materials applicable for the Greasing of the Axle-Bearings of Carriages, and the Axle-Spindles and Bearing-parts of Machinery in general, denominated Patent Axle-Grease and Lubricating-Fluid.*

Mr. Booth says, my patent axle-grease and lubricating-fluid are chemical compounds of oil, tallow, or other grease, and water, effected by means of the admixture of soda or other alkaline substance, in such proportions that the compounds shall not be of a caustic or corrosive nature when applied to iron or steel, but of an unctuous greasy quality, easily fusible with heat, and suitable for greasing the axle-bearings of carriage-wheels, or the axles, spindles, and bearings of machinery in general. And the proportions of the ingredients for the said compounds, and the method of compounding them, which I recommend as suitable for the above purposes, are as follow:—

For the axle-grease suitable for carriage-axles, and particularly for the axles of every description of railway carriages, a solution of soda in water, (the common washing soda of the shops,) in the proportion of half a pound weight of soda to a gallon of pure water; to one

gallon of this solution add three pounds of good clean tallow and six pounds of palm-oil; or, instead of the mixture of tallow and palm-oil, add ten pounds of palm-oil, or eight pounds of tallow, (the tallow being of a stiffer nature than palm-oil.) The said tallow and palm-oil, or either of them, and the solution, as described, must be heated together, in some convenient vessel, to about 200° or 210° of Fahrenheit, and then the whole mass must be well mixed and stirred up together, and be agitated without ceasing till the composition be cooled down to 60° or 70° of Fahrenheit, and have obtained its consistency, which will be that of grease or butter, in which state it will be ready for use, and may be applied in the way in which grease is usually applied to machinery.

For the lubricating-fluid, which, also, is applicable to the rubbing parts of machinery, (and particularly to the spindles of pulleys on inclined planes moving on wooden bearings,) I recommend to be taken of the aforesaid solution of soda in water, one gallon; of rape-oil, one gallon; and of tallow or palm-oil, one quarter of a pound weight: heat them together to 200° or 210° of Fahrenheit, and then let the fluid composition be well stirred about and agitated without intermission till cooled down to 60° or 70°, when it will be of the consistency of cream: or if a thicker consistency be desired, a small addition to the tallow or palm-oil may be admitted; and in all cases it is advantageous to shake or stir up the mixture immediately before using it.

Now, though I have given the foregoing proportions of ingredients, as suitable, under ordinary circumstances, I do not mean to limit the invention to these precise mixtures; as according to the temperature of the weather, or the particular purpose to which it may be applied, a little more tallow or other grease or oil, and less of the solution may be desirable; or slight alterations in the quantity of soda for the solution, or in the relative proportions of tallow and palm-oil or other grease, may be found advantageous—a larger proportion of soda in the solution, and a larger quantity of tallow in proportion to the solution, rendering the compound stiffer, and less easily fusible in hot weather; all which modifications of my patent compounds will be easily adjusted by the superintendents of the machinery to which they may be applied. In witness whereof, &c.  
Enrolled June 4, 1835.

[From the same.]

*Specification of the Patent granted to JOSEPH FERGUSON, of the City of Carlisle, in the County of Cumberland, Manufacturer, for a certain Combination of Processes whereby a new kind of Dress or Finish is given to certain Goods. Sealed December 23, 1834.*

To all to whom these presents shall come, &c. &c. Now know ye, That in compliance with the said proviso, I, the said Joseph Ferguson, do hereby declare the nature of my said invention to consist

in giving a new kind of dress to twilled, plain, or figured cotton goods, which have been beetled by submitting them to certain known processes, not heretofore applied, after beetling, to produce that effect. And in further compliance with the said proviso, I, the said Joseph Ferguson, do hereby describe the said processes and the order in which the same are to be applied, by the following statement thereof, (that is to say):

I take plain, twilled, or figured cotton cloths beetled in the usual way by a beetling-machine for fifty or sixty hours, in order to bring them to a very high gloss, and put them over a damping-machine so as to be completely saturated with water. I then put them through a drying-machine with copper cylinders and heated with steam in the usual way, taking care to put them through, when twilled, as tight as the cloth will bear without tearing, so as to open out the twill as much as possible during the drying process; when the cloths are plain, or figured, only, and not twilled, then the usual degree of tension applied to goods in drying-machines will be sufficient, and in all cases it is preferable that the heat and speed of the drying-machine be such as to dry the cloth completely by the time it gets once through, provided the color, (if dyed goods,) be such as to admit of it, if not, it should be dried at two or more operations.

The stiffening of the goods should in all cases also be particularly attended to, inasmuch as the more firmly they are stiffened, whether before or after beetling, the more defined and perfect will be the dress.

Now whereas I claim as my invention the combination of the damping or saturating and subsequent drying processes with the process heretofore in use to produce beetled goods, as hereinbefore described, and applied to the purpose of giving a new kind of dress or finish to such goods as aforesaid. And such my invention being, to the best of my knowledge and belief, entirely new and never before used within that part of His said Majesty's United Kingdom of Great Britain and Ireland called England, His said dominion of Wales, or town of Berwick-upon-Tweed, I do hereby declare this to be my specification of the same, and that I do verily believe that this my said specification doth comply, in all respects, fully and without reserve or disguise, with the proviso in the said hereinbefore in part recited letters patent contained; whereof I do hereby claim to maintain exclusive right and privilege to my said invention. In witness whereof, &c. Enrolled June 23, 1835.

BUFFALO, Nov. 5th.—NINE STEAMBOATS, and a large number of schooners, left this port on Tuesday, for the West, heavily laden. The tide of emigration, and flood of merchandise to the West, is unprecedented, and scarcely shows a diminution from the thousands, which passed through our city at the opening of navigation, last spring.

A SHIRT IRON STEAMBOAT has been placed on the Erie Canal, and has succeeded admirably, so far as the experiment has been tried. She is propelled at the rate of six miles an hour without causing any injury to the Canal. [Courier and Enq.]

## AGRICULTURE, &amp;c.

*Extract of a Letter from our Correspondent, A. W., dated,*

Lansingburgh, 27th August.

Business calling me to New-York, about the middle of June last, and not having completed it on the first of July, and finding, from appearances, that little could be done, till after the celebration of the Fourth of July, I took the opportunity to make an excursion of two or three days to Philadelphia.

Stepping on board the morning six o'clock boat, I was enabled, by a rapid, but pleasing and changeful travel, by land and water, to reach Philadelphia in time for dinner at the United States Hotel. Some people live to eat, and others eat to live; and as I belong to the latter class, I did not pause my eye on the preparations for dinner in the spirit of a gourmand. I merely noticed the profusion of viands on the table, but I could not help, being a stranger, observing the superiority in good, wholesome, well-baked bread, fresh vegetables, and choice butter.

When dinner was over, I took a walk to the Navy Yard. The first impulse was, of course, to find something new, and worthy of inspection. With very little search, I found an object which answered the purpose. This was the new national ship, *Pennsylvania*, of 140 guns, now on the stocks. It was my good fortune to meet with a gentleman who was probably an officer of some grade, at any rate, I think he was worthy to be one, at least as far as politeness is concerned. He showed me, with an apparent feeling of national pride, every thing connected with it, and answered all my questions, not only with a thorough knowledge of the subject, but with seemingly as much pleasure as I could possibly take in asking them. I took minutes from some of his answers, and among the principal ones I find the extreme length of the ship is 217 feet, its greatest breadth 50 feet, and its depth, amidships, 51 feet. But as naval architecture is not my object, though I took several other notes, I will not tax the printer nor the reader with them. As I had another use for the remaining part of the afternoon, I took a rather painful leave of my interesting guide, reflecting, at the same time, with what wonderful accuracy the sweet and bitter of life are balanced; for the extreme pleasure I took with this momentary acquaintance, was exactly balanced by the pain of parting.

I now steered my course to Washington Square, a fine specimen of taste and liberality. It is situated in the southeasterly part of the city, and I was told that it contains about eight acres. It is beautifully laid out, and planted with ornamental trees, selected from various parts of the world, but, as they should be, mostly natives of our own continent; for certainly, while the Eastern Continent can boast of its ancient ruins, its broken columns, and relics of the

arts of other days, now trodden under foot, and crumbling into dust, the proper field, in which to search for the beauties of nature, and to explore her inmost recesses, will be found in the forests of America. The sun was now descending far in the west, and its light striking in bold relief on the trees and flowers, and reflected from different shades of green, presented a scene beautiful beyond description.

The city contains several other spacious and beautiful squares, but I had not time to visit them. Why is it that our other cities and villages are destitute of these delightful appendages? No reason can be given, but that they were laid out, as we know was the case in the early settlement in our own State, without any plan at all, or the ground has been seized on, and sold in speculation, to gratify the sordid views of forestallers.

When thirst of gold enslaves the mind,  
And selfish views alone bear away;

every nobler feeling—every spark of laudable national pride vanishes, as colors vanish when light is withdrawn.

The dusk of evening was closing around me, and I returned to my lodgings. The day's exercise had given me an appetite for a wholesome supper, and a night of quiet repose, both of which were duly enjoyed.

At daylight next morning, I took a stroll through the market, and was soon convinced that its celebrity was justly merited. The building and accommodations were in themselves highly worthy of notice. Stretched nearly a mile in length, through the middle of a wide avenue, which is a great thoroughfare through the centre of the city, from one river to the other; and forming, on each side of it, a street of convenient width. Its plan, for beauty and convenience, could scarcely be improved. But to give an idea of the contents of this market, all I can say, from so short an inspection is, it contains samples of every thing which ever was, or can be exhibited for sale in a public market. The meats in general were fine, but the mutton, in particular, surpassed any display of that article I have ever seen. The butter was exhibited in a style of neatness and taste, which would draw tears of pleasure in the eyes of an Epicure. But it was not these more prominent articles only which attracted attention; every thing the eye could recognize, animal, vegetable, mineral, or fossil—natural or artificial, was there, and all so tastefully arranged, that the smallest article seemed to say, examine me too; while the choice fruits, flowers, and fresh vegetables, whispered, with more conscious dignity, here you may see the effect of liberal premiums from the Pennsylvania Horticultural Society.

After breakfast, taking all the rest of the day before me, I set out to view the gardens, water-works, &c.; and, taking a hackney coach, my first course was steered to Bartram's Garden and Nursery. These are situated on the west bank of the Schuyl-

kill, about three miles from the city, and are now owned, and judiciously managed, by Mr. Robert Carr, the son-in-law of Mr. Bartram, who is well known as a botanist and naturalist; and his very superior collection of North American trees and plants, show him in the very pleasing light of being truly national.

On a stone over one entrance to the house, I noticed the date of 1781, rather roughly but plainly cut. On inquiring, I found that this front of the mansion was built at that period; and another inscription, purporting to have been cut 39 years afterwards, reads and spells thus:

"It is god alone almyty lord  
The holy one by me adored.

"JOHN BARTRAM, 1770."

The garden, it is said, was commenced about four years before the date of the first inscription, and is now about 114 years old. I was informed that Mr. Bartram and his son must have been about 100 years in collecting this valuable legacy they have left to the Flora of North America. A small strip of land, containing less than seven acres, was said to contain rising 2,000 species, natives of our own country. But I found also a no less rich treat in examining the exotics, which were very numerous and valuable. The collection of Camillas and tropical plants, surpassed any thing of the kind I had ever seen; among the latter were some fine specimens of *Zamia*, *Ficus*, *Euphorbia*, *Heterophylla*, &c. The grounds were tastefully laid out, and besides the amazing variety of smaller trees and shrubs, arranged, apparently, to the best possible advantage, the effect is still heightened by the grandeur of several trees, majestically towering above, and overspreading the rest: among which are a Norway Spruce, at least 80 feet high; a Cypress, (*Cupressus disticha*), 25 feet 6 inches in circumference, and 114 feet high; native *Magnolias*, Flowering *Acacias*, &c. And beneath this lofty display of variegated foliage, on proper fixtures, I noticed a magnificent Sago Palm, the circumference of its foliage 24 feet, and the stem 3½ feet. But it is vain to attempt enumeration, when the bare catalogue would four times exceed my limits.

Between this beautiful and magnificent grove and the Schuylkill, are several fishponds, with gold and silver fish and aquatic plants; and still farther on, towards the river, is an ancient cider-mill, cut, with great labor, out of the solid rock, near which was a small plot of Gama grass. From the numerous accounts of the productiveness of this grass at the south, particularly in North and South Carolina, it must be found a good substitute for clover, herds grass, &c. &c., and its introduction of great importance to that section of our republic. But from an examination with some of it, raised in my garden, and also the opinion of Mr. Carr, who has had it on his grounds a dozen years, I am led to con-

clude it will be of no great value to our northern farmers. The vines and fruit nurseries were extensive, and appeared in perfect keeping with the rest of this splendid establishment.

Nor was this display of nature more pleasing than the polite attention of its worthy proprietor, who not only answered, with apparent pleasure, all my questions, which, to say the least, extended to the utmost bounds of civility, but showed me many deeply interesting curiosities, and, among other things, his extensive and valuable library, principally on Agriculture, Horticulture, and Botany, which seemed to say,

"Come, let me make a sunny realm around thee,  
Of thought and beauty! Here are books and flowers."

Leaving this place with reluctance, I steered my course to Lemon Hill, which is the name very appropriately given to the pleasure grounds of Mr. Henry Pratt. It is situated in the immediate vicinity of the grand Water-works, and is said to contain over twenty acres. Nature seems to have displayed her utmost power in modelling this charming situation, leaving but little for art to accomplish, to render it one of the most delightful spots on earth; and art, with such a bold and lovely model, appears to have availed herself of every advantage, to beautify and complete what Nature had so happily begun.

The mansion is placed on an eminence, commanding a delightful view of the Schuylkill, just at that point where every thing is in pleasant motion. The busy neighborhood of Fairmount, the interesting views of this fine landscape, are fully kept before the eye, by gently winding paths, through a rich and well kept grass plot; every turn producing some new and pleasing effect. The foot does not tread in the same path which the eye has gone over before. The groups of lofty trees, so advantageously placed on the hill, near the house, with their deep green foliage, form a beautiful contrast with those of more light and stunted growth, situated in front of the ground bordering on the water; thereby adding much to the effect, by seeming to remove the perspective to the farthest extremity of the picture. The numerous well stocked fishponds, with their islands and aquatic productions, summer-houses, gardens, porters' and laborers' lodges, all well placed for picturesque effect; and the beautiful little grotto, thrown so chastely over the mineral spring, all conspire to complete the beauty and variety, without, in the least, marring the productions of nature, so very interesting in the immediate vicinity. The spacious green hot houses, with their numerous and lovely tenants, spread far and wide in every direction, making the whole garden a repository of flowers and fragrances, certainly stand prominent in their kind; and as we migrate along the well kept gravel walks, so richly adorned by tree, shrub, and plant, of every shade and shape, and from every

climate, intermixed with the inmates of the green house, the shaddock, orange, citron, lime, the fig tree, laden with inviting fruit; the sugar cane, pepper tree, banana, guava, and plantain; the cheremalla, mango, and splendid cactus; a reflecting mind must be lost in admiration, not knowing which most to admire, the amazing variety produced by nature, or the wealth, liberality, and taste, which have planted and sustain them there.

As I cast a valedictory glance at this enchanting scenery, the power of association brought forcibly to my mind the slighted and neglected talents of my worthy friend Perrine, whose whole soul is compounded of botanical science and horticultural taste. Had the magnanimity of our wise National Legislature been sufficient to have granted his petition, for a few acres of wild, and, probably for a long time to come, worthless land, on the peninsula of Florida, and the little pecuniary aid, to which every sensible man in the nation would have been proud of contributing, to enable him to establish a national repository, for the introduction and acclimation of exotic plants, he would ere now have exhibited all the beauties and rich treasures of the vegetable world, flourishing in high exuberance, without the expensive aid of artificial heat. One half of the amount, which the patriotic and noble spirited proprietor of this establishment has expended, from his own purse, would have accomplished his object in a manner highly creditable to the nation, and profitable to the present and future generations. But public bodies, like corporate bodies, have no souls.

But I found the plan of my pleasing excursion, as I now find that of my letter, extended beyond the bounds to which circumstances limit its accomplishment; and I had then, as I have now, to quit the subject almost at the beginning. You know my attachment to the subject of horticulture, and you know there is nothing else so pleasing to me, except the cultivation of the human mind. But here I had both the subjects before me; one, in the situation I have so faintly described, and the other, in the more than pleasing urbanity and politeness of its proprietor, either of which, to say the least, I never saw excelled. I have ever been of the opinion, that a spirit to relish, and taste to direct horticultural improvements, is commensurately an evidence of an amiable and philanthropic disposition; and, if proof were wanting, I found it amply displayed, in the kind attention, which, as a stranger, I received, not only from Mr. Pratt, but from his principal gardener.

The day was now far spent, and I had only time to take a slight glance at the water-works. As I am not familiar with the subject of mechanics, and if I were, I had now no time for

Examining with care each wondrous matter  
That brought up water."

I can only say, of the whole, it is a stupendous establishment. But there was a peculiar charm to me in the reservoir on the hill, consisting of three beautiful sheets of water, and a fourth in operation.

The time I had allotted for my stay was nearly exhausted, and I had examined but two of the gardens, of which I had procured a long list. I had promised myself the pleasure of visiting Mr. Parker's Botanic Garden, Mr. McArran's Botanic Garden and Nursery, Mr. Hibbert's Nursery, Messrs. Landreth's Nursery, and others of equal celebrity; but the imperious call of business compelled me to forego the pleasure, and it being now Saturday night, I returned to my lodgings.

On Sunday morning I attended Church. But in the afternoon, as an exercise not altogether unappropriate for the day, I visited Rolinsan Rural Cemetery. This is a place which, though no person of common sense could leisurely enter with feelings of levity, yet no reflecting mind could spend a few moments' contemplation in it, without experiencing emotions of exquisitely pleasing satisfaction, though still partaking of a sober seriousness nearly bordering on melancholy.

This place contains  $2\frac{1}{2}$  acres. It was commenced in 1827, and now contains between 4 and 5000 interments, and about 100 vaults. When it was first commenced a lot about 10 by 8 feet sold for \$40, but will now command from \$90 to \$100. An adult stranger can be buried for \$8, and a child for \$4, including opening and closing the grave.

The place is inclosed on three sides with a handsome stone wall, and the front side with an iron railing. On the right hand of the entrance is a dwelling for the attendants to the concern, where they are at all times to be found. On the left is a green house, with rooms over it for meetings of the lot-holders and managers.

The plants in the green house are for the purpose of ornamenting graves, at proper seasons; and hardy flowers in great variety are growing, tastefully and liberally scattered over the ground.

Among the various and numerous monuments, some were of peculiar elegance. I noticed one, on which the inscription stated that it was executed in Italy. It was of exquisite material and workmanship, and I could not help admiring the skill in the fine arts peculiar to that country; but looking a little farther, I was most agreeably astonished to find one executed in Philadelphia, quite surpassing it; I could not but indulge some feelings of pride in reflecting on the amazing improvement since 30 years ago, when similar monuments were ornamented with an awful staring death's head and marrow bones.

Among the interments I noticed that of a Chinese, aged 37, buried in 1830. Part of

the inscription was in the Chinese character.

I could not view this interesting spot without painful reflections, on what appears to me the unpardonable want of similar institutions in the great and opulent State in which I live. Can it be from a want of social affection in the people in this state, or can it be from feelings of parsimony, that we grudge the expense, that we suffer our friends to be put under the turf to-day, and the place of their rest broken up and perhaps appropriated to some other use to-morrow? The Corporation of your city are selected for their supposed fitness, and are duly authorised and empowered to manage and direct all affairs of public interest; and is it not a duty they owe to protect the public feelings, from what must be daily suffered by persons who cherish with tender affection the memory of their deceased friend, when they see the place of their remains turned into a common highway, or perhaps dug up, and their bones scattered and trodden into dust?

This is naturally a public concern; but if it does not soon receive the attention the importance of the case demands, it will pass into the hands of private speculation, from which it would be difficult to return it to its proper channel, and which would place it in a state truly to be deplored by every person whose heart is warmed by a spark of philanthropy or patriotism. But to return.

On Monday morning I left Philadelphia, and I can truly say, I never spent three days in more pleasing gratification. Getting on board the steamboat, I lost much of the beauty of the scenery on the way to Trenton, by accidentally taking up part of a number which I had not seen before, of a new and beautiful little periodical entitled the *Zodiac*: it so completely engrossed my attention, that I saw nothing else till I had finished perusing it, just as we arrived at Trenton.

As natural history is in some measure my hobby, of course my attention was particularly occupied by the *Naturalist's* book, in which I was confident I recognized the pen of my esteemed friend Doct. —, and I determined to patronize the *Zodiac* at my return.

A. W.

*To our Agriculturalists.* By W. P. [For the *New-York Farmer*, and *American Gardener's Magazine*.]

Foreigners, the least conversant with the grades of society in Europe, are much surprised at the low social estimation of the agriculturalists of this country. In every part of the civilized world, excepting this, they are ranked among the foremost in public opinion; here, every petty shopkeeper is considered their superior. There are many exceptions to this rule, but as a class it will be admitted to be correct.

There must be something radically wrong in the self-estimation of our farmers, or such an inverted state of their esteemed

condition could not exist. To endeavor to induce them to make a fair estimate of themselves, is the object of this essay. I will attempt to show them why, as a class, they ought to rank at least as high as any other, and then point out to them why they now rank so much lower in public opinion than those of the same class in other countries. I have no wish to increase their pride, for man has nothing to be proud of; besides, pride, as the term is generally understood, is a mean, groveling quality, exactly adverse to a fair appreciation of ourselves in our social capacity.

The fact, that the cultivators of the soil are the primary producers of the whole wealth of a country, is of itself sufficient proof of their superiority as a class. This fact will no doubt be denied by many of our dealers and shopmen, who are incapable of tracing effects to causes, and who, wrapt in self-conceit, have assumed a station that does not belong to them. The fact, however, can be easily demonstrated, which I shall endeavor to do in as succinct and plain a manner as possible.

We have about two millions of families, including farm laborers, employed in agricultural and horticultural pursuits. This estimate may be considered excessive, for there may be less than two thirds of our whole population engaged in cultivating the soil; but however much beyond the reality, it alters the conclusion to be drawn from the premises only in diminishing the amount put in circulation annually, not in its inductive facts. We will suppose that the land under cultivation affords no surplus beyond the support, in the first necessities of life, to those employed in cultivating it. It is evident, in this case, that the farmers having nothing to sell, would be unable to purchase any thing; that every individual of our population would be compelled to cultivate the soil to obtain an existence, for there would be neither sellers nor purchasers. We will further suppose that the average surplus of each family, beyond their own existence, to be fifty dollars per annum, and that the whole of this were wanting to supply agricultural instruments. The amount to be expended would now be one hundred millions of dollars per annum, which would put into operation a given number of workmen in wood and iron, as well as a small number of dealers to facilitate the receiving and executing of orders. Trade has now commenced, but never could have started but for the farmers' surplus. If the average surplus of each agricultural family should be one thousand dollars, an estimate probably very near the truth, and the greater portion of this surplus be expended in the usual variety of objects which go to promote the comfort and luxury of families, it is evident, that in addition to the workers in wood and iron, there would be put in operation builders, cabinet makers, clothiers, and a thousand other sources of industry.

If, when these agents have accumulated capital, and by this means extended their operations so as to meet the increasing demand of the agriculturalists, shall pride themselves on a factitious superiority, forgetting in toto the source of their wealth,

ought they not to be pitied rather than admired by the intelligent part of community?

The amount put in circulation by our farmers, on the last estimate, would be two thousand millions of dollars per annum, and the number of workmen and agents employed to execute orders would be vastly increased. The whole capital accumulated by the country is exactly the amount saved out of this surplus, by the farmers, and the agents and workmen employed by them.

That our farmers should have a surplus of two thousand millions of dollars per annum, over and above feeding their families, would appear, at first sight, to be much overrated; but after deducting four hundred millions for the wages of workmen, and three hundred for buying and planting new farms, building houses and barns, buying new instruments of agriculture and repairing old ones, we shall find that it leaves but about eighty-five dollars per head for our whole population for clothing, furnishing, and other necessities and comforts sought by those who can afford to purchase them. It should also be recollected that five millions of our population derive all their necessities, comforts, and luxuries, from this surplus, and that the annual accumulation of capital is a product of that excess.

So long as there is land in a country of first and second rate qualities, for the creation of new farms, so long can this primary source of wealth be extended. There is also ample room in this country for a great extension from the land now under cultivation, as at least one third more product could be raised from it than is now produced; but as this consummation cannot possibly take place until interest of money and wages are lower, or new labor saving machines shall be invented, we must hope rather than expect to see it realized in our day.

Manufacturers, dealers, and shopmen, and, in fact, all who are not laboring on farms, derive their whole support from this agricultural surplus. The capital, accumulated by those agents who buy and sell, whether merchants, shopkeepers, or dealers in any commodity, being savings from the varied circulation of said product, the farmers ought surely to be entitled to their highest consideration.

This surplus is by no means stationary, and the prosperity of some years, as well as the depression of others, are the results, in the greater number of instances, of the greater or smaller surpluses. If the surplus one year should be twelve hundred millions of dollars, another seventeen hundred millions, and another twenty-two hundred, it would be easy to account for the elevations and depressions in the business community of the country. In fact, the variations which annually take place in these surpluses is the only true barometer of a country's prosperity.

When merchants, manufacturers, and dealers in a country are operating with large masses of capital, the accumulation of many years, concentrated in cities and towns, they lose sight altogether of the original source of wealth. And where the right of primogeniture does not exist, as in this country, to enable agriculturalists to

concentrate their property in the heads of families, the other classes will, apparently, be much richer, and claim a superiority. Their riches, however, is only *apparent*; for the far greater portion of wealth in every country must ever remain with the owners of the soil. Much of the capital wielded by dealers is altogether fictitious, being predicated on credit, and a considerable share of their more solid capital is borrowed from the savings of property owners.

Let me ask our farmers why it is, with so many solid claims to superiority, that as a class they tacitly acknowledge themselves inferior to those who are their dependents? I need bring forward but one circumstance to prove the fact. When our farmers have a son they consider more than usually talented, do they not bestow a better education on him, with a view to settle him with some merchant or dealer in our cities or towns, and this with the fearful odds against them of his being ruined in pocket, mind, and body, as is the fatal issue with three fourths of the whole number? This is plainly acknowledging that it requires more talent and a better education to make a dealer and shopman than it does to make a farmer, and this depreciated view of their own condition is the main cause of their being undervalued by the community in general.

There is no business or profession, in the whole circle of human pursuits, that requires more solid talent to execute well than that of cultivating the soil, and there is no class of our citizens whose education is so generally neglected. It is too generally considered that to learn to plough, harrow, sow, drill, and plant; to harvest well when crops are ripe, and sell when ready for market, are all the qualities necessary for a farmer, with the addition of a little cyphering and writing. These, it is true, are necessary qualifications for every man who has the management of a farm; but they are by no means all that are requisite to make the pursuit yield its greatest degree of profit, and sufficiently interesting to attach the most enterprising and talented of its sons to the calling. If the owners of the soil are desirous of acquiring wealth, and at the same time that degree of respectability which will make them respect themselves as a class, they must acquire far more knowledge than the mere drudgery of a farm. They should know practically how to perform every branch of labor, in order to understand when their workmen do them justice; but the pursuit must indeed be miserably unproductive and uninviting if the owner of the estate cannot make more by systematizing his business, and superintending the carrying out of the system, than by personal labor. They should understand mensuration sufficiently to be able to calculate the quantity of land after the chain has been run; the advantages of draining, with the most effective and most economical way of operating; the properties of different soils, including a knowledge of what seeds and plants are most productive in each, with a critical judgment of the manures or composts best adapted to different qualities of soil; sufficient of botany to enable them to judge of

seeds, plants, and fruit trees, with the best mode of producing them in the greatest abundance and in the highest degree of perfection.

It will not be denied that to acquire such knowledge would be highly advantageous to our agriculturalists, and not only to them as a class, but to the general community, for the average of the farming surplus would become so much larger as to materially benefit the whole mass. But, say they, how is this knowledge to be acquired? neither our common schools, academies, nor colleges, give any such instruction, therefore we have not the means of acquiring it. This objection is too true, and is a truth highly disgraceful to the enlightened age in which we live. The means of acquiring an agricultural education ought immediately to be put within the reach of this our most valuable class of citizens. In every college there are professorships for physic, law, and divinity, but none for that class on which our prosperity and very existence depends. Agricultural schools, academies, and colleges, with experimental farms attached to each, and with such professors as are requisite for the scientific departments, cannot be too soon established. The expense of such establishments would be repaid a hundred fold during the existence of the rising generation. A farmer should learn arithmetic, mensuration, agricultural chemistry, mineralogy, geology, and the physiology of seeds, plants, trees, and animals. A certain portion of his time should be appropriated to acquiring scientific knowledge, the remainder to practical operations of scientific principles. The expense of such an education should be as moderate as possible, particularly in the commencement so low, as to induce those who have but little to spare for education, to send their sons to such establishments, in preference to any others, on the score of expense alone.

With such an education, our farmers, instead of looking to other pursuits for their most talented sons, would feel it a degradation to place them any where but on the soil. Their sons, too, finding agriculture the most exalted of human employments, would be proud of their calling. That time of the year in which they are most unemployed, in place of hanging heavy on their hands, would be appropriated to improving their minds. They would as a class stand boldly prominent in the front ranks of society, and instead of any feeling of inferiority, as is now too much the case, would be able justly to consider themselves on a perfect equality with the best of any class; and that ignorant flippancy they now so much admire in others, would be found hollow and disgustingly nauseous. Politically they would become truly independent, and in place of being the tools of designing political knaves, they would have intelligence to enable them to think justly on every political subject, and manhood to back their opinion. But the most exalted of all considerations would be the effect on their moral condition individually. They would not only be able to appreciate themselves and their pursuit fairly, as a class of the human family, but in the investigation of the wonderful arrangement in the order

of nature, they would feel that man was a being of exceedingly limited powers, that his utmost scope was as nothing in the presence of Him whose infinite mind had arranged, and whose infinite power had executed the wonderful works of creation. In possession of a physiological knowledge of the construction of seeds, plants, and trees, with the adaptation of soils to their growth and maturity, their contemplations would open to them a nearer approximation to the Divine Mind, and whether in the field or their chambers, they would enjoy this greatest and most durable of all sources of human happiness, that they were never "less alone than when alone." W. P.

W. P. will not leave the subject, we trust, which he seems so well to understand, with a single communication. Our columns will always be open to such communications.—[PROP. N. Y. F.]

To the Honorable Louis McLane, Secretary of State of the U. S. A., Washington City.

CONSULATE U. S. A., CAMPECHE, }  
February 1st, 1834.

Sir,—The subscriber now presents a brief recapitulation of some facts and arguments, in favor of the *immediate* domestication of Tropical Plants, in the United States. He wishes thus to show, not merely that the cultivation of tropical staples is *practicable* in our Territory,—but also, that it is absolutely *necessary* for home consumption,—is positively *profitable* for the foreign market, and is highly *desirable*, in other respects, to promote the peace and prosperity of the Union.

The *practicability* of cultivating tropical productions in general, he has manifested with the facts, that the peculiar climate of the tropics extends beyond the astronomical boundary, several degrees north, into our peninsular territory; and that the best plants of the tropics are actually flourishing in the southern portion of that Peninsula, at Cape Florida. He has not only shown that, below 28°, Southern Florida enjoys the dry warm winter—the wet refreshing summer—the breeze by day from the sea, and by night from the land,—and the trade winds from the east, which are *common* to tropical countries in general; but he has also proved, by its narrow level surface stretching southwardly,—by the hot ocean river running northwardly, along its eastern shores,—and by the greater steadiness of the westwardly wind in those latitudes, that Tropical Florida is even *superior* to the elevated Islands of the West Indies, and to the broad Peninsula of Yucatan, in that *uniformity of temperature*, which is most favorable for vegetable growths, animal health, and physical enjoyment. He has moreover not merely shown that in this superior climate of the tropics, are already growing various common vegetables of the tropics, but he has further announced the flourishing condition of the tenderest, and yet most productive plants of the torrid zone,—the Banana plant, and the Cocoa palm, which are universally pronounced to be the greatest blessings of Providence to man; and

northern Atlantic States cannot well compensate themselves, for the superior productiveness of the western States in corn and wheat, by cultivating the vine and the mulberry; and that hence many are forced to become manufacturers and mariners; but it is very certain that the planters of the warm southern Atlantic States can more than compensate themselves, for the superior productiveness of the southwestern States in rice, tobacco and cotton, by cultivating the cassave jatropha, the cochineal cactus, and the henequen agave; and that the sugar palm on the poorest soils of Georgia, will be more profitable than the sugar cane on the richest loams of Louisiana. As we possess all the soils and climate, with the best people and institutions of the world, we have neither the necessity, nor the desire, nor the power of European agriculturists to force the production of similar plants, in inferior climates and on inferior soils. On the contrary, an American cultivator must select the naturally most productive soil and climate for a given plant, or the naturally most productive plant for a given climate and soil. Hitherto our agriculturists have preferred changing the place of location to varying the object of cultivation; and hence the fertile valley of the Ohio and Mississippi furnishes the cheapest and most abundant supply of our present staples, both for the domestic and foreign market. Although the only formidable rivals of our western and southwestern cultivators, *are themselves*, they have already reached the extreme of over production for foreign consumption. Our southern planters, on their inferior soils, cannot hence any longer continue the profitable production of similar staples: and by augmenting the number and capital of southwestern planters, they only injure the latter without benefitting themselves. They must, therefore, seek new staples of cultivation in the naturally most productive plants for their reputed barren soils. Rich and poor, fertile and sterile, are only relative epithets in their application to agriculture; and hence the poorest soils for rice and cotton, may be the richest soils for cassave and henequen, and the most sterile soils for the tobacco plant and the sugar cane, may be the most fertile soils for the cochineal cactus and the sugar palm. "Palm sugar, not cane sugar, supplies the great consumption of the people of the East Indies, in the poorer and more mountainous countries." "As the palms are the produce of poor soils, and the labor is so small and the quantity of saccharine matter from them so great, that palm sugar is produced at about half the cost of cane sugar, of the same degree of purity,—that is, for something less than one penny per pound."

Our present tropical staples require a costly, troublesome cultivation; demand a thick vegetable mould; and impoverish the richest soils in which they are planted.

But the future tropical staples of the south will need only a cheap, simple cultivation; will content themselves with bare sandy earth; and will actually enrich the poorest surfaces on which they spontaneously grow. And as our tropical

rice, tobacco, and cotton, on equal soils, are absolutely more productive than in their native climates, we may confidently anticipate that our southern States will enjoy an equal superiority in the culture of tropical cassave, cochineal, and henequen.

Reciprocal prosperity being thus restored, our southern brethren will cease to calculate the value of the Union.

The possibility of employing the voluntary labor of our white citizens in tropical agriculture, becomes especially important, from the consideration, that the United States embrace the only portion of the world in which the best laborers and the best institutions can be combined, in the cultivation of tropical productions.

The neighboring mis-called Republics contain four times as many Indian as white citizens; the latter are the least productive variety of the white race, and their governments are mere military anachies. The neighboring distracted Colonies contain a majority of negroes, who, when freed, will expel the whites; and thenceforward, like their Haytian predecessors, they will be productive alone in the propagation of their species. Tropical Asia and Africa cannot endure white laborers, nor free institutions; and Europe has not any tropical climate into which her white laborers can extend.—But our Southern States contain already a respectable number of white laborers; and in Florida they will probably outnumber the negro laborers. The slave States, in their own time and manner, will eventually emancipate and transport all their colored laborers; and we shall then present to the world, the only possible example of tropical staples created by the most productive species of mankind, under the most favorable form of government on earth.

The additional considerations derived from the climate and position of South Florida, embrace the retention within our borders of those fellow citizens who annually leave it to locate themselves or to perish in foreign countries. Texas and Cuba are constantly attracting our agriculturists, who soon sorrow for the happy institutions of their Fatherland, and who will return when the existence of a superior tropical climate in Southern Florida shall become generally known.

The south of France and of Italy have hitherto invited our invalids to perish in the great vicissitudes of their changeable climates, but hereafter they will seek for health in the unrivaled uniformity of temperature, and advantages of position, presented by the tropical extremity of our Peninsula.

Our moral obligations to improve the condition of our country are based on the unparalleled combination of advantages with which it has been favored by Providence. With the most favorable form of government, and the most productive varieties of the best species of the human race, we have all the soils and climates of the earth; and the consequent ability to cultivate most profitably all the most valuable varieties of the best species of the vegetable race. It hence becomes our

duty to combine within our territory the creation of the greatest possible amount and variety of cultivated vegetable products for the physical enjoyment, not merely of our own citizens, but also of the inhabitants of all extra-tropical countries, and probably even of the natives of the torrid zone itself. It has been demonstrated, that with a natural equality of soil in even our extra-tropical climates, our slave labor can create cultivated tropical products much more abundantly and cheaply than either the free or slave labor of the colored natives of inter-tropical countries; that many articles of tropical, culture instead of deteriorating, become more productive beyond their native zone; that we may ultimately apply the still more productive free labor of our white citizens to the cultivation of tropical staples; and that such laborers, under such institutions, cannot be devoted to tropical agriculture in any other part of the world. The great equatorial current of the ocean, after cutting off New-Holland from Asia, wearing its way round southern Africa, and being reflected by tropical America, brings to our shores, under the name of the Gulf Stream, the accumulated heat of the torrid zone to encourage our cultivation of the valuable vegetables of that unproducing belt of the globe. The white population on its borders will soon be forced to embark on its bosom for the United States. Once entirely abandoned by the skill and capital of the white species, the colored species will not furnish an adequate quantity of even uncultivated products for extra-tropical consumption. Even logwood, mahogany, and other wild materials for the arts, are diminishing every day. The Peruvian bark, sarsaparilla, and other spontaneous medicines, are also vanishing, and noxious substitutes are exported to kill, instead of cure, our fellow citizens. If, therefore, we do not speedily naturalize all useful tropical plants in tropical Florida, they will soon disappear from the surface of the world.

I have the honor to be, Sir,

Your obedient servant,

HENRY FERRINE.

To the Honorable Louis McLane, Secretary of State of the U. S. A., Washington City.

CONSULATE U. S. A., CAMPECHE, }  
February 20th, 1855. }

Sir,—As an appendix to his communication of the 1st inst., the subscriber avails himself of the only statistical data in his power to demonstrate the greatly superior productiveness of slave labor in the United States over slave labor in the West Indies.

British West India Colonies, 692,700 slaves, 427,392,000 sugar, and 19,769,500 coffee exported.

Spanish Island of Cuba, 286,942 slaves, 162,703,425 sugar, and 42,971,625 coffee exported.

Louisiana, 109,631 slaves, 70,000,000 sugar, and 72,000,000 cotton exported.

Now, admitting for a moment that the culture of cotton is merely equal to the culture of sugar and coffee, as 109,631 slaves produce 142 millions of sugar and cotton in Louisiana, in the same proportion, 692,700 should produce 1,420 millions.

of sugar and coffee in the British West India Islands: and in the same manner, 286,942 slaves should produce 371 millions of sugar and coffee in Cuba.

But the former do produce only 447 millions, and the latter only 205 millions, together 692 millions, instead of the 1268 millions which they should produce in proportion to Louisiana. But the truth is, that the relative value of labor of the production of cotton is at least fifty per cent. more than the value or labor of the production either of sugar or coffee; and hence the combined 979,642 slaves of British W. I. Islands and of Cuba, should yield 1590 millions! instead of 672 millions of sugar and coffee, every year, for exportation; or in other words, with an equal number of slaves, Louisiana would supply the consumption of the world!!

To obtain the details of the relative productiveness of a single negro, the following estimates are presented of a sugar plantation in Louisiana, and of a sugar plantation in Cuba, each assumed to yield annually 400,000 pounds of sugar.

The first are contained in the report of the Agricultural Committee of Baton Rouge to the Secretary of the Treasury, against the reduction of duties on imported sugar, and must hence be presumed to present the most unfavorable aspect of the cultivation of sugar in Louisiana. The second is taken from pages 108-9 of the Statistical History of Cuba, by Dr. Ramon de la Sagra, who presents the most favorable aspect of the cultivation in general of the staples of that Island. The first diminishes the average product of an acre in Louisiana, to 1000 pounds of sugar. The second exaggerates the average product of an acre in Cuba, to 2038 pounds of sugar,—although he had previously admitted that Humboldt was correct in limiting it to 1116 pounds the acre, or 1500 arrobas the caballeria.

The Louisiana plantation is stated 1200 acres—\$50,000; improvements—\$50,000; negroes 80, at \$600 each,—\$48,000; total 148,000 dollars.

The Cuba plantation is allowed only 30 caballerias, or 981 acres,—\$54,000; improvements—\$65,490; negroes, 90, at \$400 each,—\$36,000; total 155,490 dollars.

Of the Louisiana plantation, one third, or 400 acres, is cultivated—giving to each negro 5 acres, and 5000 pounds product in sugar.

Of the Cuba plantation, one sixth, or 196½ acres, is cultivated, giving to each negro 2½ acres, and 4444½ pounds product in sugar, i. e. 555½ pounds less.

The proportion of the annual expenses of the whole plantation is, for the negro in Louisiana, only 105 dollars,—while for the negro in Cuba, it ascends to 151½ dollars; i. e. 46½ dollars more.

Hence, although the slave in Cuba may cost 50 per cent. less, and the ground he works may produce upwards of 100 per cent. more, the slave in Louisiana, both positively in sugar and negatively in money, may gain for his master upwards of 100 per cent. more!!

Without reference to the price of the sugar, or of the coffee, or of the cotton, it may, in the same way, be shown, that

on inferior soils even our slave labor will create much greater quantities at much less expense!! But when we admit the soil and climate to be equally productive, how infinitely superior are the products of American skill, capital and economy, combined; and when we still further contemplate the greater productiveness of most articles of tropical culture, acclimated within our territory, we may safely anticipate that within twenty years, the southernmost sections of our Union will yield every tropical staple for the consumption of even the torrid zone itself.

I have the honor to be, very respectfully,  
sir, your humble and ob't serv't,  
HENRY PERRINE.

#### RAILROAD IRON.

Sealed Proposals will be received at the Office of the Engineer of the Georgia Railroad, until the 30th of November next, for delivering, at the city of Savannah or Charleston, as soon thereafter as practicable, 1500 tons of Railroad Iron, in bars 2½ inches wide by 3½ths of an inch thick, and from 14 to 18 feet long—with the ends scarfed at an angle of 45 deg. The bars must be pierced with holes 5-16ths of an inch in diameter, counter sunk, and 15 or 16 inches apart from centre to centre.

J. EDGAR THOMSON,  
Civil Engineer.

Engineer's Office, Augusta, Geo. }  
October 26th, 1835. } 46-3t.

#### JAMES RIVER AND KANAWHA CANAL, VIRGINIA.

##### NOTICE TO CONTRACTORS.

THE Board of Directors of the James River and Kanawha Company, having resolved to place under contract seventy-three miles of the line of their improvement, viz: All that part extending from the water works dam at Lynchburg, to the end of section No. 118, in the village of Scottsville, and the thirteen miles between the Seven-Island Falls, and the village of Columbia—

Sealed proposals will be received by the Secretary of the Company, at their office in the city of Richmond, from November 18th, to December 7th, inclusive, for all the excavation, embankment and walling in that distance.

The portion of the line which it is intended to let, comprises many difficult points, and a considerable amount of river walling and blasting.

The line will be prepared for examination by the 18th of November; after which date, up to the time of letting, all needful information will be given, and the maps and profiles exhibited to contractors, on application being made to either of the Principal Assistant Engineers, Simon W. Wright, in the village of Carterville, Daniel Livermore, a Scottsville, and Charles Ellet, Jr., in the town of Lynchburg.

It is expected that the proposals of contractors who are not personally known to either of the Assistant Engineers, will be accompanied by proper testimonials of character and experience, from the Engineers of other works on which they have been engaged.

The seals of the proposals will be broken on the 10th of December, and the acceptance of the propositions by the Board, made known as soon after, as will be practicable. By order of the President and Directors

W. B. CHITTENDEN, Secretary.

Note—This advertisement is not intended to embrace the Locks, Dams, Culverts, or any other of the works of art—Prior to the letting of which, as well as of the residue of the excavation and embankment between Scottsville and Maiden's Adventure, due notice will be given. 44-17D

#### ENGINEER DEPARTMENT, BALTIMORE AND SUSQUEHANNA RAILROAD COMPANY.

October 19, 1835.

To Contractors.—Proposals will be received between the 20th and 25th of November next, for the Graduation and Masonry on 30 miles of this Road.

ISAAC TRIMBLE,

Engineer B. & S. R. Co.

WILLIAM GIBBS McNEILL,

Consulting Engineer.

#### ENGINEER DEPARTMENT, WRIGHTSVILLE AND YORK RAILROAD COMPANY.

October 19, 1835.

To Contractors.—Proposals will be received in York, Penn., between the 20th and 25th of November next, for the Graduation and Masonry, of the whole line of Road.

ISAAC TRIMBLE,

Engineer W. & Y. R. Co.

WILLIAM GIBBS McNEILL,

Consulting Engineer.

Oct 21.—3t.

#### TO TUNNEL MINERS, DRILLERS, &c.

Wanted, immediately, 40 Tunnel Miners, (Cornish Miners will be preferred,) 80 Drillers, 50 Laborers, and two experienced Mine Blacksmiths, on the New York and Harlem Railroad, about five miles from the City. Liberal wages will be given, and cash payments made every fortnight. Apply at Mr. FOWLER'S, St. John's Hall, Frankfurt street, New-York.

JOHN RUTTER, Contractor.

The Albany Argus, Philadelphia U. S. Gazette and Pennsylvania, will please copy this, and send their bills to the Railroad Company, 14 Wall street, New-York, 23-4f

#### NEW-ORLEANS AND NASHVILLE RAILROAD.

##### NOTICE TO CONTRACTORS.

The New-Orleans and Nashville Railroad Company having decided to place under contract the first fifty miles of the Road, on the 15th day of December next, Proposals will be received at their Office, in the City of New-Orleans, from the 15th of November to the 15th day of the center next, for the Graduation and Bridging of the same.

The Superintending Engineer, H. S. Ranney, will be upon the ground to give every explanation relative to the manner of making Proposals, and such other information as may be required.

Of persons not personally known to the Engineer, there will be required certificates of character and qualifications.

This part of the road extending along the shore of Lake Pontchartrain, is perfectly healthy throughout, and being the commencement of the most extensive work in the world, it cannot fail to be of great importance to Contractors to identify themselves with the work at its commencement, as those who are known to the Company as responsible and efficient will certainly be preferred to strangers during the future progress of the road.

The country through which the line passes is generally high pine ridge, and perfectly healthy.

H. J. RANNEY,

Chief Engineer N. O. & N. Railroad.

Engineer Office, N. O. & N. Railroad, )

Aug. 25, 1835.

37

#### TO TUNNEL CONTRACTORS.

Proposals will be received by mail, or otherwise, for excavating a Tunnel on the summit of the Sandy and Beaver Canal. The Tunnel is 900 yards long, the material to be removed is a soft sand-stone rock, the highest part of the ridge through which it passes is about 90 feet above the top of the Tunnel. As the deep cuts at the termination are not excavated, most of the material will have to be removed through shafts. Proposals must be accompanied with good recommendations, as to skill and competency.

E. H. GILL,

Engineer.

New-Lisbon, Ohio, Sept. 17, 1835.

#### RAILROAD IRON WORK.

Of all kinds, made to order by GODWIN, CLARK & CO., Paterson, New-Jersey.

CAR WHEELS, BOXES, AXLES, and CAR FRAMES, made and fitted complete, at short notice, and fair prices.

Orders addressed to them at Paterson, N. J., or 24 Broad street, N. Y., will meet with immediate attention. 34-1y

#### AMES' CELEBRATED SHOVELS,

SPADES, &c.

500 dozens Ames' back-strap and plain Shovels,

75 do do round-pointed do

150 do do cast steel Shovels and Spades,

100 do do Bucket Shovels and Spades,

150 do do steel plated Spades,

Together with Pick Axes, Churn Drills, and Crow Bars, steel pointed, made from Salisbury refined iron. For sale by his Agents,

WITHERELL, AMES & CO.

2 Liberty street, New-York.

BACKUS, AMES & CO.

8 State street, Albany.

34-yif

#### RAILROAD CASTINGS.

MANY & WARD, Proprietors of the Albany Eagle Air Furnace and Machine Shop, will make to order car wheels, chairs and knees, and every other description of castings required for railroads. R-ly feb1

#### STEPHENSON,

Builder of a superior style of Passenger Cars for Railroads.

No. 204 Elizabeth street, near Bleecker street,

New-York.

RAILROAD COMPANIES would do well to examine these Cars; a specimen of which may be seen on that part of the New-York and Harlem Railroad now in operation. 345 if

#### RAILROAD IRON.

300 tons of Railroad Iron of the T pattern, just imported and for sale by HOWLAND & ASPINWALL, 55 South street.

#### RAILWAY IRON.

25 tons of 1 inch by ½ inch, Flat Bars in lengths of 14 to 18 feet, counter sunk holes, each cut at an angle of 45 degrees, with splicing plates and nails to suit.

250 do. of Edge Rails of 36 lbs. per yard, with the requisite chairs, keys and pins.

Wrought Iron Rings of 30, 33, and 36 inches diameter for Wheels of Railway Cars, and of 60 inches diameter for Locomotive wheels.

Axles of 2½, 3, 3½, 4, and 4½ inches diameter for Railway Cars and Locomotives of patent iron.

The above will be sold free of duty, to State Governments and incorporated Governments, and the Drawback taken in part payment. A. & G. RALSTON.

9 South Front street, Philadelphia.

Models and samples of all the different kinds of Rails, Chairs, Pins, Wedges, Spikes, and Splicing Plates, in use both in this country and Great Britain, will be exhibited to those disposed to examine them. 471mcwv

#### PARTNER WANTED.

Wanted, a partner in an extensive Printing Establishment. No one need apply who is not a thoroughbred printer, competent to superintend and direct an office in which upwards of 30 persons are employed, and able to furnish \$3000 cash capital. The best of references will be given and required. Letters, with real name, may be addressed to P. P. P., Post Office, New-York, postage paid, and they will be promptly attended to. May-4f

## AMERICAN RAILROAD JOURNAL.

NEW-YORK, NOVEMBER 26, 1836.

**EXPLICIT DIRECTION.**—We are amused at times at the thoughtlessness of persons in giving directions to others, for the performance of their wishes. It is not uncommon for us to receive a request to *change* the direction of the Journal, and we are always ready to do so, when we know how to do it properly; but, in order to do so correctly, it is necessary that we first know where to *stop*, and then where to *direct*, it. But we have an instance now before us, which puzzles us as much as *Patrick's* inquiry at the Post-Office, for a letter, did the P. M. Says Pat, "and have you a letter for me?" "What is your name?" says the worthy P. M. "My name is it you ask," says he, "and isn't it on *the letter* sure?" So with the person who desires us, on the margin of a paper, to send him R. R. Journal to *Mobile*, he might say, "Is not my name on your books?" Very likely; but which of the 800 names there, we are entirely unable to imagine, and therefore shall be obliged to wait for his further directions; which, we hope, will be accompanied by a five dollar U. S. note, for the *ensuing* year, together with all arrearages, if there be any due for the Journal; if so, he may rely upon early attention to his wishes, and our best thanks for his improved mode of giving directions.

**TO BRIDGE BUILDERS AND RAILROAD CONTRACTORS.**—We ask the attention of our readers to the following notice from R. S. VAN RENSSELAER, Esq., the Engineer of the *Vicksburg and Jackson, Mississippi, Railroad*. It offers a good opportunity for a winter's campaign, and will doubtless afford a handsome profit to enterprising men.

### VICKSBURG AND JACKSON RAILROAD.

**NOTICE TO CONTRACTORS.**—Sealed Proposals will be received by the subscriber, at Vicksburg, from the 1st to the 16th of January next, for the grading, bridging and masonry on the eastern division of this Road, from Big Black River to the town of Jackson, a distance of 34 miles.

Three Bridges of considerable magnitude, one to be constructed over Big Black River, 300 feet between the abutments, and two over Baker's Creek, about 60 feet between the abutments, are jobs well deserving the attention of experienced contractors.

Proposals will also be received, at the same time, for putting down the superstructure on the western division, extending from the Mississippi, at Vicksburg, to Big Black River, a distance of 13 miles.

Individuals disposed to contract for the execution of the whole, or any part of this work, will be required to furnish certificates of qualification and character, unless personally known to the subscriber.

Plans and profiles of the line, and drawings of the different constructions on it, may be seen, and all necessary information obtained, by applying at the Engineer's Office, in Vicksburg, between the 20th December and the time for letting.

R. S. VAN RENSSELAER, Civil Engineer.

Vicksburg, November 2nd, 1835.

**BALTIMORE AND OHIO RAILROAD REPORT.**—We acknowledge the favor, by the President of the Company, of a copy of the sixth annual Report of the Baltimore and Ohio Railroad Co.; and cannot refrain from here expressing our own, and we believe we do not say too much when we say the, thanks of the whole Railroad community, as well in Europe as in America, for the candid, business-like and liberal manner in which they annually lay before the world the result of their experience.

It will not be saying too much, we are sure, to denominate them the *Railroad University of the United States*. They have

labored long, at great cost, and with a diligence which is worthy of all praise, in the cause; and what is equally to their credit, they have published annually the result of their experiments, and distributed their reports with a liberal hand that the world might be cautioned by their errors and instructed by their discoveries. Their reports have in truth gone forth as a text book, and their road and workshops have been as a lecture room to thousands who are now practising, and improving upon their experience. This country owes to the enterprise, public spirit, and perseverance, of the citizens of Baltimore, a debt of gratitude of no ordinary magnitude; as will be seen by the following extract from the President's Report, in relation to their improvements upon, and performances with, their locomotive engines, when compared with the performances of the most powerful engines in use, or rather in *imagination*, in 1830, only six years ago.

If such are the results and improvements of one Company in the short space of six years, when so few comparatively have participated in the subject of Railroads, what, we would ask, will they not be within the next ten years, when Railroads shall become, as they are now certainly becoming, the most extensive, and the most important branch of business of the country? Who dare predict, or hazard a conjecture, as to the improvements upon those now in use? We need not say that he who should hazard anything like the following, viz. that before the 4th of July 1845, it will be considered no great performance to leave New-York at sunrise, *transact business in Albany, return again to New-York before the setting of the sun*; or that the mail will be transported from this city to Lake Erie in *twenty-four hours*, delivering and receiving mails at every principal village on the route—or that the distance from this city to Boston, and to Washington City, will be only a nine, or at the extent, ten hours

journey; and that eight days to New Orleans will be *laughed at!!!* would be recommended as a suitable subject for the asylum, at Manhattanville. Yet such, asylum, or no asylum, we predict will be the case, and also that the improvements in other parts of the country will keep pace with these great thoroughfares.

That our readers may perceive the rapid strides of improvement in locomotive engines, we give the following extract from the offer of the Liverpool and Manchester Railroad Company, dated April 23, 1829:

"Stipulations on which the Directors offer a premium of 500*l.* for the *most improved Locomotive Engine.*"

"The said engine, if it weighs six tons, must be capable of drawing after it, day by day, on a well constructed Railway on a plane, a train of carriages of the gross weight of *twenty tons, including the tender and water tank, at the rate of ten miles per hour.*"

Here we have the very best evidence of the extent of the views of intelligent men, in 1829; men whose reputation and interest were at stake, and who would, therefore, have been like to require all that they could anticipate, viz. 20 tons on a level road at ten miles per hour, and they truly required wonders; but such has been the influence brought to bear upon the subject, that in 1834 the Baltimore and Ohio Company constructed an engine which took 112 tons on a level at the rate of 12 miles per hour, and up an inclination 17 feet per mile on a curve with a radius of only 1000 feet, at the rate of 6½ miles an hour; and which also passed a plane of two thirds of a mile in length, and 264 feet per mile ascent, with eleven tons, exclusive of the engine of 7½ tons;—and in 1835 another engine belonging to the same company took a load of 113 tons 30½ miles at the average speed of 12 miles per hour, overcoming grades of twenty feet per mile for six consecutive miles with ease, which is at least equal to 213 tons at 10 miles an hour on a level road; or more than ten times the requirements of the Liverpool and Manchester Road, in 1829. The following extract is from the ninth annual Report of the Baltimore and Ohio Company, and will sustain us in our assertion that this community owe them a debt of gratitude not to be estimated; which will be paid, however, by using the information thus obtained to construct other Roads to compete with them for the business, and to draw the trade and travel to the northern and southern cities. Much more might be said by way of illustration of the benefits conferred upon mankind by the operations of this Company; but we shall give the main part of this valuable document in the Journal hereafter—for the present we ask our readers to compare the state of improvements in 1829 and 1835, and then to imagine, if possible, the extent of the improve-

ments which will be effected within the next ten years.

In the last annual report, the power of the "Arabian" locomotive engine, was mentioned; and it was stated that it had drawn upwards of 112 tons on a level at the rate of near twelve miles an hour, and the same weight up an ascent of 17 feet per mile, occurring on a curve of 1000 feet radius, at the rate of 6½ miles an hour. Afterwards, in December, 1834, the same engine passed over the planes at Parr's Ridge, ascending two-thirds of a mile at the average rate of 264 feet per mile, with two cars full of passengers, making with the tender 11 tons, exclusive of its own weight of 7½ tons. This experiment with the "Arabian," led the Board to consider the propriety of re-locating the Road at the planes, as already mentioned, so as to dispense with the use of stationary or horse power there.

The "Arabian" was the first engine built after the adoption of the present plan. It is now in daily use, travelling 80 miles without slackening its fires, or letting its steam get down, and is in perfect order. There are five other engines like it, on the road, and three more will, in a short time, be completed, and ready for use.

On the 26th of September last, a load amounting to 113 tons, was attached to the "Washington," a new engine on the plan of the Arabian, weighing eight tons, with a view of making an experiment of the effective power of the Company's engines on the Branch Road. With this great weight, the engine travelled to the city of Washington at a rate, not less, at any place, than ten miles an hour, preserving this, the least speed, up ascents, of five and six miles in length, of twenty feet to the mile. The train was several times purposely stopped on the ascending grades, and when the steam was again applied, the engine would steadily regain its previous velocity, and maintain it with apparent ease. The same load was brought from Washington to Baltimore at the same rate. The average speed was much greater, and upon the level parts of the road, seemed entirely at the discretion of the engineer. The same engine, on a level, exerting the same power, would have drawn 213 tons at the rate of ten miles an hour. During the whole time there was a superabundance of steam. Performances like this, are, it is believed, unequalled in the history of Railroads.

JOHN RANDEL, JR. vs. THE CHESAPEAKE AND DELAWARE CANAL COMPANY.—By the following notice we perceive that the long contested suit of Mr. Randel against this Company is at length decided, and that Mr. Randel is, to all intents and purposes, entitled to the entire income of the Canal, until his judgment is satisfied.

In this controversy, Mr. R. has contended against great odds, but, with justice, equity, and law, all on his side, he has at length succeeded, and will eventually be remunerated for his losses of money, but not for his loss of time, nor the perplexity necessarily attendant upon a ten years' litigation.

John Randel, jr.,  
vs.  
Garnishees of the  
Chesapeake & Delaware Canal Company.

In the High Court of  
Errors and Appeals  
of the State of Delaware, attachment fieri facias, on judgment upon Case stated.

A judgment has been rendered in the above cause in favor of the Plaintiff, and he hereby gives notice to all whom it may concern, that he intends, from this day, to enforce payment of his judgment rendered in New-Castle County, at December Term, 1833, against the Chesapeake and Delaware Canal Company, for two hundred and twenty-six thousand, eight hundred and eighty-five dollars and eighty-four cents, (\$226,885 84,) with interest and costs, by process of attachment according to the laws of the State of Delaware.

The decision above referred to, establishes the important question, that the Chesapeake and Delaware Canal Company, in demanding and receiving the tolls attached, acted in contravention of the law. Whether it will be the pleasure of this Corporation, further to set at defiance the declared law of the land, by extorting the payment of tolls which may be hereafter attached, time will unfold.

The undersigned regrets exceedingly, that, by the refusal of the Chesapeake and Delaware Canal Company to satisfy his just claims, after a tedious, expensive, and protracted litigation of nearly ten years, he should be compelled to resort to measures which, in their execution, may be convenient to those who may navigate the Canal, but this measure has been forced upon him by the conduct of the Canal Company. It is his intention, however, to give as little trouble to those who may become indebted for tolls to the Canal Company, as may be consistent with the enforcement of his just rights.

JOHN RANDEL, JR.

New-Castle, Del., October 31st, 1835.

## RAILROAD INTELLIGENCE.

We commence in this number, what we hope to be able to continue, regularly hereafter, a summary of the movements, in different parts of the country, in relation to Railroads and Canals. Heretofore other avocations have rendered it impracticable.

We shall probably be able, also, to give some interesting information in relation to the various Railroads in use, and in course of construction in Europe.

We commence to-day by giving from the *London Railway Magazine*, (a small work of 28 pages monthly, at 6s. sterling a year) an interesting communication from Mr. Vignoles.

It will be seen that Mr. Vignoles puts down the Railroads in use in Great Britain at nearly 250 miles; and those in course of construction at 400 miles, whilst we have in this country at least 800 miles of road in use, and near 2000 miles more commenced, and in rapid course of construction; and what is of still more interest, there will be 1000 miles in addition to the above commenced before next Spring.

It is indeed true, as Mr. Vignoles observes, "that it is in the United States where the great impulse is given to Railroads," and it is equally true, as he further remarks, that "Railroads create their own resources of revenue."

We ask the attention of our readers to the following:

Extract from a paper drawn up on the Dublin and Valentia Railroad, by C. VIGNOLES, Esq., Civil Engineer.

"The advantages afforded by Railways have now become sufficiently appreciated. They comprise the civilization and employment of the laboring part of the community; the distribution throughout the whole country of useful expenditure, which the localization of manufacture and capital has before secured in monopoly to particular districts; the equalization of the value of property, and more especially rapidity and economy of communication, thereby affording the means of obtaining an intimate knowledge of all the wants and interests of the remoter provinces.

"Consequent on the appreciation of these objects has been the progress of the Railway system throughout Europe and the United States.

"In Great Britain, the successful experiment between Liverpool and Manchester gave birth to numerous projects, of which some have been already accomplished; and there are now in profitable operation nearly 250 miles of Railway\* in various parts of that country.

"Within three years the Railway from London to Liverpool will be completed, besides various other great connecting lines, altogether 400 miles† of Railway, are at this time in progress of construction in England alone. Applications for 200 miles,‡ including the Bristol line, are before Parliament; and companies are now forming for upwards of 500 miles,§ among which is the connexion between Glasgow and Edinburgh, and between York and London; in all, nearly 1400 miles.

"In Belgium, the first portion of the chain of Railways between Antwerp and the Rhine has, within these few days, been opened to the public. Hamburg, justly alarmed, is negotiating with Hanover on one bank of the Elbe, and with Prussia on the other, to secure a Railway through one of these kingdoms into Saxony, Bavaria, and Bohemia, which will not merely advantage her present trade, but bids fair to divert to Hamburg the commerce of Trieste, for the supply of central Germany with colonial produce and manufactures.

"France has tried the experiment successfully near Lyons; and the government have publicly declared they will become partners in the lines now in progress from Paris to the coast. Even in Austria there are two very extensive lines of Railroad at work.

"It is, however, in the United States where the greatest impulse has been given

to Railways. Many hundred miles are already executed, and vastly more are in contemplation.

"In the small State of South Carolina, a Railway of 150 miles, in one continued line, is in actual operation. The whole population of that state is scarcely 300,000 souls; wages are 5s. a day, and capital at 7 per cent. interest; yet private enterprise chiefly has executed this great line, which is now, by its success, proving practically the truth of the principle long established in the minds of persons competent to judge, that Railways create their own sources of revenue.

"It seems incredible, that in Ireland, with a population of 8,000,000, multitudes of them in beggary, and too often in starvation from want of work, with wages at from four pence to one shilling a day, and money at four per cent., one short Railroad alone has yet been executed.

"However philanthropists and politicians may differ about many of the causes of the sufferings of the Irish poor, however various the proposed remedies, all unite in declaring that want of employment for the laboring classes is the leading evil, requiring the application of an immediate remedy; and all experience shows that an expenditure of money on public works has invariably introduced comfort and peace to the destitute and disturbed districts, and has increased the public revenues of the country in direct proportion to the amount of money expended. Public works, the effects of which have the great value of improving and increasing internal intercourse, trade, and manufactures, must be the most desirable of any, and more so, when their ultimate tendency will be to combine facilities for foreign communication, and particularly those of a commercial nature.

"Such public works are Railways; the new means of communication on land by steam; a power which on water has already been so highly beneficial to Ireland.

"Carrying the line to an ultimate terminus at Valentia Harbour, on the very verge of the Atlantic Ocean, the undertaking ceases to be considered in a local point of view, and becomes a great national work, in which Great Britain, Europe, and the Americas would be as much interested as Ireland. We should, in fact, have arrived at a port which nautical men, statesmen, and many acute inquirers, have at various times, and under different circumstances, and without communication or connexion with, and even without knowledge of each other, recommended as the most eligible harbour for the foreign arrivals and departures of the United Kingdom.

"The attention of the Government has often been called to the eligible situation of Valentia Harbour, and the highest naval authorities have given evidence to Parliament of the peculiar combination of advantages which it possesses as a packet station. Captain Beaufort, R. N.; and hydrographer to the Admiralty, states, that 'the first object of all vessels, bound either to America, to the south of Europe, or India, is to get far enough out of the Channel to be able to adopt either tack without fear of the land; the next object is, to fetch to the westward of Cape Finisterre.' By sailing from the harbour of Valentia, the most westerly port in Europe, both these objects are secured. Captain Beaufort further states, that 'whenever possible, a packet harbour should have two ways of exit, like Spithead, for instance.' Valentia Harbour possesses this advantage, having too easy practicable inlets to an excellent receptacle for shipping, capacious, safe, and locked.

"The intervening transit between Valentia (the nearest point of land in Europe to America) and the harbour of New-York is unobstructed by islands, rocks or shoals; and the distance being less than 2700 miles, may be traversed by steam packets, such as those now running between Kingstown Harbour and Liverpool, in ten or twelve days. London will thus be brought within a fortnight's distance of the Canadas and the United States. Liverpool may be reached, on the completion of the English Railway, in ten hours from London; the average passage (looking forward to no increased speed in steamboats) from Liverpool to Kingstown in fourteen hours; and by this proposed Railway of 200 miles from Kingstown Harbour to Valentia Harbour, the run across Ireland would be made in ten hours. In all 34, or at most 36, hours from London to the shores of the Atlantic; and on great emergencies, and with a favorable water passage, it may be reduced to 28 hours. The fact is almost incredible, but it is undeniable.

"If, as stated by Captain Beaufort, 'the establishment of a post office packet station at Valentia would insure a saving of four or five days in the voyages of sailing vessels,' can it be doubted, that with such a ready connexion with London, Valentia Harbour will not be the great outport of the United Kingdom, and (passing rapidly over the chain of intermediate reasoning) of France and all northern Europe. In short, Ireland would become the great highway of nations from the Old to the New World."

VALUE OF RAILROADS.—The question is well put, by the editor of the Boston Daily Advertiser, "whether Railroads, independent of their income to stockholders, are to be regarded as a public improvement?" The truth will, ere long, be more generally admitted, that, in many cases, however profitable the road may be to the stockholders, it is still more profitable to the community; especially to that portion who travel; have goods or produce to transport, or own property in its vicinity. The stockholders, in that capacity alone, are the least benefitted of any portion of the community, however large may be their dividends.

THE LOWELL RAILROAD.—We copy the following statement from the Lowell Courier. The reader may judge from it whether the Railroad, independently of its income to the proprietors, is to be regarded as a public improvement. The number of passengers who travel on this Railroad, will probably average 500 daily. The usual speed is something less than the rate here stated, but the average length of a passage is but a little over an hour. The average time which was required, before the opening of the Railroad, for making the passage, was not far from five hours. To say nothing of the saving of money to those who travel on this route, is it no public advantage to make a saving in time of four hours to 500 persons daily? Is it not easy to imagine that business is expedited, and the public good promoted, as well as the ease and convenience of individuals, by this saving of time?

"Railroad.—The train we understood, came up from Boston, Tuesday forenoon; in fifty-five minutes, including the stop at the half-way place. Allowing for that stop 3 minutes, it travelled at the rate of thirty miles an hour, for the whole distance! The engine was a new one, made in Lowell."

CANAL INTELLIGENCE.

It will hereafter be our aim to give a short summary of all the various Canals, as notice may be taken of them by the newspapers in their immediate vicinity, by which means our readers will have some idea of their progress and prospects; and from which, we trust, good will result to the cause of Internal Improvements throughout the country.

The same course will be pursued in relation to Railroads.

In the Cumberland Advocate, says the National Intelligencer, we find the following notice of the result which the location of the Chesapeake and Ohio Canal through that town, will produce there:

"The Canal Basin is to be formed about one hundred yards below the Chain Bridge, a little to the left of the mouth of Will's Creek, at the Western end of Hoblitzel's and Hey's Island. It takes a narrow strip off the lots now owned and occupied by Messrs. H. Wineow, M. Fisher, J. Shriver, S. Charles, A. Russell, M. Rizer, jr., G. G. Wineow, and D. Shriver, who have given the right of way.

"The dam to be constructed at Beall's Island, about one mile below the town, will back the water, it is said, as far up Will's Creek as the old market house, which is near the centre of the town, forming all the way a canal or basin sufficient to transact any amount of business required. It is also to back the water in the Potomac to a point near two miles above, or southwest of the town, which will join Will's Creek at its mouth (as the river now does) and join the basin by a *guard lock*.

"The whole, when completed, will form a splendid Basin of about *four miles* long, and between a half and a quarter mile wide. It will present more the appearance of a Lake than a Basin, and will be competent to hold more than one thousand Canal Boats at the same time—and as one of our townsmen remarked a short time since, 'it will afford pleasure boats with sail—steamboats, coal boats and trade boats; and will be a place of general resort for fishes and water fowl of every description.'

"It may be said of Cumberland that she is rising. Nothing can now prevent it. Her situation is healthy and romantic. She has, or soon will have, one of the most splendid Canals in the United States, leading from her centre eastward to the Metropolis of the Nation—thence to any port in the world. And leading from her centre westward, there is an unrivalled Macadamized Road, which is destined to convey to her depots a large portion of the Western Trade."

There is no work of the kind now under consideration more deserving of attention, than the NIAGARA SHIP CANAL. The following article, in relation to this contemplated work, is from the CHICAGO AMERICAN. We wish it could be read by every true son of this Union, and that he could at the same time justly appreciate the importance of the work.

To us, who have for years devoted so much time to the consideration and importance of a more extended scale of Internal Improvements, argument to establish its necessity seems superfluous; yet we are aware that others have their doubts as to the policy of pushing such works,

especially if the State is to furnish the whole, for a part, of the means, to the extent desired by us. In this we doubt not their honesty—yet it does appear that, so long as the expenditure tends to increase the value of every man's property, and a sufficient revenue at the same time is derived from the works, not only to pay the interest, and repairs, but also eventually to liquidate the original outlay, there must be a great want of foresight and liberality, or intelligence, in those who cannot be convinced.

NIAGARA SHIP CANAL.—No improvement of a national character so eminently deserves the attention of the people of the Western States, as the proposed Ship Canal around the Falls of Niagara. Those States that border upon the great Western Lakes, or that are, or may be connected with them by natural and artificial navigable communications, have a deep interest in the prosecution of this work. It will remove the barrier that is now only in part surmounted by the Welland Canal, and open a safe, cheap and convenient communication between the upper and lower Lakes, within the Territory of the United States, and enable the West to conduct her commercial operations independent of our British neighbors. It will also enable us to approach one hundred and sixty-one miles nearer to the city of New-York with vessels of the largest class navigating the Lakes, insure certainty, increase the speed, and reduce the cost of transportation.

The people of this State will derive immense benefits from this improvement, as the staple productions of the soil must and will seek the New-York market. When the Illinois and Michigan Canal shall be completed, and the Erie and Hudson Canal of New-York enlarged, so as to admit the passage of vessels of one hundred and twenty tons burthen, from Oswego on Lake Ontario to the Hudson River, as now contemplated, this route to the seaboard will combine more advantages than any other that can be obtained; for certainty, safety, and economy of transportation, so essential to all commercial transactions, will be secured, and the most advantageous market in the United States for the products of the West attained. Even now, without the proposed improvements around the Fall, and the enlargement of the New-York Canals, with only the imperfect facilities afforded by the Welland Canal, the rate of transportation on goods from New-York city to Chicago and other ports on Lake Michigan, by the way of Oswego, is considerably less than by the way of Buffalo; and our merchants here are able to save, by preferring the former to the latter route, from *twenty-five to seventy cents* per barrel bulk. This saving is owing to the superior economy of Lake over Canal transportation, and will be materially increased by the proposed Ship Canal.

No improvement of the same extent can be found that will benefit so large a portion of the United States at so little cost, or that will give so general and extensive facilities to internal commerce, as the one under consideration. As a means of national defence, this work demands the serious attention of Congress,—it will facilitate the transportation of troops and munitions of war, and hasten the rapid concentration of naval and military forces at important points along the great extent of our northern and western frontier.

The United States Engineers have just completed the survey of the several routes for this Canal. They consider the project perfectly practicable, and of much less expense than it has generally been estimated at, and far less than the great importance of the work would justify.

We may well consider, in connexion with this, the ILLINOIS and MICHIGAN CANAL. The people of Chicago, in their exertions to aid in pushing their great work around Niagara Falls, forget not—as they certainly should not—their immediate affairs.

We find in the American, of November 7th, a reference to, and an account of, the proceedings of a meeting held there on the 2d, from which we extract one or two resolutions showing the spirit of the people, and from such a spirit good must result. We need not say how much we desire to have that improvement, either as a Canal, or Railroad, commenced.

CANAL MEETING.—In another column will be found the resolutions passed at the Canal Meeting held in Chicago on Monday evening last. They are full and comprehensive, and must meet the approbation and response of every well informed citizen. They exhibit enlarged views of the subject of Internal Improvement, and call for immediate and efficient action in relation to the Illinois and Michigan Canal. We believe they spoke the sentiments of the great body of the people of this State.

Resolved, That the construction of the Illinois and Michigan Canal is an enterprise eminently calculated to raise the character of the State to a high standing abroad, to open to her citizens a navigable inland communication from the Gulf of Mexico to the Bay of New-York and the Gulf of St. Lawrence, embracing in its influence a large portion of the Union, bringing to their doors an extensive and ready market; opening an easy and direct communication between the Lakes and the fertile and extensive valley of the Mississippi, the most productive region of America, and calculated to contain a dense population, whose products and consumptions must at all times keep up a lucrative and active trade, "exciting the powers of productive industry, furnishing aliment and giving energy to external commerce—the riches it will create, the energies it will call into action, and the blessings it will produce, are so plain and obvious as to be beyond all question."

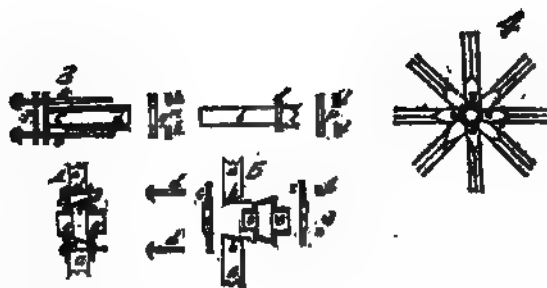

Resolved, That a meeting of the citizens of this town, be held at this place on the 11th day of November, instant, to consider what measures are proper to be adopted to co-operate with the citizens of other States in an application to Congress to open a Ship Canal between Lakes Erie and Ontario, round the Falls of Niagara.

The meeting then adjourned.

E. PACE, President.  
B. S. MORRIS, } Secretaries.  
P. T. TEMPLE, }

LAUNCH.—The new steamboat *New Jersey*, will be launched the latter end of this week, from the corner of Hudson and Essex streets. She is intended for the Jersey City ferry, and is the largest and finest ferry boat in the country, and will of course increase the accommodations on this ferry, already fully equal, if not superior, to those of any other in the United States.

The facilities of access to New York, by means of the Paterson and Newark railroads, have increased the travelling to such a degree as to render an additional boat necessary.—[Jersey City Gaz.

[From the London Repertory of Patent Inventors.]  
*Specification of the Patent granted to JOSEPH GIBBS, of Kennington, in the County of Surrey, Engineer, for certain Improvements in Carriages and in Wheels for Carriages.*—Sealed November 4, 1834.

WITH AN ENGRAVING.

My invention of certain improvements in wheels for carriages consists in a peculiar arrangement of the spokes and naves of wheels, whereby wheels may be constructed with greater facility as will be hereafter fully described.

*Description of the Drawing.*

Fig. 1, represents a wheel constructed according to my improvements, which I prefer first to describe.

Fig. 2, is an edge view in section.

Fig. 3, shows the nave in section, which is of metal. This nave also constitutes the axletree box.

Fig. 4, shows part of a wheel in section in order to shew the arrangement of the spokes. In each of these figures, (1, 2, 3, and 4,) the same letters indicate similar parts, *a, a*, being the felloes of the wheel, there being mortices cut in them to receive the ends of the spokes, as is clearly indicated in the drawing at fig. 2. *b, b*, are the spokes which it will be seen stand at an angle to each other, and each two (proceeding from opposite ends of the nave) appear when the wheel is viewed edgewise to form the two sides of an isosceles triangle, of which the nave represents the base; but it will be seen that the spokes are inserted at equal distances from each other in the felloes, and they are alternately placed at the

two ends of the nave, as is very clearly shown in fig. 2, and the ends of the spokes are slightly hollowed out in order to abut against the axletree box which constitutes the nave of the wheel. *c*, is a plate formed on the outer end of the axletree box, *d*. The spokes may be so formed at the ends which come against the axletree box, *d*, that they just fill in and wedge one another, as shown in fig. 4, or there may be longitudinal grooves cut or cast on the outer surface of the nave or axletree box. *e, e*, are screw bolts which retain the parts of the wheel together, and also hold the axletree within the axletree box, as will be hereafter fully described. *f*, is a washer which lies against the plate, *c*. It will be seen that the spokes, *b*, which project outward from the felloes come against the plate, *c*, and the spokes, *b'*, which project inwards are retained in their position by the plate, *g*, and this plate is held to its proper position by the screw bolts, *e, e*, by means of the nuts, *h*. The axletree, *i*, has a collar, *j*, formed thereon, and by means of the plate, *k*, the screw nuts, *l*, and the screw bolts, *e, e*; the axletree is held within the axletree box, *d*, as will be evident on inspecting the various figures in the drawing.

Having thus described the various parts of the wheel, when constructed according to my invention, it is necessary to point out more particularly the peculiar novelty of the construction which constitutes the invention secured by the above recited letters patent. It will be evident, that as any two succeeding spokes, *b, b'*, may be said to form the two sides of an

isosceles triangle, the axletree box or nave, *d*, forming the base of such triangle, if the plate, *g*, be made to approach the plate, *c*, the spokes, *b'*, will approach the spokes, *b*, that is to say, they will approach more nearly to the perpendicular, which will tend to expand the circumference of the felloes, and make the whole wheel most rigidly secure, and thus in case of the spokes becoming loose, the wheel may be made firm by merely screwing up the plate, *g*; and it may be remarked, that a wheel constructed according to these improvements, may be repaired in much less time, and at less expense, than when wheels formed in the ordinary manner; for it will only be necessary to remove the plate, *g*, sufficiently to take out any faulty spokes and replace the same with others and then to screw up that plate, *g*, and the wheel will be again complete.

Fig. 5, represents a different arrangement for expanding the spokes and felloes. The spokes which are shown edgewise and in part at *a, a*, are all placed in the same plane, and held in their places by the plates, *c, c*, and bolts and nuts, *d, d, d, d*. If the spokes were arranged so as to form a smaller cone at their interior end than that at the exterior of the box, *e, e*, it is evident that by screwing up the nuts on the bolts, *d, d*, the cone, *e, e*, would be forced through the conical hole formed by the spokes, and thereby push the whole of them outwards towards the felloe, and so produce an expanding action outwards. The box and spokes when screwed up would appear as at *a*, fig. 5.

Having thus described the nature of my invention of certain improvements in wheels for carriages, and the manner of carrying the same into effect, I would have it understood that I lay no claim to the various parts of a wheel, which are well known; but I do hereby confine my claim of invention to the arranging of the spokes so that they are capable of expanding out the felloes, and thereby offering great facilities in constructing as well as in repairing wheels so formed.

And further, as relates to my improvements in carriages, the same are ascertained and described by reference to the drawings.

Figs. 6 and 7, which represent such parts of a carriage as are necessary to explain my invention, the same letters of reference are applicable to both these figures. *a*, is the axletree of the carriage. *b, b*, is a box or barrel (shown at fig. 6, with one of its ends removed to exhibit the interior,) which contains a spiral spring, *c, c*, one end of which is attached to the axis, *a*, and the other to the box, *b, b*. The action and construction of this spring, therefore, is similar to the main spring of a watch. Round the periphery of the barrel, *b, b*, is wound the leather strap, *d, d, d*, attached to the barrel at the point, *e*, and to the supporting rod, *f, f*, at *g*, which supporting rod is bolted to the shafts (or any convenient part of the carriage) at *h, h*. It is evident, therefore, that if weight be

added to the carriage, such weight will tend to depress the body of the carriage by pulling round the strap, *d, d*, and causing the box or barrel, *b, b*, to turn on the axis, *a*, and thus partially wind up the spiral spring, *c, c*. In the application of this invention I make use of two such boxes and springs as shown at fig. 7, and, thus arranged, the motion of the carriage will nearly correspond with that of a carriage with common springs. It will be evident, however, that in this arrangement some apparatus is necessary to prevent the axis from turning round, and also to prevent the carriage from rising and falling in an improper direction. This arrangement is shown at figs. 6 and 7, and may be thus described. Two flat bars of steel, *i, i*, are bolted at one of their ends to the flaps of the axis at *j, j*, and at the other (by bolts) to the knuckle joints, *k, k*. By this apparatus, when the carriage vibrates upon its

spring it will describe a curve represented by the red line, *l, l*, fig. 6, being a segment of a circle of which the bars, *i, i*, are the radii, and the knuckles, *k, k*, the centre. The motion of the carriage, therefore, is nearly vertical, and sufficiently so for practical purposes.

Having now described the nature of my invention of improvements in carriages, I hereby declare that I claim as my invention as far as relates to my improvements in carriages, the application of a spiral spring and barrel, as a substitute for the ordinary springs of carriages, and the mode by which the axis is connected to the body of the carriage, viz., by the radius bars, *i, i*; and though the parts individually may have before been used in machinery, yet I claim the whole as a new combination, forming an improved substitute for the ordinary springs of carriages. In witness whereof, &c. Enrolled May 4, 1835.

NOBLE'S IMPROVEMENT IN THE APPLICATION OF STEAM.

[From the Repository of Patent Inventions.]  
Specification of the Patent grant  
WILLIAM ALFRED NOBLE, of  
Street, Cherry Garden Street,  
monday, in the County of Surrey  
gineer, for certain Improvements  
applying Steam to the common  
other Engines. Sealed Decemr  
1834.

WITH AN ENGRAVING.

My improved steam engine consists having two pistons in one cylinder which means the engine is one-half make double the number of strokes would do if it had but one piston, consequently double the velocity (or power) obtained without the aid of multi wheels.

Description of the Drawing.

The annexed drawing is a representation of a perpendicular section of cylinders for a pair of thirty-horse power engines. *a*, the cylinder. *b*, pistons, *c*, the hollow piston rod, stuffing box at the end, which admits the piston rod to the lower piston *p* through. *d*, the solid piston rod to piston. *e*, the steam port which the steam to act on the upper side. upper piston, *b*. *f*, the steam port

to act on the underside piston. *g*, the steam port the steam in the centre of *o* enable it to act on the *h*, the cistern which contains pump and the condenser. inspecting rods to the crank, the power of the two admitted. *k*, the four throw by the dotted lines running *e* of the cylinders and connects the steam ports *d*, as seen from the other linders, and the steam is let the usual way. *l, l*, the crank of the engine of the paddle wheels. The admitted through the steam *f*, forces the pistons, *b, b*, steam is then turned off denser in the usual way, cessary to describe, at the he steam is admitted by *rt, g*, between the pistons, a forced up and the other ove action is then repeated, connected to the cranks by *s*, connecting rods, *i, i, i, i*, or paddle wheel is set in

then observe, that I do not

confine myself to the operation of two pistons in one cylinder, as more might be employed; but two appear to be sufficient. The same principle of two or more pistons in one cylinder is applicable to engines of high pressure principle. In witness whereof, &c.

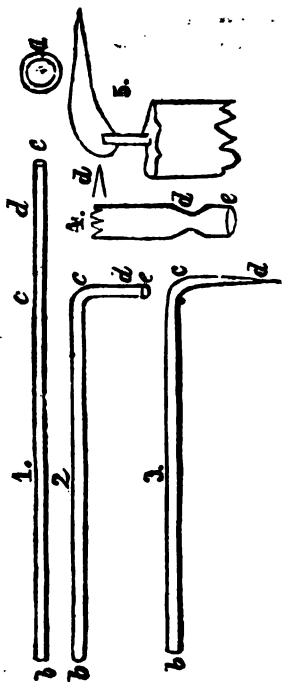

Enrolled June 4, 1835.

[From the London Mechanics' Magazine.]

ON THE PRACTICE OF THE BLOW PIPE.

—The introduction of the use of the blow pipe in practical chemistry, may be regarded almost in the same light as the application of the power of steam to the purposes of commerce. If the latter has increased our national resources, and forwarded the interests of mechanical science, by economising the labor and expenditure which were formerly bestowed, the former has, in like manner, advanced the cause of chemistry, and its dependent sciences, by reducing the expense of fuel, time, and material, which were originally required in qualitative analysis. If the mechanic can now produce, with comparative ease and expenditure, an article which, before the introduction of the steam engine, would have required the labor of many weary days, and the consumption of much valuable material,—the modern chemist can, with equal facility, detect the constituent principles of a body, which, before the invention of the blow pipe, would have called in requisition the unremitting exertions of many tedious nights, and the profuse employment of many rare, and, perhaps, valuable substances. In fact, by the introduction of this simple, yet invaluable instrument, the modern chemist can, by his parlour fireside, and with a common candle, perform those operations, to accomplish which, the ancient and less gifted philosopher would have been compelled to resort to the unhealthy atmosphere of a laboratory, and the continued pouring over an intensely active fire. The blow pipe, according to Bergman, had been long employed in the arts by jewellers and others, for the purpose of soldering, before it was applied to the purposes of analytical chemistry and mineralogy, by a Swedish metallurgist, of the name of Sval, about the year 1733. This individual, however, appears to have left no written account of the method which he adopted in the application of this instrument. The researches of Cronstedt, Bergman, and Galin, and, more recently, those of Berzelius and Faraday, have concurred in raising this instrument to the eminent station of utility which it at present enjoys. In the work of Berzelius on this subject, will be found ample instructions for the pursuit of mineralogical and analytical chemistry; and in the "Chemical Manipulations" of Dr. Faraday, the student will meet with copious directions for applying this instrument in the bending and blowing of glass, in practical chemistry. For the former purpose, the mouth blow pipe possesses undeniable advantages; but for the more fatiguing operations of the latter, the table, or hydrostatic, blow pipe will be found more

nient. The advantages possessed by the mouth blow pipe over all those instruments whose blast is produced by artificial means, consists in its portability, economy, and the facility of immediately suspending or modifying the blast. "The chemist does not possess," says Dr. Faraday, "a more ready, powerful, and generally useful instrument, than the mouth blow pipe, and every student should early accustom himself to its effectual use and application."

The supply of a continued stream of air, is the chief difficulty which a beginner experiences in learning the use of this instrument, and this difficulty is, I apprehend, not unfrequently increased by the employment of a blow pipe with too large an orifice, in the first instance. The following method of constructing, will, I have reason to believe, be found more efficacious than any other hitherto published, since I have, by its means, succeeded, in less than half an hour, in communicating the art of blowing to a class of several persons. Let the pupil procure a tube of glass, *b c*, about thirteen inches long, and of the size and thickness of *a*. Let him now thoroughly heat the tube at *c*, about two inches from the end, by slowly turning it round in the flame of a candle, or, what is better, a spirit lamp. When he finds that it will yield, let him bend it gradually till it has acquired the position represented by fig. 2. The part *d* is now to be heated in the same manner, till it is found soft enough to draw out, when the part *e* must be gradually withdrawn, as represented in fig. 4, till it terminates in a point; this point should be held for a minute or two in the point of the flame, in order to thicken it, and when cold it is to be ground away with a file, until the smallest possible orifice is

visible. The pupil will now be possessed of a blow pipe (fig. 3,) with an exceedingly minute jet; and if he puff out his cheeks to the utmost, and place the end *b* within his lips, while the other extremity is held within a short distance of a candle, (fig. 5,) he will, after a few trials, find no difficulty in keeping the flame continually, and without intermission, horizontal and clear. The operation which he will be required to perform, in order to keep his cheeks constantly distended, notwithstanding the escape from the jet, cannot easily be described, but will naturally offer itself when the expenditure of air is very small. When the pupil has succeeded in keeping up a constant blast for several minutes, by this means, he may enlarge the aperture by degrees, practising between each enlargement, till he finds he can manage a blow pipe with a large bore, when he should purchase one of brass, with an ivory or tinned mouth piece, for general use.

Among the numerous hydrostatic blow pipes which have already appeared in your Magazine, the pupil who wishes to manufacture his own apparatus, may assuredly find one which will form a substitute for the table blow pipe. I subjoin a

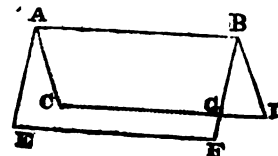

plan for one, which may be constructed, at a trifling expense, by almost every student, and in situations where the articles of workmanship requisite for the construction of a more complicated machine, could not be procured. *a b* (fig. 6,) is a common pail, about half filled with water; *c* is a large flower pot, inserted, and fastened in by any convenient method; *d* is a mouth blow pipe, (glass would do on an emergency,) fastened in air tight, with a cork and lute, to the hole at the bottom of the flower pot; *e* is a bent tube of glass, or metal, terminating under the mouth of the flower pot. When air is blown in from the mouth at *e*, it rises into the body of the internal vessel, and displaces the water, which, in endeavoring to regain its level, forces out the air from the jet of the blow pipe, with a force proportioned to the height of the column of water displaced.

*On the Resistance of Fluids; by GEO. W. KEELY, Professor of Natural Philosophy, in Waterville College.*

SIR,—I perceive in No. 55 of the Journal, that Professor Wallace has announced a new measure of the resistance of a fluid in a direction perpendicular to a plain surface moving in it, viz: That it is as the sine of the inclination of the plane. Permit me to state my reasons for adhering to the old doctrine, that the perpendicular resistance is as the square of the sine of inclination. It is well known that the latter measure has been deduced from the alleged facts that the number and the force of the resisting particles vary as the sine of the inclination. If it be true that the resistance to a plane

surface moving in a fluid is as the number of particles it strikes in its course, and that the number of particles in any indefinitely thin fluid lamina is as the area of that

lamina, (neither of which we think Professor W. will deny,) it follows that, if *BD* be a section of a plane inclined to the direction *BA* of its motion, and *BF* an equal section of an equal plane perpendicular to the same direction, the number of particles *BD* will strike is to the number that *BF* will strike in the same time, as the parallelogram *ABCD* is to the parallelogram *AEFB*; and the resistances are therefore, on this account, as *BG* is to *BD*, or as the sines of the inclinations of the sections; the resistances to the planes are of course in the same ratio.

Now this familiar demonstration would seem to settle the question; but Professor Wallace argues, "that the number of particles striking the plane does not depend on the breadth of the fluid column *BG* *BF*, but on the surface of the plane, because the particles that act on the plane are those in contact with it, and therefore their number is as its superficial area." Now, admitting it to be true that the number of material particles in contact with the plane, at any instant, is the same, whether it be perpendicular or inclined to the direction of the motion, it does not, we think, necessarily follow that the number of particles struck in any given time will be the same. But neither is it evident that the number of particles in contact with the plane is the same for every inclination of the plane. The burden of proof, however, seems to lie with Prof. W. He has assumed the general physical fact that the number of particles in contact with the plane, at any instant, is the same for any position of the plane, and he has deduced an inference, not formally expressed, indeed, but surely implied, otherwise the argument is worth nothing, that the number of particles struck in any given time is as the number in contact with the plane at any instant. Now we think the fact and conclusion may very safely be denied, and it becomes Prof. W. to show that they are consistent with some hypothesis respecting the form and relative position of the ultimate particles of a fluid body. In any hypothesis, we believe the following positions will be found to hold:

First. Whether the number of particles, at any instant, in contact with the plane, in different positions, is the same, depends wholly on the hypothesis.

Second. If the number is the same in different positions, it will be found that the number of fluid strata struck in any given time, is as the sine of the inclination.

Third. If the number is not the same, then it varies as the sine of the inclination, and the number of strata struck will, in any given time, be the same.

If Prof. W. can devise any hypothesis with which these positions do not agree, we will allow he can disturb our belief in the truth of the law of the square of the sines.

The wide difference between the results of observation and those of the old theory, would tend rather to dissuade us from admitting the truth of the new, when we consider what important physical circumstances are and must be omitted in the conditions.—[Silliman's Journal.]

# AMERICAN RAILROAD JOURNAL, AND ADVOCATE OF INTERNAL IMPROVEMENTS.

PUBLISHED WEEKLY, AT No. 35 WALL STREET, NEW-YORK, AT FIVE DOLLARS PER ANNUM, PAYABLE IN ADVANCE.

## AMERICAN RAILROAD JOURNAL.

NEW-YORK, DECEMBER 5, 1836.

THE RAILROAD JOURNAL, is now near the close of its 4th volume, and it may not be amiss to ask its readers, whether it has, thus far, been of any use to them individually, or to the cause it advocates? Has it been the medium of communication to you, at any time, of valuable information, by means of which, the works under your care, or in which you may be interested, have been improved, facilitated, or the expenditure reduced? Has it tended to disseminate, amongst the people generally, information which will promote, and extend, the construction of works of Internal Improvement throughout the country?

If you have been at all aided, or benefited by it—or if it has exerted the least favorable influence upon community, then has my labor not been in vain; but if neither of these have resulted from its publication, then I have indeed labored for naught, inasmuch as it has not only not accomplished the main object of its publication—the aid of the cause of Internal Improvement—nor yielded me a dollar, over and above its expenses, during the whole period of its publication; but, on the contrary, it has drawn heavily upon other resources, to sustain it thus far—which now induces me to adopt new measures, and to make one more effort to sustain it, which will, if acquiesced in by its patrons—and thus far there has not been

a dissenting voice, amongst those with whom I have been able to consult, but all have cheerfully recommended the measure—not only enable me to increase its usefulness and value, by devoting my whole time to its columns—and at the same time derive, as I must hereafter, if I continue to publish it, some pecuniary advantage from it. I stated, in number 26, that after the close of the present volume, the work would be reduced from 16 to 8 pages per number; but the rapid increase, and astonishing progress, of Railroads in this country, together with the advice of many of its earliest patrons, has induced me to continue to publish it in its present form, of sixteen pages each number—publish a greater amount of information, in relation to Railroads, Canals, &c. &c.—and hereafter to charge five dollars a year for the work.

This increase of price is resorted to only with a view of sustaining the work, and enabling me to devote my whole attention to it; and that I may do so, I have relinquished other, and the heaviest part of the, business in which I have been for many years engaged. I trust, therefore, that its readers and patrons, who, if any, have been benefited by its publication, will not desert it, but continue it one year more, on my, if not on their own, account. Try it one year at five dollars—then—as many more as it may deserve.

D. K. MINOR.

New-York, Dec. 5, 1836.

**SNOW ON RAILROADS.**—It has often been urged against Railroads, that they would be obstructed by snow, in the northern States; but with what force and truth, these objections have been made, may be seen by the following statement, in relation to the performance of the engines on the Boston and Providence Railroad.

The recent snow fell to the depth of about nine inches, on the Boston and Providence Railroad. On the following day, two locomotive engines, attached, being provided with ploughs, so constructed as to turn the

snow off on either side, were started from Boston, and reached Providence in five hours, having met the train from that city, twelve or fifteen miles on its way towards Boston, enabling the latter to go through in four hours, and accomplishing both passages in nine hours, or at the rate of more than nine miles per hour. This experiment gives assurance, that no ordinary depth of snow can obstruct the travel on this road, more than a few hours.

**COMFORT TO TRAVELLERS.**—The Boston and Providence Railroad Company, have furnished several of their cars with small cast iron stoves, in which anthracite coal fires have been kept, during the recent cold weather, affording a degree of comfort to travellers, which goes far to remove the objections to journeying at this inclement season of the year. We are informed that all the cars, on this Road, that are sufficiently large to admit of this improvement, will be fitted up in the same manner, with as little delay as possible.

**SOUTH CAROLINA AND OHIO RAILROAD.**—We have had on our table, for some time past, a pamphlet with the following title page, viz: "RAILROAD FROM THE BANKS OF THE OHIO TO THE TIDE WATERS OF THE CAROLINAS AND GEORGIA," but a press of other matter, previously in hand, and numerous calls upon our time, have prevented us from giving to it that attention which the importance of the subject deserved; and we are now only able to give it a passing notice, by way of apology, for the apparent want of attention with which it has been treated—and for the purpose of calling attention to the very interesting report which was made by a committee, composed of Dr. Daniel Drake, T. W. Bakewell, and John S. Williams, Esquires, to a meeting of the citizens of Cincinnati, on the 15th of August last, and which we shall endeavor to publish in our next number, together with much other interesting matter, in relation

tion to the works of internal improvement now in course of construction in this country.

We cannot, however, leave this subject, without giving our readers a short extract from the report, and then, by adding a few remarks, in relation to the probable results which will naturally flow from the completion of this *GRAND* scheme—of competing with the north for the trade of the *Garden of the World*—the region of the Ohio and Mississippi.

The distance between Cincinnati and Charleston, on a straight line, is about 500 miles. South Carolina, however, has already made a Railway, 135 miles in length, to Hamburg, on the Savannah River, opposite Augusta, nearly in the direction of Cincinnati; and the contemplated Railroad to Paris, in Bourbon county, Kentucky, exactly in the course of Charleston, (for the construction of which there are, in the opinion of your committee, a great many weighty reasons of a local nature,) would have a length of about 90 miles, thus leaving but 475 miles to complete this new and most important communication, between the interior and the sea-board of the south.

The middle of this main trunk would be intersected by the projected Railroad from Richmond, Virginia, via Lynchburg, to Knoxville, in East Tennessee, by which the Old Dominion would acquire a new channel of intercourse with her daughter, Kentucky; and also with several of the States formed out of the North-Western Territory, which was once her property,—travelling from the West to southern Virginia, being thus restored to the route which it took in the infancy of our settlements.

By an extension west, to Nashville, of the Richmond, Lynchburg, and Knoxville Road, the whole of central and northern Tennessee would be enabled, with great facility, to communicate with the Carolinas and Georgia, by means of the southern extremity, with the State of Ohio, by means of the northern extremity of the great highway under consideration.

From the maritime terminations, and the lateral branches of this extended trunk, let us turn our attention to the northern or continental connections which it would establish.

These would extend, both east and west, from Cincinnati, for several hundred miles, and through every intervening northern point. First, the Ohio River would connect it with western Virginia and western Pennsylvania—embracing the valleys of the Great Kenhawa, Monongahela, and Alleghany rivers: Second, the Ohio and Erie Canal, from Portsmouth to Cleveland, already finished; the Miami and Maumee Canal, in progress from Cincinnati to Lake Erie, uniting at Fort Wayne, with the Erie and Wabash Canal of Indiana; and the Mad River and Sandusky Railroad, from Dayton to the Lake, the execution of which has commenced, would connect it with the entire chain of northern lakes, from the Falls of Niagara to the Straights of Mackinac, and even Green Bay, on the western shore of Lake Michigan, including the eastern border of Wisconsin Territory, north or maritime Illinois and Indiana, the whole of Michigan Territory, a part of Upper Canada, and the centre and northern declivity of Ohio: Third, the Wabash and Erie Canal, just mentioned, and the Railroad from Lawrenceburg, at the mouth of the Great Miami, to Indianapolis, already begun,

would carry its advantages into the depths of Indiana: Fourth, the Ohio River from Cincinnati to the Mississippi would connect it, beneficially, with south and west Illinois, Missouri, and the immense extent of unsettled territory watered by the upper Mississippi and Missouri Rivers. Thus the proposed main trunk, from Cincinnati to Charleston, would resemble an immense horizontal tree, extending its roots through, or into, ten States, and a vast expanse of uninhabited territory, in the northern interior of the Union, while its branches would wind through half as many populous States on the southern sea-board.

Thus it will be seen, that, by the construction of less than 600 miles of Railroad, Charleston would become more easy of access to the Valley of Ohio, than either New-York or Philadelphia; and, at the same time, she would have a direct connexion with all the numerous Roads, and Canals, and Rivers, west of the Alleghanies—an event which, if realized, and we doubt not, will place her, and the State, of which she is the commercial emporium, amongst the most flourishing in the Union. But South Carolina will not be the only Atlantic State benefitted by its construction. Its branches will reach Savannah, in Georgia, Wilmington, in North Carolina, Norfolk, in Virginia, from Abingdon, down the Valley of Roanoke, to connect with the Portsmouth and Roanoke Railroad, now rapidly progressing; and also, if the citizens of Richmond are awake to their own interest, another branch will find its way up the Valley of James River, to connect with and intercept the northernmost branch, which will eventually terminate in the most enterprising, or Monumental City of Baltimore.

However visionary the project of a Railroad, from Cincinnati to Charleston, S. C., may appear to the thousands who do not take time to estimate the coming greatness of this country, and the importance of such avenues to accommodate the business of the most enterprising people in the world, we not only believe it *feasible* and *probable*, but also deem it *necessary*, and as *sure* of ultimate accomplishment, together with *all* the appendages, at its southern extremity, here enumerated, as we do that the population of the Valleys of the Ohio and Mississippi will increase, or that the people of South Carolina will continue to raise cotton.

It is indeed now, or will soon be, a matter of necessity to open a great thoroughfare between those valleys and the Southern Atlantic States, for their mutual accommodation—as the intercourse between them will necessarily greatly increase, and become too great to submit to its present circuitous routes; and it is, therefore, in our opinion, a fortunate move, and a happy omen for its success, that Cincinnati, the Queen of the West, and destined to exercise a powerful influence upon the project, has spoken upon the subject, in a manner which insures her future devotion and support.

THE NORTH RIVER is closed to Commerce—and the steamboats proceed no further than Hudson.

#### *Ninth Annual Report of the President and Directors to the Stockholders of the Baltimore and Ohio Railroad Company.*

The time has again arrived, when it becomes the duty of the President and Directors to lay before the stockholders, the proceedings of another official year. During this period, the main stem of the road has been completed to a point opposite the town of Harper's Ferry, and the branch to Washington has been opened for general travel. Various improvements have been made in the machinery and motive power; and additional views have been suggested by the changing circumstances and increasing ramifications of the system of internal improvements now prosecuting in all directions throughout the country. The purpose of the present report will be to present these various matters in order and in detail.

At the date of the last annual report, the graduation of the main stem, between the Point of Rocks and Harper's Ferry, was drawing to a close; and soon after, the difficult passes of the Potomac, undertaken by the Chesapeake and Ohio Canal Company, and the intermediate portions, let out by the Board of Directors, were simultaneously completed. All possible expedition was used in laying down the rails, and by the 1st of December, 1834, the entire line, from Baltimore to the eastern abutment of Wager's Bridge, opposite the town of Harper's Ferry, was opened, with appropriate formality, for general use. The machinery, necessary to facilitate the transit of flour and other produce from the Canal to the Railroad, was at once erected, and the increase in the business of the Company, which immediately followed, even exceeded the anticipations that had been previously formed, and called for every exertion to furnish the requisite means of transportation. Notwithstanding the difficulties, which at all times attend the diversion of trade into new channels—the temporary and most inconvenient location of the place of transit, the great height between the Railroad and Canal, the want of proper shelter, the contracted space allowed for labor and handling, where the Canal, the Railroad and the Turnpike are all crowded into a width of less than one hundred feet, and the unavoidable delays in forwarding to Baltimore, which occasionally took place,—notwithstanding all this, the business done from Harper's Ferry continued steadily to increase; and although the total amount was necessarily divided with the magnificent Canal along side, yet the Board of Directors had every reason to be satisfied with the portion that was given to the Railroad. This state of things has continued up to the present time, during the business seasons, and there is no reason to anticipate that it will not be permanent. The Board must here acknowledge how much is due to the liberal policy of those of the merchants of Baltimore to whom the new trade has been directed, and who are entitled alike to the thanks of the Company and the community, for the efforts which they have made to render this market popular and attractive, in those sections of country, where, hitherto, it has been but little known.

Various circumstances prevented the Board, for some time, from taking measures to connect the main stem with the Railroad of the Winchester and Potomac Company. They finally determined, however, to construct a substantial viaduct across the Potomac, on the prolonged trace of the Winchester road, and capable of permitting the passage of locomotive engines,

with their usual trains, to which the present bridge is wholly incompetent. Contracts for this purpose have already been entered into, and it is expected that the viaduct will be completed early in the ensuing summer. The piers, six in number, with the abutments, will be of undressed masonry, and the superstructure of wood. Its entire length, including the portion crossing the Chesapeake and Ohio Canal, will be 830 feet. When a permanent connection is formed between the main stem and the Winchester and Potomac Railroad, the Board will, after the experience of a few weeks, be enabled to determine, better than at present, upon the arrangements to be made to accommodate, to the greatest advantage, both the trade which, descending the Canal, may be bound for Baltimore, and that which may be intended for the same market from the valley of Virginia.

The Winchester and Potomac Railroad Company are now engaged in erecting the southern abutment of the river viaduct, and in the graduation of their road through the town of Harper's Ferry. It is expected that the entire line, from Winchester to the river, will be in readiness for use during the present year; so that, in a short time, there will be an uninterrupted Railroad communication between Winchester and Baltimore, a distance of 112 miles, on the most direct route to the cotton growing districts of Tennessee and the South West—pointing towards the great Nashville and New-Orleans Railroad, and aiming at very near the centre of the James River and Kenhawa improvements. The extension of the Railroad from Winchester to Staunton is all that is necessary to secure to Baltimore a large portion of the trade of the great valley and the vast region that lies beyond its western boundary.

The views heretofore expressed by the Board of Directors, in regard to the business that would be created by the Road along its course, have been fully realized; and there is daily evidence that its advantages are not confined to its termini alone, as was once supposed would be the case, but that these advantages will extend to the country on either side. The increase of the receipts of the transportation department is the best criterion by which to judge of the value of the work, as well to the public as to the stockholders; and by referring to the report of the proper officer it will be found that the receipts of the present year, exceed those of the last year by the sum of \$57,931.62, while the expenses have only increased \$23,341.93 during the same period. The gross revenue of the year ending October 1st, 1835, is 263,363.10; the expenses for the same period are \$156,304.39, leaving a net revenue of \$107,163.71.

Of the expenses of transportation, a very large portion is rendered necessary by the four inclined planes at Parr's Ridge. When the main stem was originally located, it was designed to pursue the only plan then known, and to effect the passage of the ridge by means of stationary engines; and, in the mean time, horse power was used as the most economical within certain limits. Since then, however, the performances of the locomotive engines, built by the Company, have proved that it is perfectly practicable to construct a Railroad across Parr's Ridge, upon which locomotive engines with their usual trains, may pass in either direction, without the assistance of stationary power, being aided, when necessary, by extra locomotives, kept on the section for the purpose. The great saving, both in time and expense, which will result from

the change thus suggested by the recent improvements of the machinery of Railroads, has made the relocation of the Road at the Ridge a prominent subject of consideration with the Board, and it will be one of the objects claiming their early attention.

Among the items of expenditure, that of repairs upon the main stem has been a heavy one, and will continue to be so. It must be understood, however, that these repairs relate to the rail track alone, the masonry, upon recent inspection, having required but a trifling renewal of the pointing here and there, to make it as perfect as the day it was completed, and the graduation generally requiring but little attention to keep it in good order. In the outset of the undertaking, the costliness of the English rail prevented its being adopted; so that, without any thing to guide them, the Board of Directors had to experiment upon such materials as were at hand. The wooden string piece and slipper, with a plate rail of 2½ by 5-8 inches, were first laid down; then stone blocks were substituted in place of the wooden sleeper; then the log rail was used; and then the continuous stone string piece was devised and considered as the perfection of the system. Experience proved that of these four modes, the first was decidedly the best, and the last, decidedly the worst, of all. Under such circumstances, and when it is considered too, that in the haste of construction, indifferent timber had often to be used, and, sometimes, even laid down green from the adjacent woods, it is not to be wondered that the item of repairs should be considerable. Great care, however, is now taken to employ none but the best materials in renewing the unsound portions of the Railway, so as to reduce, before long, this item to its minimum.

Another item of expenditure, which the Board hope will be but temporary, grows out of the necessity of either dispensing with the use of steam from the Point of Rocks to Harper's Ferry, or building a board fence along a portion of the distance, between the Railroad and Canal, so as to hide the Locomotive Engine from the horses tracking boats on the towing path. The act of the Legislature of Maryland, upon which the agreement with the Canal Company for the construction of the Railroad to Harper's Ferry was based, contained a clause to the above effect, inserted at the instance of the Canal Company, under the apprehension that the noise and unwonted sight of the engines, would alarm the horses and occasion accidents. The erection of the board fence, which would make the Railroad a great ditch for the snow and wash from the hills, being out of the question, the Board having been obliged to dispense with the use of steam, and keep up a stock of horses for the distance in question. It is hoped, however, that the Canal Company will consent to remove the restriction here alluded to, inasmuch as the experience of the transportation on the Baltimore and Ohio Railroad, where steam and horses have been long used at the same time, and are constantly meeting on adjacent tracks, shows the objection to be unfounded, and the danger to be imaginary. While on this subject, the Board cannot suffer the opportunity to pass, without stating that the kindest feeling prevails between the two companies, and acknowledging the liberal facilities afforded by the Canal Company in the construction of that part of the viaduct at Harper's Ferry which crosses the Canal.

Soon after the publication of the last annual report, the Board of Directors caused that portion of the Washington branch, within the District of Columbia, to be put under contract as far as the city boundary; and upon the meeting of Congress, they made application to that body to remove the restriction confining them to the lines of the streets as laid down in the city plan. This was not granted until the close of the session; and the negotiation with the corporate authorities of Washington, in order to fix the precise route, although facilitated by them in the most liberal and friendly manner, having created a still further delay, it was not until late in the spring that the contractors could commence operations within the city. Notwithstanding, however, the entire line from the main stem to the Pennsylvania Avenue, was formally, and with suitable ceremonies, opened for travel on the 25th of August, a portion of it, as far as Bladensburg, having been in use from the 20th July previous.

In the agreement entered into with the corporation of Washington, it is stipulated that the road shall be extended across the Pennsylvania Avenue, and passing into Missouri-street, reach the Chesapeake and Ohio Canal at the Basin on Sixth-street. This would have been done at the same time with the rest of the work, but for the want of authority to pass over a public reservation lying in the route. As soon as this difficulty is removed, the stipulation above mentioned will be complied with.

The natural obstacles to the construction of the Washington branch, have been unusually great, owing to its course lying at right angles with the direction of the streams; occasioning heavy cuts and embankments alternately throughout nearly the whole distance. In all cases, viaducts of plain yet solid masonry have been built; and, in the adoption of a form of rails, the experience acquired on the main stem has been referred to, with a view of making it as perfect as practicable. It is highly gratifying to the Board, therefore, to be able to state, that the cost for graduation, masonry, and construction of the branch, allowing for the expense of laying down a second track of rails, will fall short of the original estimate upon which it was undertaken about \$60,000. The great viaduct across the Patapsco falls also within the estimate, including all attendant expenses. The obelisk, erected at its northern extremity, is a memorial, placed there at his own expense, by the able and enterprising contractor, John McCartney, of his connection with a work which is, as yet, the most extensive of its kind in this country.

Nineteen miles from Baltimore, the Savage Railroad diverges from the Washington branch, and leads to the Savage Factory, and to most valuable quarries of granite in the neighborhood. The Company, by which it was made, was incorporated at the last session of the Legislature, and they have prosecuted their work with commendable zeal and efficiency. It is now nearly finished as far as the factory, and will soon add, not inconsiderably, to the business of the branch.

Since the opening of the Washington road, the travelling between the two cities has greatly exceeded that which the stages and other modes of conveyance formerly accommodated at the same season. The average, at this time, is about two hundred persons per diem; and it is found that numbers, to the south of Washington, who formerly came to Baltimore by the Bay route, now ascend the Potomac and make

use of the Railroad. The Board have every reason to believe, that the results of the Washington branch will fully justify the policy of taking the greater part of the stock on account of the Company.

The distance between the two cities is now performed by the Locomotive Engines, in about two hours and ten minutes, which is at the rate of near twenty miles an hour. When the portion of the main stem common to the Washington branch, between the first intersection with the Turnpike Road and the Deep Cut, shall be made less curved than at present, which is contemplated, and can be easily effected, there is little doubt that the time of making the journey will be brought within the limit of two hours, as originally proposed.

As yet, with the exception of the deep cuts, there is but a single track of rails on the Branch Road. It is the intention of the Board, however, to take steps to lay down the second track in time to accommodate the now daily increasing travel and transportation.

The increased and rapidly increasing operations of the Company have rendered it necessary to add largely to its real estate, both in Baltimore and in Washington. The Mount Clare depot, containing ten acres, and presented to the Company by the late James Carroll, Esquire, having been found insufficient for the purposes connected with the business of the Road, to which it is appropriated, the Board have recently purchased about 11 acres of the ground lying south of, and binding on Pratt-street, and immediately east of, and adjoining to this property, by which the entire quantity owned by the Company there, is increased to about 21 acres of land. Squares No. 718 and 682, and the half of square No. 574, have also been purchased in Washington, for the purpose of establishing a depot and other necessary accommodations in that city, as has also been a lot on the Pennsylvania Avenue, at the angle where the Railroad intersects it. On the latter property there is erected a convenient three story brick house, now occupied as a ticket office, and also a commodious car-house. The wants of the Company have rendered it necessary to enlarge the foundry at the Mount Clare depot, and to appropriate for a boiler shop the car-house first built there. An engine house, with accommodations for nine engines, has been erected upon an improved and satisfactory plan—a large car-house, of wood, containing three tracks and one hundred and fifty feet in length, has also been built, and another, of brick, two hundred and eight feet long, is now in progress, as is also a new smithery and repairing shop. When the number and value of the passenger cars, belonging to the Company, are considered, these arrangements for their safety and preservation, will not be thought superfluous.

An arrangement has been made with the Water Company, for an ample supply of water at the Mount Clare depot, where the well water was found to produce a deposit injurious to the boilers of the engines. Arrangements have also been made for water stations along the line of the Washington branch, and on the main stem, and permanent and convenient fixtures are now being erected at the proper points, to secure, at all times, a prompt and ample supply.

With the machinery and motive power employed by the Company, there is every reason to be satisfied; and the results of

experience confirm the Board of Directors in the belief, that the engines used by them, differing as they do essentially from the English engine, are not only better adapted to the curves of the main stem, but are more powerful, with equal velocity, on the comparatively straight and level branch road to Washington. The principle of these engines has been fully explained in former reports. Numerous improvements in the details of construction, have been made during the past year, aiming at simplicity and durability; and there is little doubt that results, which are now daily furnished on the Washington branch, will, before long, give the constructors of the Company's engines the same advantages, which the experience of the Liverpool and Manchester Road has afforded in the workshops of England. The anthracite coal continues to be the only fuel employed, and is found to be far preferable to any other. The heat is intense—the fire requires replenishing but seldom—no smoke is emitted, and no sparks are produced, to the peril of the clothes of passengers, baggage or merchandize. Neither is it observed that the fire bars are less durable, or require renewing oftener, than in engines where either wood or coke is used.

[Here follow three paragraphs, which were inserted in our last number.]

When thus adverted to what has been accomplished in the improvement of the locomotive engines of the Company, it would ill become the Board to omit paying a tribute of merited respect to the memory of Phineas Davis, the lamented individual who so largely contributed to the results here indicated. On the 27th of September last, he, having completed a new engine, availed himself of the occasion of trying it, to take his numerous workmen on a visit to Washington. On his return, the engine striking the end of a rail, which the breaking of the iron chair had permitted to get out of alignment, it was thrown off the track, and being at the time on the tender, he was dashed forward against the engine, and instantaneously killed. No other person was injured.

Phineas Davis was the first, who constructed an engine, capable of being used on the Road, in which anthracite fuel was successfully employed. With untiring patience, he bore disappointment after disappointment; and the eminent and splendid results, which ultimately rewarded his efforts, are ample testimonials of his genius, and will identify his name, most honorably, with that great system of internal improvement, which is yet to work so many and such important changes in the relations of society. Of a quick and clear conception, in matters relating to his profession, he possessed a calm discriminating judgment. The warmth and energy of inventive talent were tempered by a prudent foresight and great practical skill. He seldom, therefore, took a step, which was not a secure one; and the success of his suggestions, when put into practice, gave them, from the first, almost the same weight as if they had been the dicta of experience. His private worth and unassuming manners, were not less remarkable, than his rare abilities. The Board deeply regret his loss, and hold his memory in sincere and respectful consideration.

The eight wheeled passenger cars, mentioned in the last annual report, have been fully tested, both on the Washington branch and on the main stem; and are found to combine safety, convenience, ease of motion, and economy. They are considered

far preferable to the common four wheeled cars in all these particulars, and have been permanently adopted by the Board. The same plan has been applied to the burden cars, with equally favorable results.

The machinery, generally, of the Company, has been much improved during the past year. The casting of the wheels has been brought to a perfection which removes all fear of accident from their breaking, even at the highest velocities. The revolving platforms, invented by John Elgar, and used at the Mount Clare depot engine house, are superior to any heretofore constructed. The present brakes for passenger cars, suggested by Evan Thomas, have proved most efficient and durable. A new form of blowing apparatus, combined with a contrivance for heating the water before it is pumped into the boilers, has been invented by Ross Winans, and has produced increased efficiency. In fine, the Board have every reason to be satisfied of the policy of having their machinery manufactured in the shops of the Company, where suggestions, growing out of the experience afforded on the road, can at once be made available.

The number of locomotive engines now in use is seven, of passenger cars forty-four, of which twenty-five are on eight wheels, and of burthen cars one thousand and seventy-eight, of which forty-eight are on eight wheels.

The necessity of providing for the punctual payment of the interest on the loan made to construct the Washington branch, together with a determination to pay off the arrears of interest on loans made to anticipate instalments, during the construction of the main stem, have obliged the Board to postpone, heretofore, the payment of dividends. The completion of the Washington branch, however, now enables the Board to commence, and to continue, without interruption, the payment of semi-annual dividends. And after carrying \$75,000 to the debit of profit and loss, to make good deterioration of the Railway and machinery, they have declared a dividend of one and a half per cent. for the last six months.

It now remains for the Board of Directors to advert to their relations with other works of internal improvements, and to present such views with respect to the further progress of the Baltimore and Ohio Railroad, as have been suggested during the past year. Plans which, not long since, would have been considered as fanciful chimeras, are hourly assuming the shape of effective undertakings; and rapid as have been the strides taken in the improvement of Railroads and their machinery, the possibility of much greater perfection is now even more fully admitted than it was in the earliest periods of the system. A Railroad which is constructed in an old community, and that passes through a densely peopled region, may have its fortunes foretold to it in the outset: but one whose course lies through a new land, teeming with all the elements of agricultural and commercial greatness, which connects immense rivers flowing in opposite directions, whose rich valleys have been, but recently, in comparison, laid open to the full tide of emigration, such a Railroad is found, at each step of its progress, involved in new relations, and it becomes difficult to predict results which future circumstances can alone determine.

Soon after the publication of the last an-

nual report, application was made to the Board, on behalf of a large and highly respectable meeting of the citizens of Chambersburg, requesting that an engineer might be deputed to examine the country between that city and the main stem of the Baltimore and Ohio Railroad, at a point not far below Harper's Ferry. The Board accordingly directed B. H. Latrobe, Esq., then assistant engineer in the Company's employment, to perform the required service; and he made a reconnaissance of the proposed route, with a survey of part of it, passing through Hagerstown, leaving Boonsborough to the north, and descending the valley of Israel's Creek to the Potomac. The entire distance was about 45 miles, the greater portion of which was found to be extremely favorable, and the average cost per mile for a single track was estimated at \$10,000. One inclined plane was found to be necessary to overcome the rapid rise from the margin of the Potomac towards the summit level. No steps have yet been taken in the prosecution of this road: but it is not improbable that, before long, a communication between Baltimore and Chambersburg, by the proposed route, will be effected.

Within the last year, the Baltimore and Port Deposit Railroad Company, whose work unites with the main stem of the Baltimore and Ohio Railroad, at the eastern part of the city of Baltimore, have commenced active operations, and the graduation, as far as the Gunpowder River, is understood to be nearly completed. It is supposed that this Road will be finished to Havre-de-Grace during the ensuing year. By the same time, the Railroad now being constructed from Wilmington to the Susquehanna, will also be ready for use; as also the Oxford and Cecil Railroad, which unites with the Baltimore and Port Deposit Road at the village of Port Deposit, after passing through Lancaster county, Pennsylvania. Should the Railroad from Washington to Philadelphia, and that now in progress across New-Jersey, be completed, which there is every reason to believe will soon be the case, there will then be an uninterrupted line of Railroad communication between New-York and Washington City. From Washington to Potomac Creek, steamboats will continue, in all probability, to furnish the means of conveyance for some time: but from Potomac Creek, the Railroad to Fredericksburg, and from thence to Richmond, thence to Petersburg, and thence to the Roanoke, will prolong the system southwardly, parallel to the seaboard. Of this route it will at once be seen that the branch Road to Washington forms one of the most important links. To the westward, the main stem of the Road is already at the point of divergence of the great natural highways to the West and Southwest, where the Potomac and Shenandoah unite their waters. The extension of the Chesapeake and Ohio Canal to Cumberland, will afford an early and efficient means of approach towards the West; while the Winchester and Potomac Railroad, now nearly completed, and the Winchester and Staunton Railroad, which there is much reason to believe will be undertaken before long, will carry the system from Baltimore into the heart of Virginia, and to within sixty miles of Pattonsburg, on the line of the James River and Kenawha Railroad: so that on the completion of the latter, and the Winchester and Staunton Railroad, both of which events may be considered as not remote, there will be but sixty miles of Railroad, in addition, to make, over a favorable

country, to complete a Railroad communication with the western waters.

Looking still further forward in this direction, and warranted by circumstances that give probability to what would, not long since, have been considered as morally, if not physically, impossible, it will be found that the route above indicated affords a very direct and feasible means of forming a connection with the New-Orleans and Nashville Railroad, and thus perfecting a great chain of internal improvements from one extremity of the Union to the other. From Pattonsburg, on the James River, to Salem, passing near Lexington and Finckle, the great valley presents a good location for a Railroad; and the passage of the Alleghany chain, to the waters of New River, near Christiansburg, it is understood, offers no difficulties which may not be easily overcome without the use of stationary power. Ascending first the valley of New River, and then the ravine of one of its tributaries in a southwest direction, there is but a short distance, and a low summit, intervening between the sources of the Holston, on which is situated Knoxville, East Tennessee, at the head of steamboat navigation, not far above the point where the Holston and Clinch Rivers uniting form the Tennessee River. The prolongation of the Road down the Tennessee valley to Decatur, would unite it with the Tusculum Railroad now in operation, and complete a line which must certainly be intersected by the Railroad from New-Orleans to Nashville. It is not at all improbable that before long a Railroad will be made up the Tennessee valley, towards Knoxville, on the route here indicated. To those who doubt the completion of the communication thus pointed out, no better answer can be given than to refer to the New-Orleans and Nashville Railroad; which, from being, a brief space since, a mere speculation, is now under contract, with every prospect of early completion. If, in place of the route here indicated, the lower route, from the Roanoke, through the alluvial country, to New-Orleans, should be adopted for the Railroad connection of the North and South, the Washington branch, instead of the main stem, will receive the travel and transportation, so that the Company will, in any case, derive a full share of the benefits of the undertaking.

In their last annual report, the Board expressed their opinion that the true interest of Baltimore, and of the State of Maryland, lay in the completion of the Chesapeake and Ohio Canal to Cumberland, and the continuation, beyond that point, of the Baltimore and Ohio Railroad to Pittsburgh and Wheeling, so as to effect that communication with the West, by means of the two works, which had been so long and so anxiously aimed at. During the subsequent session of the Legislature, an appropriation of two millions of dollars was made, on behalf of the State, sufficient to accomplish the first part of this design; and it now only remains to provide the means to construct the Railroad across the mountains to complete the whole. It is hardly to be supposed that Maryland, which, in creating the Baltimore and Ohio Railroad Company, gave the first impetus to the present system of extended Railroad intercommunication, will not go forward as nobly as she has begun, and contribute as largely to the Railroad across the mountains, as she has done to the Canal which reaches only to their base. It is the completion of the entire scheme which can only justify her having embarked in a portion of it; and

when that completion depends upon herself, when an increased investment will not only be profitable in itself, but make previous investments yet more productive, it can scarcely be doubted but that the state, true to her own best interests, will furnish the necessary means.

During the last summer, Jonathan Knight, Esq., Chief Engineer of the Company, was directed, at the instance of the citizens of Wheeling, to make a reconnaissance between Cumberland and the western waters; and, inasmuch as the Charter of the Company from Pennsylvania required that the Road, if it entered that State, should be constructed to Pittsburgh, the reconnaissance was extended to the two cities. The report of the Chief Engineer will be found in the appendix. It is full and satisfactory. It proves the all-important fact, that the mountains between Cumberland and the western waters CAN BE PASSED WITHOUT THE USE OF STATIONARY POWER, BY LOCOMOTIVE ENGINES AND THEIR TRAINS: It shows that the Roads to both Pittsburgh and Wheeling are perfectly practicable; and that it is to the interest not less of those two places than of Baltimore, that both should be made. Each presents its peculiar advantages, pointing to opposite parts of a wide region, and being either in connection or juxtaposition with different systems of internal improvement still further to the west. Indeed, the completion of both is alike necessary to the perfection of the plan of western intercourse, as originally contemplated in the organization of this Company, and which the Board cannot help believing is now speedily approaching its accomplishment; and both should if, practicable, be simultaneously carried forward.

Entertaining the convictions here expressed, the Board have regarded with great interest the steps taken in Wheeling and Pittsburgh, on the subject, and have been highly gratified to find their own views corroborated by the public sentiment of those places. In looking to the means by which both works shall be completed, and considering the mutual interest of the parties in the undertaking, it has appeared to the Board that the expense should be joint: the State of Maryland, the city of Baltimore, and individual subscribers furnishing the portion required to make the main stem to the point of divergence, and Pittsburgh and Wheeling furnishing the portions equal to the expected cost of their respective branches. The total expense has been roughly estimated at about \$4,600,000, of which Wheeling, some time since, has tendered a subscription of \$500,000. The Board of Directors, vital as they consider the subject of western intercourse, must bear in mind, nevertheless, the extent to which the people of Baltimore have already embarked in it, the probability of further contributions from the same source, and the prospect of receiving that aid from the State which is essential to the object. Of the deep interest which Baltimore now has in the undertaking, and which is, in truth, the interest of the State, the Board have spoken fully in their former reports; and they cannot but believe, that, when it shall be ascertained that a portion of the capital, equal to the cost of their respective branches, will be subscribed in the cities of Pittsburgh and Wheeling, that the State of Maryland, the city of Baltimore, and individual subscribers, will be found ready to contribute the balance. Without some such assurance as is here intimated; without, indeed, being satisfied that the Railroad, when once commenced beyond Cumberland,

would be finished without delay to the Ohio and Pittsburgh or Wheeling, or both, it would not be advisable to make the commencement; for it is only the connection with those cities, and the trade and travel that would be the consequence, which can justify the undertaking. There are some designs so noble and important, that their mere suggestion is sufficient of itself to render their accomplishment certain, notwithstanding what may appear at the time to be disheartening difficulties. The design of western intercourse here indicated is one of these; and the question now is, not whether it shall ever, and remotely, be completed, for of that there can be no doubt, but whether, by prompt and vigorous action, it shall be urged forward without delay, so as to insure the advancement of Baltimore to prosperity, *pari passu* with the other cities of the land.

Admirably situated, as Baltimore is, at the head of the Chesapeake, and in closer proximity to the valley of the Mississippi than any other of the Atlantic cities, all that is necessary to insure her rapid growth in wealth, power and importance, is united effort among her people, aided by the State of which she is the commercial capital. The Susquehanna Railroad from the North—the Washington Branch from the South—the Port Deposit Railroad from the East, and the main stem of the Baltimore and Ohio Railroad from the West, may be considered as so many great arteries, whose prolonged extension and spreading ramifications tend to increase and secure the healthy and vigorous growth of the city which may be termed the heart of the system.

For a statement of the receipts and expenditures of the Company during the past year, and for an exhibit of its general fiscal concerns, the Board refer to the report of the Treasurer.

By order of the Board of Directors,  
P. E. THOMAS, Pres't.

October 1, 1835.

### RAILROAD INTELLIGENCE.

The following letter from a gentleman in Georgia, shows that another of the "Old Thirteen" is in reality aroused from her torpor—not that this is the first evidence, for that was given in the *Augusta and Athens Railroad*—which, we are gratified to say, is progressing rapidly. The prospect now is, that Georgia will not be behind any of the other States, with her works of Internal Improvement—as we will endeavor to show at an early day.

Forryth, Nov. 19, 1835.

Dear Sir,—The State of Georgia is at last arousing from her lethargy on the subject of Internal Improvements.

A Charter has been granted for a Railroad from this place, to Macon, a distance of 25 miles; the books of subscription have been opened, and all the stock taken up in one day. The Directors have been elected, and steps taken to insure the speedy commencement, and vigorous prosecution of the work to its completion. This road will only be a small link in the chain of internal communication through the State. A bill of amendments to a Charter which was granted two

years since, for a Railroad from Savannah to Macon, is now progressing in the Legislature; also, a bill for a Railroad from this place to the western boundary of the State, to connect with a Road from Montgomery to West Point, on the Chattahoochee River. When all these works are completed, as they unquestionably will be, we shall then have a Railroad from the seaboard to the most eastern extremity of the State, and nearly through its centre, a distance of about 320 miles, to which add the Road from West Point to Montgomery in Alabama, 96 miles, making altogether, a distance of over 400 miles of connected Railroad. Various other Railroad projects are on foot, but none other settled upon as certain, except a Road from Augusta to Athens, which is now constructing.

I give you the above particulars, believing that you will be gratified to know that Georgia, one of the Old Thirteen, is at last awaking to the importance of her own improvement, after having so long looked with listless apathy upon her sisters' rapid strides in Canals and Railroads.

I am, very respectfully,

ALFRED BROOKS.

JAMAICA AND BROOKLYN RAILROAD.—We are gratified to be able to say that this Road is now nearly ready for use—and indeed but for the untimely extreme cold weather, which has retarded operations for several days past, it would have been completed on Monday next for the Locomotive Engine which is now ready for use.

It will be seen, says the *Baltimore American* of December 2d, that sixty miles of the Portsmouth and Roanoke Railroad are now open for travel and transportation. Connected with the road is a line of coaches to Halifax, in North Carolina, and so complete and expeditious are the arrangements, that travellers who leave Halifax in the morning may reach Baltimore on the following morning. The energy with which the Company have prosecuted their work entitles them to the highest praise.

This Company is indeed entitled to great credit for their perseverance; and they will certainly find that their best interests lies in continuing it, not only up the valley of the Roanoke, at least into Pittsylvania and even to the Blue Ridge, but also into North Carolina.

DAYTON AND CINCINNATI RAILROAD.—It will be seen, by the following notice from the *Dayton Journal*, that, "agreeably to public notice, a large and respectable number of citizens met at the Court House on Saturday evening, Nov. 21st, to take into consideration the construction of a Railroad from Dayton to Cincinnati. Jonathan Harshman was called to the chair, and David Winters and Edwin Smith appointed Secretaries."

Among others, the following resolution

was adopted, which shows the object to be a continuation of the "Mad River Railroad" to Cincinnati—a work which will undoubtedly be constructed at an early period.

Resolved, That the great and leading interest and good of the public, would be equally promoted by extending the Lake Erie and Mad River Railroad from Dayton to Cincinnati down the Miami and Mill Creek valleys, and in furtherance of this object, that an application should be made to the next legislature for a charter.

### CLEVELAND AND CINCINNATI RAILROAD.

—The Columbus, Ohio, Sentinel and Journal of the 27th ult., contains the proceedings of a meeting held at Cleveland on the 13th, for the purpose of adopting measures to construct a Railroad from that place by the way of Columbus to Cincinnati, at which the annexed, with many other, resolutions were adopted.

Resolved, That, in the opinion of this meeting, the prosperity and business of the Western country demand increased facilities of intercourse between its more commercial sections, and especially between the Lakes and the Mississippi Valley.

Resolved, That, in order to give full effect to the natural advantages of this State, and the relations we sustain to the Atlantic cities and the Mississippi Valley, in our trade and commerce, a Railroad between our two great Commercial Emporiums, Cincinnati on the Ohio River, and Cleveland on Lake Erie—is a work of the first magnitude, and, in the opinion of this meeting, the time has already arrived when the citizens of Ohio should cordially engage in the undertaking.

Thus it will be seen that Ohio, a State of less than forty years, is taking the lead in a system of Internal Improvement, which will at no distant day pervade this whole country—and make neighbors of those of whom we now know comparatively nothing, except as the citizens of distant States.

BROWNSVILLE, PA., INTERNAL IMPROVEMENT CONVENTION.—This Convention met, according to the *Wheeling Gazette* of Friday, in the Episcopal Church at Brownsville at eleven o'clock, and proceeded to its organization, by calling Gen. Andrew Stewart, of Uniontown, to the chair, and appointing John P. Kennedy, of Baltimore, and James L. Bowman, of Brownsville, Secretaries.

On motion of Mr. McCulloch, of Baltimore,

Resolved, That the delegates present furnish to the secretaries the names of the respective delegations appointed to attend this Convention.

Which being done, it appeared that the following delegates were present:

Baltimore City.—James W. McCulloch, Jacob Albert, John P. Kennedy, John S. McKim, Samuel C. Hoffman, John S. Shriver, Wm. F. Murdoch, M. S. Norman, Joshua Jones.

Railroad Delegation.—William Stewart, Baltimore County.—William Jenkins.

Cumberland.—John Gephart, John Hoyer,

Samuel P. Smith, William Lynn, David Shriver.

*Wheeling.*—Samuel Sprigg, John McClure, Redick McKee, Z. Jacob, W. B. Atterbury, Moses C. Good, John Goshorn, Samuel H. Davis, Thomas Hughes, Joseph Caldwell, Daniel Zane.

*West Liberty.*—John J. Jacob.

*Trisdelphia.*—Col. Archibald Woods, Gen. Daniel Cruger, Henry Bell, Thomas Thoraburg, Lewis Lunsford, Jacob Gooding, Daniel Steenrod.

*St. Clairsville.*—James Caldwell, Wm. B. Hubbard, Daniel Peck, David Allen.

*Harrison County.*—John Anderson, Jas. McMillen.

*Bridgeport.*—E. Martin.

*Uniontown.*—Gen. A. Stewart, Wm. P. Wells, H. W. Beeson, George Mason, John Dawson, Richard Beeson, R. D. Henniken, J. B. Howell, John M. Austin.

*Washington County.*—Col. Thomas Ringford, John Oliver.

*Williamsport.*—Hon. T. H. Baird, Major S. Benly, John McFarland, William Impson, Isaac Van Voorhees, Jos. Hamilton, Jos. Alexander, Samuel Hill.

*Fredericktown.*—John Bowers.

*Millsborough.*—Daniel Shutterly, Isaac Colvin, Wm. Vankish, Isaac Holliman.

*Pittsburgh.*—Alex. Breckenridge, Thomas Blakewell, M. B. Meltenberger, L. P. Darlington, Lewis Peterson, Thomas Williams, Isaac E. Wade, James Patterson, jun.

*Brownsville and Bridgeport.*—Wm. Hogg, Jacob Bowman, Joshua Wood, Michael Sowers, Benedict Kimber, Robert Clark, George Dawson, David Biuns, Jos. Thornton, James L. Bowman, D. L. Blaine, Thos. Sloan, Cephas Gregg, Eli Forsythe, William Cock, David Porter, John Cock, Henry Sweitzer.

*West Brownsville.*—E. L. Blaine.

On motion of Mr. Sprigg, of Wheeling, a committee was appointed to select suitable persons as officers of the Convention; which was done. A committee was also appointed to report rules for the government of the Convention—after which an adjournment of the Convention until 4 P. M. was carried.

At the appointed time the Convention assembled, when the committee reported the following names, viz:

The Hon. ANDREW STEWART, of Pa., to be President.

Col. Thomas Ringland, of Pa.	} Vice
Col. Archibald Woods, of Va.	
John Gephart, of Maryland,	} Pres'ts.
James Caldwell, of Ohio,	
Jacob Albert, of Baltimore,	} Secretaries.
A. Breckenridge, of Pittsburgh,	
James L. Bowman, of Pa.	} Secretaries.
J. P. Kennedy, of Baltimore,	
Samuel H. Davis, of Virginia,	

After the adoption of several resolutions, and amongst others the following: That a committee, to consist of three persons from each State represented in this Convention, three from the city of Baltimore, three from the city of Pittsburgh, and three from the town of Wheeling, together with Gen. Andrew Stewart on behalf of the Chesapeake and Ohio Canal Company, and Mr. Wm. Stewart on behalf of the Baltimore and Ohio Railroad Company, be appointed and instructed to consider, arrange, and digest such measures, and report

such resolutions as they may think it expedient for this body to adopt, the Convention adjourned, to meet at 9 A. M. the next morning.

**RAILROAD FROM CHAMBERSBURGH, PA., TO WILLIAMSPORT, MD.**—The Williamsport Banner of Nov. 28, says:—"A numerous meeting assembled in Greencastle, Pa., yesterday, in pursuance of public notice, for the purpose of considering measures relating to the proposed Railroad from this place to Chambersburg.

The object of this meeting was to adopt measures to obtain a charter from the Legislature of Maryland for a Railroad from Williamsport on the Potomac to the Pennsylvania line—there to connect with a road already chartered by Pennsylvania to Chambersburg. There is also a Railroad called the Cumberland Valley Railroad—uniting Chambersburg with Harrisburg, which is about to be commenced.

Thus connecting the seat of Government of Pennsylvania with the Chesapeake and Ohio Canal on the South.

The following extracts from the proceedings of a meeting, held at Ogdensburg, on the 9th inst., and the annexed proceedings of the Railroad Convention, held at Malone, on the 12th, taken in connection with previous proceedings in Lebanon, New-Hampshire, show a determination amongst those residing on, and in the vicinity of, the line of the contemplated Railroad from Ogdensburg to Plattsburgh, in New-York, and from Burlington, Vt., through New-Hampshire, to Boston.

This Road will eventually be constructed—and it will afford great advantages to the section of country through which it will pass. It will also afford to the inhabitants of those states an easy, cheap, and expeditious mode of emigration to the West; so expeditious, indeed, and so easy, that many will avail themselves of it, who otherwise would not encounter the labor.

**RAILROAD MEETING.**—At a large and numerous meeting of the citizens of Ogdensburg, convened at Haskin's Hotel, on the 9th day of November, 1835, pursuant to previous notice, for the purpose of appointing Delegates to attend the Railroad Convention, to be held at Malone, on the 12th instant.

Silvester Gilbert was chosen Chairman, and Baron S. Doty, Secretary.

The object of the meeting having been stated by the chair, the following persons were appointed Delegates, viz. Silvester Gilbert, Preston King, Henry Van Rensselaer, Baron S. Doty, and John C. Bush.

The following, amongst other resolutions, were passed:

Resolved, That we have the fullest confidence in the ability of this work, to sustain itself, without looking to, or depending upon its extension to Boston.

Resolved, That the ultimate connection of the Western Lakes with the Atlantic Ocean, by a Railroad from the foot of Ship and Head of Boat Navigation, on the St. Lawrence, at Ogdensburg, with the city

of Boston, is a project worthy of the combined efforts of the several states and sections of country to be benefited by it.

Resolved, as the sense of this meeting, That the time has arrived, demanding the active exertions of our fellow citizens, resident along the route of the projected Railway, and that we will co-operate with them in promoting this great enterprise.

Resolved, That B. Perkins, A. C. Brown, E. Vilas, P. King, and G. N. Seymour, be a Corresponding Committee for the county of St. Lawrence.

S. GILBERT, Chairman.

B. S. Doty, Secretary.

In pursuance of previous notice, the Lake Champlain and St. Lawrence Railroad Convention, met at the house of O. T. Hosford, in Malone, on the 12th day of November, 1835, at 12 o'clock, M., for the purpose of taking into consideration the construction of a Railroad from the foot of sloop navigation on the River St. Lawrence to Lake Champlain.

After the ordinary preliminaries, the meeting was adjourned until 2 P. M., when the committee reported the names of the following gentlemen as officers of the Convention.

Hon. W. F. HAILE, of Clinton co.,	Pres't.
Hon. B. CLARK, of Franklin,	} V. Pres'ts.
S. GILBERT, Esq. of St. Law.,	
A. C. MOORE, Esq. of Clinton,	
S. RAYMOND, Esq. of St. Law.,	
P. KING, of St. Lawrence,	} Secretaries.
J. PARKHURST, of Franklin,	

Which Report was unanimously adopted, and the Convention duly organized.

Mr. Jackson, from the committee appointed for that purpose, then reported the following resolutions, which, after an able and eloquent discussion of the subjects embraced in them, by Messrs. Bradish, Haskell and Woodward, were severally and unanimously adopted.

Resolved, That the construction of a Railroad from the navigable waters of the Western Lakes to some point on Lake Champlain, is not only practicable, but is imperiously required, by a proper regard to the interests and prosperity of this State and country, and that it can no longer be delayed without an abandonment of the essential interests of at least the northern counties of the State of New-York.

Resolved, That an application be made to the Legislature of this State at its approaching session, to revive the act entitled "An act to incorporate the Lake Champlain and Ogdensburg Railroad Company," passed April 20th, 1832, and so to amend the same as to reduce the capital stock of said Company to six hundred thousand dollars, to appoint commissioners, and to require the books for the subscription of the stock of said Company, to be opened without delay.

Resolved, That the members of Assembly from the counties of Essex, Clinton, Franklin, and St. Lawrence, and the Senators from the fourth Senate District, be particularly requested to aid in carrying into effect the last preceding resolution.

Resolved, That Joseph H. Jackson, William Hagan, Asa Hascall, Jabez Parkhurst, and Amherst R. Williams, be a committee to prepare and forward to the Legislature of this State, in the name of this Convention, a memorial pursuant to the foregoing resolutions.

Resolved, That Smith Stilwell, John L.

Russell, Samuel Partridge, Silvester Gilbert, Preston King, and Horace Allen, of St. Lawrence county; James B. Spencer, Asa Hascall, Benjamin Clark, Clark Lawrence, and Luther Bradish, of Franklin county; William F. Haile, Silas Hubbell, Richard Keese, Amasa C. Moore, Gersham Cook, and James W. Wood, of Clinton county; and Elkanah Watson, Thomas A. Tomlinson, Oliver Keese, Charles M. Watson, and Henry H. Ross, of Essex county, be a General Corresponding Committee, whose duty it shall be, without delay, to open a correspondence on the subject of the proposed Railroad, with such gentlemen in other parts of this State, and in other States, as may be supposed to feel an interest in its construction, and to invite their concurrence and co-operation in the measures necessary for the prosecution and accomplishment of the work.

On motion of Mr. S. Gilbert, Resolved, That the Committee for preparing a memorial to the Legislature, cause the requisite legal notices to be published.

On motion of Mr. F. L. Harrison, Resolved, That the proceedings of this Convention be signed by the officers of the Convention, and published in all the newspapers printed in the counties of Essex, Clinton, Franklin and St. Lawrence, and in the Albany Argus.\*

On motion of Mr. Parkhurst, the Convention adjourned.

WILLIAM F. HAILE, President.  
BENJAMIN CLARK,  
SILVESTER GILBERT,  
A. C. MOORE, } V. Presidents.  
SEWALL RAYMOND,  
PRESTON KING, } Secretaries.  
JABEZ PARKHURST,

There can be little doubt, we imagine, of the success of an application to the Legislature for a renewal of the charter, or of the ultimate construction and prosperity of the road, as we have full confidence in the remark of Mr. Vignoles, that "Railways create their own sources of revenue."

\* The Railroad Journal appears not to have been known to the members of the Convention—we will endeavor to have it make their acquaintance.

### CANAL INTELLIGENCE.

**SANDY AND BEAVER CANAL.**—We have long deferred the report of the Directors of this Company, which was made last August to the stockholders—and of which we are now reminded by the report of the Chief Engineer, E. H. GILL, Esq.

This Canal is to extend from the Ohio Canal at Bolivar, to the mouth of the Big Beaver Creek on the Ohio River, and is about 90 miles in length.

The first charter for this Canal was granted, we believe, in January, 1829, by the Ohio Legislature, but in consequence of a variety of circumstances, its commencement was delayed until late in the fall of 1854, when 2½ miles were put under contract. Since that period the work has been prosecuted with spirit and success, as we learn from the Engineer's report, which we shall endeavor to give entire in our next.

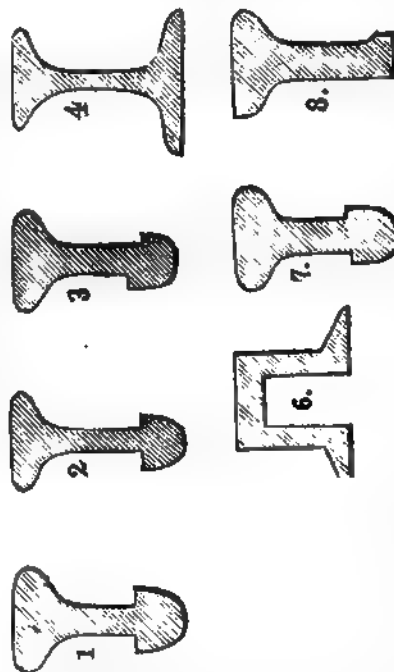

In the mean time, however, we give the following extract, which shows the present condition of the work.

On the eastern division of the line 49 sections or 24½ miles of canal, 15 dams and 46 locks are now under contract, on the middle division, 21 sections or 11 miles including the tunnels and the reservoir mounds on the west fork of Little Beaver Creek and Cold Run. And on the western division 28 sections or 14 miles 11 locks, 1 dam and the aqueduct over the Tuscarawas River, constituting in all 49½ miles of Canal, 14 dams, 57 locks, one aqueduct and two Reservoir mounds now under contract.

The work has been prosecuted in most cases with energy, and is now in a greater state of forwardness than could reasonably have been anticipated, considering that the season was far advanced when it was commenced. About 34 sections or 17 miles of canal are now completed, and likewise the mason work of two locks and 144,000 cubic yards of excavation removed from the summit deep cuts, dam No. 2 on the western division will probably be completed next week. The foundation of five other locks and two dams are laid, and 1500 perches of wall built, and a large quantity of stones, and other materials for the construction of locks and dams are prepared, and on the ground, and I have no doubt, all the work now under contract excepting the tunnels and aqueduct will be finished in the approaching year.

The work placed under contract is in most instances in the hands of responsible and efficient men, and has been taken on terms exceedingly favorable to the company.

There is at the present period on the line a force equivalent to 2100 men; the costs of the locks which are built in the most durable manner of cut sand stone will not exceed \$700 per foot lift, being about thirty per cent. below the ordinary cost elsewhere; the cost of the dams, which are in most instances 14 feet high, will average about 28 dollars per foot linear across the stream, and the canal, exclusive of locks and dams, generally from \$3000 to \$5000 per mile.

(From the Journal of the Franklin Institute.)  
**Sections of Rails used in the United States.**  
By J. C. TRAUTWINE, Civil Engineer.  
Gentlemen,—I send for insertion in the Journal of the Institute, transverse sections

of eight varieties of parallel rails, employed on different Railroads in the United States. The figures are drawn to a scale of one fourth the full size, and accompanied by a statement of the weights, per lineal yard.

No.		Weights.
1.	Columbia and Philadelphia, per yard, 41½ lbs.	
2.	" " " "	33 "
3.	Germanstown and Norristown, " "	39 "
4.	Camden and Amboy, " "	39½ "
5.	Boston and Providence, " "	54 "
6.	Wilmington and Susquehanna, " "	40 "
7.	Allegheny and Portage, " "	40 "
8.	Boston and Providence, " "	40 "

(From the same.)

### On Steep Grades for Railroads. By A. C. JONES.

Gentlemen:—In reading the reports of new Railroads that are being located, I have been surprised to see that Engineers propose grades of one hundred feet to the mile, and state that locomotive engines will overcome them with ease;\* this being only the case when the greater part of their load has been left behind, or when the assistance of another engine is afforded to aid the first one up the grade.

Inclined planes, with stationary engines, are serious evils on Railroads, and where the plane is such that it requires the power of another locomotive to surmount it, the evil is only lessened: far better would it be for the stockholders, if the Engineer should lengthen the road five miles, than to make a grade over thirty feet to the mile. Where the carrying trade is all one way, there is an exception to this remark, but then such grades are not consistent with safety.

It will be admitted by all, that the state of the water in the boiler of a locomotive engine is of considerable importance, and any person who has seen locomotive engines, with boilers of Mr. Stephenson's plan, will not have failed to notice the great change in the height of the water in the boiler, in passing from a level down a grade of twenty-five feet to the mile. This is easily accounted for, by the angle which the grade makes with the horizon, and as the water in the boiler will find its level, it flows to the lowest end: moreover the centre of gravity being thus moved forward, increases the weight on the springs in front, which are straightened in proportion, while part of the weight being removed from the hind part of the carriage, the elasticity of the springs will raise it up, and the cap of the fire box, and part of the flues, are liable to be left dry.

It may be urged by some, that the ebullition in the boiler will keep the flues wet; but as it is known, that in descending a grade exceeding one hundred feet, no steam will be required, and there being consequently no draught, the water will not be in violent ebullition.

Respectfully yours,  
A. C. JONES.

Portsmouth, Va., Aug. 20th, 1835.

\* I have not seen the official account of the experiment of ascending the one hundred and seventy-six feet grade, on the Baltimore and Ohio Railroad; but it is not prudent to take a single experiment as a basis by which to form grades.

**NEW JERSEY RAILROAD.**—We are highly gratified at the industry and enterprise manifested along the line of this great improvement. The entire line of the road from Jersey City to this city is in a great state of forwardness and nearly graded. The rails are being laid on the road, and the contractors are now busily engaged within three miles of the Raritan, which, we think, is a sure guarantee that during the coming winter the road to this city will be completed.—[Frederician.]

## AMERICAN RAILROAD JOURNAL.

NEW-YORK, DECEMBER 12, 1835.

**TO RAILROAD CONTRACTORS.**—By the annexed notice it will be seen that another Railroad is progressing in the Southwest—a part of the country in which Railroads are to be more used and more useful—if possible than in any other—and we would direct the attention of our readers, whose interest may be thereby promoted, to the following notice of the President :

PROPOSALS will be received at the Office of the West FLEICIANA RAILROAD COMPANY, in the town of Woodville, (Mississippi,) until the 15th day of January next, (1836,) for grading, bridging and constructing the Railroad for said Company, or any number of Sections thereof, yet unfinished. This road extends from the Mississippi River, near St. Francisville, to the town of Woodville, about 27½ miles, passing over lands composed of light soil and clay, free from rock of any kind, and it is believed, holds out uncommon inducements to Contractors.

It is desirable that all the work in each Section, including grading, bridging and superstructure, should be embraced in the same contract, (the Company finding timber and iron;) it is requested that the proposals be made in conformity thereto.

As it is expected that periodical payments will be required, as the work progresses, it is therefore requested that the proposals state particularly the price for grading per cubic yard, bridging per foot, and the superstructure per mile,—and the time the same will be commenced and completed.—The superintending Engineer will be on the ground to give the necessary information.

The usual evidence of character, capacity, and responsibility, will be required.]

JOSEPH JOHNSON, Pres. W. F. R. R. C.

Woodville, November 12th, 1835.

49—2

## INTERNAL IMPROVEMENT CONVENTION.—

It may perhaps be inferred, from the long delay in publishing the proceedings of the Convention, held at Utica, on the 11th of November, that we take very little interest in its objects and proceedings, as well as of that which is to be held at Albany on the 11th day of January next. Such inference, however, would be very wide of the truth, as many who know us, can bear witness. It may be proper, however, for us to say, that the delay has been entirely accidental, as well, we presume, in the omission, by those who prepared that report for publication, to furnish a copy for the Journal, as it has been in us, in not selecting it before from those papers in which it was published. They are now given, together with a circular, addressed by the Committee, to many gentlemen in different parts of the State, with a view of insuring a general attendance at Albany, of delegates from all parts of the State, that there may be an interchange of opinion, and a comparison of views, in relation to the adoption of measures that shall give renewed impulse, in this State, to the spirit of improvement which will carry out, to its full extent, the great system of Internal Improvement so happily, and so successfully, commenced in 1817.

It is important to a proper appreciation of what is now in contemplation, courses of construction, and in successful operation, in other States, that we should assemble, in Convention, from all parts of the State, and communicate to each other the result of our inquiry and investigations, that the people at large may be apprised of the efforts now making to divert from their works, the immense trade of the West; and with a view of devising measures by which the numerous avenues in this State, yet unimproved, may be brought into use, that we may, at least, have a clear field, and fair competition with our neighbors, for the prize, whose value is, to this city, beyond computation.

It is much to be hoped that gentlemen of

enlightened minds and liberal views will be selected to attend the Convention; and that they will, when there, act in such a manner as will tend to the greatest benefit of the greatest number, by advocating such works as will, when completed, insure the construction of numerous others, and they in their turn of others, until the State shall be intersected, in all directions, by easy modes, and as direct as possible, of reaching market. It is not to be supposed, that gentlemen will not look with some interest to those works which will promote the prosperity either of themselves or their friends; yet it is the duty of every man, and it will, no doubt, so be manifested by the Convention, to merge small, local, or sectional matters, in those of greater magnitude, and thereby insure, at an early day, the accomplishment, by force of public opinion, of those secondary works, which will then be not only of great convenience to community, but also of profit to those who embark in them; whereas, if undertaken previous to the construction of the great thoroughfares, they would be comparatively valueless.

Were it not that we might be thought desirous to lead in the matter, or to direct public opinion, we might give our views as to some of the most important works which should engage the deliberations of the Convention; but as we may be thus viewed by those who are unacquainted with us, we will not venture further upon this point than barely to allude to a few of those great routes, which cannot escape the most casual observer—who gives the subject a thought—leaving the others for the consideration of those more interested, and better qualified to show their importance.

Among other important matters, they will doubtless consider the necessity of so enlarging the Erie Canal, and of connecting it with Lake Ontario, and that lake to Erie, by a Canal around the Falls of Niagara, as to insure the business, which naturally, and always, will follow that channel, an easy and

unobstructed passage to tide water. In relation to that subject, the present is an important moment, for the exercise of the best judgment, and most enlightened forecast of every intelligent man. It is of vast importance that whatever may be undertaken, shall be so accomplished, as to render all further enlargement unnecessary—and that such will be the result, we entertain very little doubt.

The Olean Canal is also a work which will doubtless receive that attention to which its importance entitles it. It is a work which will ultimately afford to this city a large amount of valuable timber; and enable many, who now realize but small profits from their lands, to share with the inhabitants of the more favored sections of the State, in the rich returns which an improved navigation to market enables them to derive. These are of immense importance to the people during a part, say about seven months of the year—and they will therefore be properly considered.

It is, however, in this age of *improved locomotion*, a subject of the first importance, as well to the whole country, as to this city, that other modes of communication should be adopted between this great commercial emporium, and the vast country which contributes to its prosperity; that there may be a constant, easy, cheap, expeditious and *unobstructed* intercourse, not only for travel, but also for transportation, AT ALL SEASONS OF THE YEAR.

Such has been the march of improvement, and such the increase of facilities for doing business, within the last ten years, that nothing short of the *whole year* will now satisfy us for the transaction of business; it, therefore, becomes our imperative duty to urge forward those great works that have been projected, which, when completed, will not only annihilate time and space, but also *winter and ice*, so far as they have heretofore tended to obstruct the regular course of business between this city and Albany, and the western part of the State.

The charter granted in 1832 for a Railroad from this city to Albany, on the east side of the Hudson, will, beyond all question, be renewed during the ensuing winter by our Legislature; and the Road *must* now, of course, be constructed, by way of self-defence, in consequence of the determination of the people of Boston to remove up to Albany—or rather to remove Albany, and a good portion of our western business, to Boston—by the Railroad between these two cities.

We say, New-York *must* construct this Railroad, on the east side of the Hudson, in *self-defence*; and while our hand is in, and by way of retaliation, we will run close alongside of the land of "Blue Laws," and the "Old Bay State," and occasionally board them, in search of such productions of their soil, as will contribute to "our

own convenience, and the convenience of others;" and then Boston may, if she please, take New-York *also*, with Albany and the Western Canal trade, if she can—or, in sober earnest, the citizens of New-York will not permit Boston to become the seaport of the line of our Canals, during four months of the year, for want of a means of reaching our own better market. Should they do so, by inattention to their best interests, and by an omission to open this channel of communication, then will Boston not only become the seaport of this State, and of the West, for one-third of the year, but she will be richly entitled to the prize she will thus have gained. This road must, and will be constructed; and in order to give as wide a scope as possible for business, inasmuch as it must, for 7 or 8 months of the year, run an express against the *Hudson River*, it will probably take an inland route; and perhaps in some places even touch upon Connecticut and Massachusetts, and probably connect at Stockbridge with the main Boston line, thereby making a part of the route a common track, which must, of course, make it uncommonly productive stock.

In addition to this Road, which will, during the winter, receive all the travel and transportation, and in summer, at least a share of the travel from the north and west of Albany, destined for New-York; we must refer to another of still greater importance, and which has the advantage of the first, in the circumstance of its being already commenced—the New-York and Erie Road. This Road will not only become a great thoroughfare for all kinds of business for, and from, the far west, but it will become the grand *track* for a numerous family of lateral roads, which will connect it with the Canal and the country beyond it—thus opening to almost the whole State, an easy and expeditious mode of getting to and from market, at all times and seasons of the year.

The most important of these branch Roads, are the Bettsburgh and Utica Road, which will probably eventually be continued on from Utica to St. Lawrence county—the Binghamton, Courtland and Syracuse Road, which will be continued to Watertown, in Jefferson county—thereby opening an easy channel for the distribution of the immense salt works at Salina and Syracuse, and of supplying that region with the coal and iron of Pennsylvania. In relation to this Road, the people are now just beginning to move, as will be seen from a Circular, in this number of the Journal. Of much of this route we can speak from personal observation, and we hesitate not to say, that a more feasible one, of equal extent, cannot be found in the country; and very few, indeed, which will afford the same amount of permanent business, aside from the products from the cultivation of the soil. With the salt works at one end,

Salina, and the coal and iron of Pennsylvania on the other, both inexhaustible in their supply, and each wanted along the whole line, it cannot but become, if properly constructed, one of the most profitable, as well as convenient, works of the kind in the country.

To this work we would ask the attention of all, as taken in connection with the main track, or by itself, it becomes a work of much interest and importance; and should not, therefore, be passed lightly over.

The next in order is the Owego and Ithaca, which will eventually be continued, not only to Geneva, but also to Auburn, connecting at each of those places with one, which will, at an early day, extend from Albany to Buffalo. Another branch will be made from Steuben, or Alleghany county, to Rochester, and another from some point still farther west to Buffalo, thus intersecting the whole State, at short intervals, and thereby removing almost *every farm in the State* to within from one to three days travel of this city; and at the same time secure to the city of New-York the business of the west, and to the people of New-York the profits of its transportation; and what is of far more importance, the reputation of being not only first in population, but also first in Internal Improvements, and in Agriculture.

With these important facts before the people, we have not a doubt but that a Convention will assemble at Albany which will do credit to the State; nor that it will, when assembled, take an enlarged and liberal view of the subject on which it came together; and therefore great good must result from the intercourse of so many intelligent men, engaged in the same cause.

NEW-YORK, 30th Nov., 1835.

Sir,—By the direction of the "Internal Improvement Convention of the State of New-York," lately assembled at Utica, the undersigned request your patriotic attention to the subjoined proceedings of the Convention.

It is certain that many lines of intercommunication, in this great State, remain unimproved, to the manifest inconvenience and loss, of large masses of our citizens, while the vast works, completed and in progress, in neighboring States, enable their inhabitants to reap the advantages to be derived from an extended inland commerce.

The season of frost, which is now closing and rendering useless, for nearly half the year, the only great work of this State, may be deemed a suitable occasion to invite our fellow citizens seriously to reflect upon what should be done, to improve our condition, and to enable us to compete with our sister States. Your personal exertions are solicited, to induce the citizens of your County to assemble, without delay, and to appoint delegates to the Adjourned Convention, to be held

at Albany, on Monday, the 11th of January, 1836.

We are, respectfully, your fellow citizens, and obedient servants.

J. G. SWIFT, 2d Vice President.

DAVID C. COLDEN, Secretary.

INTERNAL IMPROVEMENT CONVENTION OF THE STATE OF NEW-YORK.

The Delegates to this Convention assembled at the Court Room, in the city of Utica, on Wednesday the 11th inst., agreeably to the published call for the Convention, by the Circular of the Chairman of the American Institute. For the purpose of a temporary organization, Gen. JOSEPH KIRKLAND, of Utica, was called to the Chair, and HENRY LOUCKS, Esq., of Montgomery, appointed Secretary. The following Delegates presented their credentials of appointment, and took their seats in Convention:

*Long Island*.—Edward Copeland, J. G. Swift, H. E. Pierpont, Morris Van Buren, George Hall.

*City and County of New-York*.—Henry Yates, James B. Murray, H. H. Elliott, John R. Peters, Joseph Blunt, D. C. Coken, Philip Kearney, Joseph E. Bloomfield, Curtis Bolton.

*On behalf of the American Institute, New-York*.—George Sullivan, Thaddeus B. Wakeman.

*Canajoharie and Catskill Railroad Company*.—Thos. B. Cook.

*Montgomery*.—Andrew B. Calhoun, Gerit L. Roof, Henry Loucks.

*Herkimer*.—Dr. Doolittle, Charles Grey.

*Utica, Oneida county*.—Joseph Kirkland, Theodore S. Gould, Thomas Walker, Hiram Denio, T. S. Faxon, Samuel Farwell, Chester Griswold, Willard Crafts, Thomas Goodsell, Samuel Beardsley, Rutger B. Miller, Joshua A. Spencer.

*On behalf of the Mechanics' Institute, Utica*.—Gardiner Tracy, Thomas Colling, Robert M'Bride, John Parsons, Jacob D. Edwards, Samuel P. Lyman.

*Clinton, Oneida county*.—A. S. Ruddock, Henry G. Everett, Samuel Comstock.

*Whitesboro, Oneida county*.—S. Newton Dexter, William S. Wetmore, Ichabod C. Baker, George Balis.

*Rome, Oneida county*.—Henry A. Foster, Benjamin P. Johnson, Joseph Stringham, Calvin B. Gay.

*Vernon, Oneida county*.—Luke Hitchcock.

*Oswego*.—T. S. Morgan, G. F. Falley.

*Lewis county*.—Daniel F. Buck, Sylvester Miller.

A resolution was then adopted that a committee of twelve persons should be appointed by the Chair, to report the names of officers to preside over the deliberations of the Convention. The following persons were appointed by the Chair, agreeably to this resolution:—Messrs. Yates, Wakeman, Blunt, Swift, Tracy, Falley, Buck, Loucks, Cook, Walker, Baker, and Foster.

The Convention then adjourned to meet at the Common Council Room, at 7 o'clock.

7 o'clock, P. M.

The Convention assembled pursuant to adjournment. The committee to report

the names of presiding officers, reported as follows:

For President, Hon. SAMUEL BEARDSLEY, of Oneida.

For 1st Vice President, SYLVESTER MILLER, of Lewis. For 2d Vice President, Gen. J. G. SWIFT, of Kings.

For Secretaries—DAVID C. COLDEN, of New-York, and THEODORE S. GOLD, of Oneida.

On motion of Mr. Copeland, the Report of the Committee was adopted, and the officers named by the Committee took their respective seats.

The following Resolutions were then submitted, and severally adopted by the Convention.

Resolved, That in view of the great and growing interests of this State, and the certain prospect of a continued and rapid increase of its wealth and its commerce, it is incumbent upon the citizens thereof, to unite in adopting such measures as may be calculated to promote Internal Improvements, upon a scale corresponding with our resources, and with the laudable enterprise of the people.

Resolved, That the several counties which have not sent Delegates, be requested to send Delegates to this Convention, at an adjourned meeting: the counties to send three times the number of their representatives in the Assembly, respectively.

Resolved, That when this Convention adjourn, it shall adjourn to the 2d Monday of January next, to meet at the Capitol in the city of Albany.

Resolved, That a Committee, consisting of three members from each Senatorial District, be appointed to facilitate the assembling of said Convention, and that they also be desired to submit a plan for a permanent organization, together with such other matter as they may deem expedient for the action of said Convention.

Resolved, That the said Committee be appointed by the officers of this Convention.

Resolved, That the officers of the Convention be requested to take the necessary steps to procure a full and general representation to the contemplated Adjourned Convention, and that they be authorized to fill all vacancies which may occur in any Senatorial Committee.

Resolved, That a committee of seven be appointed to collect information as to the annual cost of the post and county roads, in this State, and to report, at the next meeting of this Convention, a system for permanently improving their condition.

The following gentlemen were appointed: Messrs. Blunt, Lee, Swift, Pierpont, Cook, Schermerhorn and Lyman.

Resolved, That when this Convention adjourn, this evening, it adjourn to meet at 10 o'clock, to-morrow morning.

Resolved, That a Committee of ten be appointed by the chair to report to this Convention, at its meeting to-morrow morning, subjects for its consideration.

The following gentlemen were named by the Chair, as members of the above committee:

Messrs. Bloomfield, Foster, Swift, Murray, Spencer, Elliott, Loucks, Falley, Buck and Grey.

Communications were received from Ro-

chester, and from the Hon. Gideon Lee, which were severally read and laid on the table.

Convention adjourned to meet to-morrow morning at 10 o'clock.

Before the Convention adjourned, the President rose, and stated that he must, in discharge of his official duty as member of Congress, be absent at the contemplated adjourned meeting of the Convention, nor could he perform the duties devolving on the officers of the meeting, by one of the resolutions adopted; he must, therefore, request the Convention to select another presiding officer in his stead.

Nov. 12—10 o'clock, A. M.

The Convention re-assembled according to adjournment, at 10 o'clock. After the organization had taken place, the President repeated the suggestions made by him last evening, and proffered his resignation.

It was Resolved, That the resignation of the President be accepted, and that the first Vice President, Dr. Sylvester Miller, be requested to preside.

Joseph E. Bloomfield, in behalf of the committee of ten, appointed at the previous sitting of the Convention, then made their unanimous

REPORT.

Whereas, the growing interests of this State require the timely provision of means to give efficient aid to the development of the resources of our vast interior—And whereas, it is important that information on the subject, be collected and disseminated among the people of this State—And whereas, it is believed that we have among us public spirited citizens, willing to devote an adequate portion of their time to promote plans which would be calculated more rapidly and effectually to realize the vast resources which are yet but partially brought into action; therefore,

Resolved, That it is recommended to form a *State Society for the promotion of Internal improvements*, and that this Convention, at its adjourned meeting, adopt means to organize the same; the duty of which society shall be, to collect and diffuse such information as may be deemed of public utility. The society shall consist of a member from each county in this State, who shall appoint such officers and agents, and adopt such by-laws and regulations as they may deem necessary.

Resolved, That to enable the society to execute its functions, each county in this State be requested to form therein a *County Society of Improvement*, which society shall, at its stated meetings, propose plans of public utility to the State Society, and shall raise such sums by subscription, as the friends of Internal Improvements may find it proper to subscribe, to defray every expense incidental to carry into effect the operations of the State Society; and to remit the amount of such funds to the Treasurer thereof.

Resolved, That the State Society petition Congress to appropriate means to improve the Atlantic and Lake frontiers of this State, for naval and commercial purposes.

Resolved, That it is earnestly recommended to the people of this State, to take early measures for the construction of a

Ship Canal around the Falls of Niagara, by an application to the State Legislature, or Congress.

Resolved, That the members of Congress from this State, be requested to urge upon the consideration of that body the propriety of allowing foreign goods to be transported across the territory of the United States, under proper regulations, to the provinces of the Canadas.

Resolved, That in carrying out the views of this Convention, all local and sectional jealousies should be deprecated, and that the people of this State owe it to themselves to direct their combined energies to the speedy completion of all the great works of Internal Improvement, tending to facilitate the intercourse between the different sections of this State with each other and with the other States.

It was then Resolved, That the report be laid on the table for the consideration of the Convention at their adjourned meeting, and the committee be discharged.

It was then Resolved, That this Convention do adopt the fifth resolution reported by the committee.

The following resolution was then presented, by Mr. Copeland, and laid upon the table: "That it be very respectfully recommended to the Legislature to cause a topographical, and, if of sufficient importance, a geological survey of the State, or as much of it as may not already have been surveyed, for the purpose of having before them such information of a definite character, as will enable them to form a just estimate of the wants of every section of the State."

Resolved, That the thanks of this Convention be presented to the Authorities of the city of Utica for their attention in procuring a room for the use of the Convention during its present sitting.

The Vice President, in conformity with a resolution of the Convention, then announced the following gentlemen as committees in their respective Senatorial Districts:

1st District—Stephen Allen, Charles Henry Hall, John A. King.

2d District—George D. Wickham of Orange, Allen McDonald of Westchester, and Albro Aikin of Dutchess.

3d District—Samuel Cheever of Albany, Richard P. Hart of Rensselaer, and Alonzo C. Paige of Schenectady.

4th District—Edwin Dodge of St. Lawrence, Luther Bradish of Franklin, Richard Keese, of Clinton.

5th District—Hiram Denio of Oneida, Isaac W. Bostwick of Lewis, and Alvin Bronson of Oswego.

6th District—John H. Prentiss of Otsego, Chas. Pumpelly of Broome, and I. S. Beebe of Tompkins.

7th District—John Wilkinson of Onondaga, Azariah Smith of Onondaga, and Gerard Wilson of Ontario.

8th District—Elisha B. Strong of Monroe, Jas. Stryker of Erie, and Benjamin Chamberlain of Cattaraugus.

Resolved, That the thanks of the Convention be presented to the officers of the meeting.

Resolved, That the proceedings of this

Convention be published, and that the officers, including the late President, be requested to subscribe their names thereto.

The Convention then adjourned.

SAMUEL BEARDSLEY, Pres't.

SYLVESTER MILLER, } V. Pres'dts.  
J. G. SWIFT, }

DAVID C. COLDEN, } Secretaries.  
THEODORE S. GOLD, }

In connection with the proceedings of the Convention published above, we give the letters below—one of them written by the Hon. Gideon Lee, now member of Congress elect from New York, and the other by Mr. Schermerhorn of Rochester, in behalf of the delegation from that city.

New-York, Nov. 7, 1835.

Henry Yates, Esq. Chairman.

My Dear Sir:—I am gratified with the proposed measure of a State Convention at Utica, relative to the prospective internal improvements of our great and growing State. I think the measure will elicit and concentrate a mass of information on this important subject, calculated to produce greater uniformity of sentiment and greater unity of action than has been, and, I trust, will result in the adoption of some general practical system, promotive of this great paramount public interest.

I regret that recent engagements, added to old ones, put it out of my power to attend personally. Your obed't serv't,

GIDEON LEE.

Rochester, 9th Nov. 1835.

To the Chairman of the Convention to be held at Utica on the subject of Internal Improvement, 11th Nov., 1835.

Dear Sir:—At a public meeting held in this city, pursuant to notice, five delegates were elected to meet with you at Utica: unforeseen circumstances prevent a majority from attending; we therefore shall not be represented. We cordially approve of the call for a Convention, and shall be happy to co-operate with you in any measure to advance the interests of our State.

We are deeply sensible of the importance of constructing and improving canals, rail and common roads, for the convenience and benefit of the State generally.

Respectfully, your ob't serv'ts.

J. M. SCHERMERHORN,  
For the Committee.

BALTIMORE AND OHIO RAILROAD REPORT.—We commence in this number, the sixth annual report of JONATHAN KNIGHT, Chief Engineer of this Road. The first part, or rather first report, for there are two, relates to the Road and affairs generally of the Company. The other part, or second report, refers particularly to the examinations and surveys of routes for the Road from Cumberland to the Ohio River, at Pittsburgh and Wheeling. We shall give this report entire, notwithstanding its great length, that our readers may see and duly appreciate the obstacles to be overcome in crossing the Alleghanies, and the enterprize and energy of our neighbors of Baltimore which grapples with them, and which, we

doubt not, will successfully overcome—as well as to place within their reach much useful and valuable information; by which all interested in such works may be stimulated to renewed efforts in the outset, as well as profit by the information in their operations.

Sixth Annual Report of the Chief Engineer of the Baltimore and Ohio Railroad.

ENGINEER'S OFFICE, BALTIMORE }  
AND OHIO RAILROAD, }  
Baltimore, October 5, 1835.

To PHILIP E. THOMAS, [

Pres't Baltimore and Ohio Railroad Co.

The time for making the annual statements relating to the affairs of the Railroads in charge of this Company, having arrived, I have now the honor to present my sixth annual report.

It was stated, in my report of last year, as probable, that a single track of railway upon the Washington Branch Railroad, would be opened and travelled from Baltimore to the line of the district of Columbia, by the first of July then next; and it is with unfeigned satisfaction, that I am now enabled to state that the result is in accordance with the belief then entertained: For on the first day of July last, a locomotive engine, with a train of cars containing the President, Directors, and other persons, went and returned over the entire space mentioned.

Within the present year, the Company, availing itself of the legislation of the general government, and of the most friendly and enlightened grants of the municipality of the city of Washington, has pushed forward the work with unfaltering energy, having completed the graduation and masonry, and the laying down of the first track of Railway for a distance of about three miles within the District of Columbia to the boundary of the corporate limits of Washington, and likewise for an additional distance of about 1½ miles within those limits to Pennsylvania Avenue, in that city; so that the entire line was opened for travel on the 25th day of August last, on which day the President and Directors opened the Road with appropriate ceremonies; four of the locomotives, with their respective trains, having, on this interesting occasion, passed from Baltimore to Washington and returned during the day, conveying nearly one thousand persons—the speed being about twenty miles an hour.

In the very short time of a few months, say in less than two years, the formation of this Road, involving the building of upwards of 46,000 perches of masonry, and the excavation and removal of nearly 2,000,000 cubic yards of earth, have been effected, and in the same period, a single track of Railway upon the entire distance (30½ miles), and 5 miles of the second track in the principal excavations, have been laid. I congratulate the Board upon so speedy a completion of the work to the extent described, and at a cost which puts it beyond doubt that when the second track shall be completed, the total amount of expenditure upon the construction of this Railroad will fall short of the lowest estimate made by me, and which was reported on the 27th July, 1833. Sec. 7th, Annual Report of President and Directors, page 59.

Since the opening of the Branch Road, as above mentioned, two locomotive engines have been employed upon it in the convey-

ance of passengers, each making one circular trip, daily, and no trip has been lost, or even delayed, beyond a few minutes.

The time consumed in making a trip with the engine, is usually from 2 hours 10 to 2 hours 30 minutes; although sometimes the journey has been made in 2 hours. The average time, however, has been about 2 hours 15 minutes, with a running velocity of about 20 miles an hour, but inclusive of the time spent at the water stations, the average speed is about 16 2-3 miles per hour. This is quite a high velocity, considering the rawness of the embankments and the consequently liability to derangement in the Road, as with the utmost care, unequal settlements of the rails will occur, and may have an evil effect before a readjustment can take place: And this may happen on many parts of the line at the same time, especially on occasions of heavy rains. These reflections would seem to suggest the propriety of a lower rate of speed, until the subsidence of the embankments had rendered the road more permanent, after which the journey might be made in 2 hours—meantime 15 miles an hour would be more safe, and at this speed the time would be 2 hours 30 minutes.

It was stated, in my last annual report, that the graduation and masonry upon the sixth division of the Baltimore and Ohio Railroad, were then completed, and that in the course of that season, a single track of railway would probably be laid down the entire length of this division, extending up the Potomac, and along the margin of the Chesapeake and Ohio Canal, from the Point of Rocks to the bridge at Harper's Ferry. This expectation was duly fulfilled, and the Road was opened for travel on the 1st day of December last, from which time the trade and travel have continued to pass upon the Railroad between this city and the point to which the Road is finished opposite to Harper's Ferry, without any serious interruption.

The plan of a viaduct to be erected across the Chesapeake and Ohio Canal and the Potomac River at Harper's Ferry, has been designed chiefly by my late assistant, B. H. Latrobe. The mason work of this structure which is (besides other uses) to form a connection between the Baltimore and Ohio and the Winchester and Potomac Railroads, has already been contracted for, and it is intended likewise to contract for the superstructure, which is to be of wood, as soon as practicable; in order that the entire viaduct may be finished in the shortest time possible.

For the details relating to the construction upon both Railroads, I refer to the report of Casper W. Wever, superintendent of graduation, masonry and construction.

The surveys and drawings connected with them having been generally completed to Harper's Ferry and to Washington, the services of several of my assistants have been dispensed with; of this number are Benjamin H. Latrobe, who is now Chief Engineer upon the Baltimore and Port Deposit Railroad, and Henry R. Hazlehurst, and James Murray, who are likewise upon that Road as his assistants.

In the department of machinery the constructions have advanced successfully as regards cars and coaches, as well as locomotive engines, in all of which, I am happy to say, our efforts have been crowned with the most brilliant success. For the details in this department of the service, I refer to the Superintendent of machinery.

With regard to the locomotive engine, we have to remark that no changes in the

principle of its construction, have been introduced and adopted since last year. The working of these American engines proved so satisfactory that it was thought more advisable, inasmuch as the branch to Washington was to be travelled exclusively by the power of steam, to construct, without delay, a sufficient number of them to insure a successful commencement and continuance of the transit between Baltimore and the capital of the Union, than by attempting to improve so costly a machine, that already worked so well, and by that means risking the chance of a failure in the requisite supply of locomotive engines. Some slight modifications, however, have been usefully made, whilst others, of the decided value of which, time only can test, are in the course of experiment.

In the report of last year, it is stated that the diameter of the working cylinders of the "Arabian" engine were each 12 inches, and the stroke 22 inches. All the engines since made, however, whilst the same length of stroke is preserved, have the diameter of their cylinders increased to 12 1/4 inches: and this was justified by the competency of the boiler to generate steam enough to work the enlarged cylinders with effect.

It was likewise mentioned in my last Annual Report, that the waste steam, in passing from the cylinders to the fan-wheel was transmitted in a hollow belt, encircling the boiler, in which belt the water pipes leading from the supply pumps were inclosed, in order that the water in its passage to the boiler might receive heat from the waste steam. In relation to this mode of saving fuel, or increasing the supply of steam, we have now to say, that in consequence of being attended with two evils, the plan failed to realize the benefits expected from it. In the first place, the reaction of the water immediately before the closing of the valve caused a sudden and powerful strain, upon the long and slender pipe, in which that fluid was enclosed, by which means the failure of the pipe at the joints, or in some other place, would often take place: and when this happened the pipe was not easy of repair, by reason of the difficulty of access to it. In the second place the transmission to the water of the caloric of the steam, so far condensed the latter as to render its elasticity unequal to the production of the requisite blast, by means of the fan-wheel. The plan of the belt and its inclosed pipes was therefore abandoned, whilst the steam was conducted in a different manner, and more directly from the cylinders to the fan-wheel: at the same time the engine continued to work remarkably well, although, as was supposed, with less economy than if the heat of the waste steam were imparted to the water, previously to the injection of the latter into the boiler.

To effect the accomplishment of this purpose it was proposed by Ross Winans, assistant engineer of machinery, to cause the waste steam, after it should have operated upon the blowing apparatus, to pass through 100 copper tubes, each half an inch in diameter and 15 inches in length, contained and fixed within a cylinder 14 inches in diameter and 15 inches in length; which cylinder is attached to the exterior of the boiler, and with the fixtures of the fan-wheel, presents a uniform finish. The water on its way from the force pumps to the boiler is impelled into and through the cylinder amongst the copper tubes, through which the steam is discharged, as above mentioned, by which expedient the boiler would be supplied with water already charged with a considerable degree of heat,

The apparatus for heating the water before it is thrown into the boiler, as last described, has been made and attached to one of the engines of the latest construction; but there has not yet been time to measure the utility of the contrivance by the test of experience.

Subsequently to the construction of the "Arabian" engine described in the last report, weighing 7 1/2 tons, an increase of weight to the extent of about one ton appears to have been introduced, so that the engines of the most recent construction weigh about 8 1/2 tons. The augmentation in weight has accrued from an increase of metal in the wheels, and in several other parts, being introduced in order to secure greater permanency and durability in the machine.

The opinion was expressed in my last Annual Report that an engine of 6 1/2 tons would have sufficient adhesiveness for the conveyance of passengers upon the branch road to Washington; and if an engine of this weight could be made of sufficient strength and durability of parts, and having at the same time a capacity to supply steam enough to maintain the desired speed; such should be the class of engines to be employed upon that road. The immediate necessity, however, for fabricating a number of engines sufficient to effect the business that would be required, has prevented an effort to produce a locomotive engine of the desired weight: at the same time we have sanguine hopes that success will attend our labors, in this respect also, whenever the effort can be considerably made.

In relation to the power of the Arabian engine the result of an experiment was given in the Report above mentioned, by which it appeared that this engine, the adhesions of both pairs of wheels being employed, drew after it, exclusive of the tender, upon a level part of the Baltimore and Ohio Railroad 112 tons 18 cwt. 1 qr. gross at a speed of 11.79 miles per hour, and it ascended a grade of 17 feet per mile in a curve of less than 1000 feet radius at the rate of 6 or 7 miles an hour. Engines of such power, as were here displayed, would seem to be capable of doing any kind or amount of business that commerce or intercourse should demand; nevertheless, those subsequently made, whilst they have been somewhat augmented in mass, have come forth with a power of steam and of traction hitherto unequalled, weight for weight, it is believed, in the operations of the locomotive steam engine. One of them drew upon the occasion of opening the branch to Washington, on the 25th of August last, 250 persons in 5 eight-wheeled coaches, being a gross weight of about 47 tons; at a speed of 20 miles an hour, and at this rate too up the ascents of 20 feet to the mile, of which grade there are on that road 5 or 6 consecutive miles.

The power of one of the new engines of 8 1/2 tons, called the "George Washington," was recently tested upon the Washington Branch Railway. It drew a train of 30 freight cars and one passenger coach, weighing, exclusive of the engine and tender, 113 tons gross. With this load the time in passing over 29 miles of the road towards Washington was 2 h. 44 min. 30 sec., including the time consumed in stopping by the way to replenish with water, &c., amounting to 32 min. 40 sec. And the time employed in returning over the same distance, with the same train, was 2 h. 30 m. 33 sec., including stoppages to the amount of 25 min. 55 sec. In the one direction the average velocity whilst in motion was, therefore, 13.2, and in the other 14 miles

per hour. The road at the two ends of the journey is nearly upon the same level, yet the part at Washington is lower by about 20 feet than at the commencement of the branch at the Patapsco.

The average speed, though great with the enormous load mentioned, does not furnish a just measure of the full power of this engine: on account of the extent of the level and descending parts of the way, the speed might have been much greater, but extreme velocity was not the object of the experiment, and the supply of steam in the cylinders was regulated by the Engineer so as to approximate to a uniformity of speed upon all parts of the road. It is upon the ascending parts of the Railway, therefore, that we are to look for the full display of power on this occasion: and it was observed that the train ascended 5 consecutive miles of the road, having a uniform ascent at the rate of 20 feet to the mile, in 26 min. 8 sec., being a velocity at the rate of 11.48 miles per hour. Here, the weight of the tender being 5½ tons, and the resistance upon a level part of this Railway being assumed at 11 lb. per ton, the force of traction required to balance the friction and gravity of the train of 113 tons was 2203 lb. whilst, allowing for the gravitating tendency down the descent, of the engine and tender, it will appear that the engine did, upon this occasion, exert a power of traction, (beyond what was sufficient to overcome the friction upon a level, of itself and tender) equal to 2322 lb. at a speed of 11.48 miles per hour; being equal to the conveyance upon a level at this velocity of a train of cars weighing gross 211 tons.

This engine, with several others of the same model, have been built during the past year, at the Company's workshop, by the contractors Davis and Gartner, which firm is now dissolved in consequence of the lamented death of Phineas Davis, the efficient partner, who attended personally to the planning and construction of the engines; and to whose genius and worth, the world is indebted for several valuable improvements in Railway machinery.

For the operations relating to transportation, I must refer to the Report of the officer having charge of that department of the service.

With the approbation, and at the solicitation of Samuel Sprigg and Joseph Caldwell, Esquires, on behalf of the citizens of Wheeling and its vicinity, and of John Thompson, Esq., residing at the Flats of Grave Creek, on behalf of the interests at that place and its neighborhood, I commenced early in the month of May last, a reconnaissance of the Alleghany mountains, and the country generally, from Cumberland, in Maryland, to the Ohio River at Wheeling, and likewise at the Flats of Grave Creek, in Virginia, with a view to judge of the practicability of obtaining a route for a Railroad from the Potomac at Cumberland, to the Ohio River at the points just mentioned.

The examination was likewise carried to the Ohio River, at the city of Pittsburgh.

In the course of this reconnaissance, many difficult defiles in those mountainous regions were penetrated and examined, and connections traced between the gaps, which nature has formed, in the various parallel chains of which the Alleghanies are composed; and access was had to all the authorities that could shed light upon the topography of the country in question, either as to distances or attitudes.

These examinations have resulted in a perfect conviction on my part, of the en-

tire feasibility of a Railroad from Cumberland to the Ohio River: and moreover, that it is entirely practicable to construct a Railroad, within reasonable limits of expense, from Cumberland to Wheeling, and likewise to Pittsburgh, upon which the motive power may be that of steam by locomotive engines, and dispensing entirely with fixed or stationary engines, with their inclined planes, ropes, and other fixtures.

For a more detailed account of the reconnaissance and the results, and of the capabilities of the locomotive engine in traversing different grades at various velocities, reference is made to my report to the Committee of the 30th ult. upon that subject; which report I hereunto annex, accompanied with a map of the country from Cumberland to the Ohio River, exhibiting the routes examined.

Respectfully submitted,

J. KNIGHT,

Chf. Engr. Baltimore and Ohio Railroad.

## RAILROAD INTELLIGENCE.

### CHARLESTON AND CINCINNATI RAILROAD.

In this number will be found the Report referred to in our last in relation to this contemplated improvement. With this, and the more certain improvements in Pennsylvania and Maryland staring us in the face on the South—the Railroad from Albany to Boston on the East—and the improvements going on in Canada on the North—it becomes the State of New-York to move, soon, steadily, onward, or be eclipsed as she will richly deserve, and as we hope she will, by her more considerate and enterprising neighbors.

### Railroad from the Banks of the Ohio River to the Tide Waters of the Carolinas and Georgia.

PROCEEDINGS IN CINCINNATI.—On Monday evening, August 10th, 1835, a public meeting of citizens of Cincinnati was held at the *Commercial Exchange*, for the purpose of promoting the construction of a Railroad, from Newport or Covington, opposite Cincinnati, to Paris, in Bourbon county, Kentucky. After the requisite proceedings on this subject were concluded, Dr. Daniel Drake offered the following resolution:

Resolved, That a committee of three be appointed to inquire into the practicability and advantages of an extension of the proposed Railroad, from Paris into the State of South Carolina.

Which, being unanimously adopted, Dr. Drake, J. W. Bakewell, and J. S. Williams, were appointed said committee.

The meeting then adjourned till the next Saturday, the 15th, when a number of gentlemen from Newport and Covington were present. An elaborate report from the pen of Mr. Williams having been made on the subject of the Railroad to Paris, and the steps necessary to promote a survey of the route taken, the committee on the extension of the road into the southern States, were called upon, when Dr. Drake presented and read the following report:

The committee to whom was referred the subject of a Railroad from the valley of the Ohio River to the maritime coast of the Carolinas and Georgia, having in a general manner considered its practicability and

advantages, beg leave to submit the following—

### REPORT.

The States which border on the Ohio, or are watered by its great tributary streams, are western or tramontane Pennsylvania and Virginia, Ohio, Indiana, Illinois, Kentucky, and Tennessee; nearly through the centre of which that river flows, almost parallel with the sea coast of the old southern States. From the seven States above mentioned, there are highways of communication with the ocean in but two directions—northeast, and southwest. The former, consisting of several distinct lines of river, canal, Macadamized and Railroad communications, reaches the Atlantic ocean between the west end of Long Island Sound and the mouth of the Chesapeake Bay—from New York to Norfolk—a distance, on a straight line, of 300 miles: The latter communicates with the Gulf of Mexico by the delta of the Mississippi. Between these two points of marine connection with the interior, is a coast nearly 3000 miles in extent, constituting the seaboard of southern Virginia, North and South Carolina, Georgia, Florida, Alabama, and Mississippi, with which the States in the valley of the Ohio have no direct communication, even by means of a good post road, so that the mail to the northern frontier of Georgia and the Carolinas, not three hundred miles distant from the banks of the Ohio, in a straight line, is actually sent by Washington City, on a route nearly four times as long. With that part of the southern coast which lies west of the peninsula of Florida, the Ohio States have ready intercourse, by the Mississippi River; but with the region east of that peninsula, they are destitute of all adequate means of commercial and social connection. Here then is a great desideratum, which can be supplied in no other manner than by the contemplated Railroad.

Starting, perhaps from more than one point on the Ohio River, in the State of Kentucky, this road should stretch nearly south; and branching, when it enters the Carolinas and Georgia, to reach their tide waters at several different places. Taking Cincinnati as a city intermediate between Maysville and Louisville, and Charleston as intermediate between Wilmington, in North Carolina, and Augusta, in Georgia, the road might be said, more especially, to connect Cincinnati and Charleston, and may for convenience in this report, take its length and designation from those two cities. Starting from the former, or rather, from the opposite bank of the Ohio River, in Newport or Covington, it would traverse the State of Kentucky to the Cumberland Gap, near the southwestern angle of the State of Virginia, then cross the State of Tennessee, and, ascending the valley of the French Broad, in North Carolina, arrive at Greenville, or some other point, in South Carolina, beyond the Alleghany mountains, whence it may pass down to Augusta, in Georgia, by one branch, and by another more immediately to Charleston, in the direction of Columbia. In traversing North Carolina, it might, with facility, the surface of the country permitting, be connected by a lateral road, with the projected Cape Fear and Yadkin Railway; which passing through Fayetteville, is to terminate at Beatty's Ford, on the Catawba River.

The distance between Cincinnati and Charleston, on a straight line, is about 500, which would probably require a Road of 700 miles. South Carolina, however, has al-

ready made a Railway, 135 miles in length, to Hamburg, on the Savannah River, opposite Augusta, nearly in the direction of Cincinnati; and the contemplated Railroad to Paris, in Bourbon county, Kentucky, exactly in the course of Charleston, (for the construction of which there are, in the opinion of your committee, a great many weighty reasons of a local nature,) would have a length of about 90 miles, thus leaving but 475 miles to complete this new and most important communication, between the interior and the sea-board of the south.

The middle of this main trunk would be intersected by the projected Railroad from Richmond, Virginia, via Lynchburg, to Knoxville, in East Tennessee, by which the Old Dominion would acquire a new channel of intercourse with her daughter, Kentucky; and also with several of the States formed out of the North-Western Territory, which was once her property, travelling from the West to southern Virginia, being thus restored to the route which it took in the infancy of our settlements.

By an extension west, to Nashville, of the Richmond, Lynchburg, and Knoxville Road, the whole of central and northern Tennessee would be enabled, with great facility, to communicate with the Carolinas and Georgia, by means of the southern extremity, with the State of Ohio, by means of the northern extremity of the great highway under consideration.

From the maritime terminations, and the lateral branches of this extended trunk, let us turn our attention to the northern or continental connections which it would establish.

These would extend, both east and west, from Cincinnati, for several hundred miles, and through every intervening northern point. First, the Ohio River would connect it with western Virginia and western Pennsylvania—embracing the valleys of the Great Kenhawa, Monongahela, and Alleghany rivers; Second, the Ohio and Erie Canal, from Portsmouth to Cleveland, already finished; the Miami and Maumee Canal, in progress from Cincinnati to Lake Erie, uniting at Fort Wayne, with the Erie and Wabash Canal of Indiana; and the Mad River and Sandusky Railroad, from Dayton to the Lake, the execution of which has commenced, would connect it with the entire chain of northern lakes, from the Falls of Niagara to the Straights of Mackinac, and even Green Bay, on the western shore of Lake Michigan, including the eastern border of Wisconsin Territory, north or maritime Illinois and Indiana, the whole of Michigan Territory, a part of Upper Canada, and the centre and northern declivity of Ohio: Third, the Wabash and Erie Canal, just mentioned, and the Railroad from Lawrenceburg, at the mouth of the Great Miami, to Indianapolis, already begun, would carry its advantages into the depths of Indiana: Fourth, the Ohio River from Cincinnati to the Mississippi would connect it, beneficially, with south and west Illinois, Missouri, and the immense extent of unsettled territory watered by the upper Mississippi and Missouri Rivers. Thus the proposed main trunk, from Cincinnati to Charleston, would resemble an immense horizontal tree, extending its roots through, or into, ten States, and a vast expanse of uninhabited territory, in the northern interior of the Union, while its branches would wind through half as many populous States on the southern sea-board.

The extent of this inland communication from north to south, through the centre of the United States, would comprehend at least 15° of latitude, and could only be com-

pared with that established by the Mississippi River. It would not indeed be limited by the continent, for, as many important islands of the West Indies are contiguous to South Carolina, they would, in fact, be comprehended in the new facilities of intercourse that would be established between the south and north, and should, therefore, be taken into the estimate.

Of the physical practicability of constructing the main trunk of the proposed Railway, across the States of Kentucky, Tennessee, and North Carolina, your committee see no reason to entertain a doubt. It is true, that it must traverse many of the branches of the Cumberland and Tennessee rivers, and scale the southern extremities of the Alleghany mountains. One of the branches, however, of the latter river, the Erench Broad, as we have already seen, originating on the slopes of the Blue Ridge, the most southern of the mountain chains, runs to the north, traversing the western angle of North Carolina, to unite with the Tennessee, thus opening a pass through a part of the mountains, and inviting to the enterprise. Of the height of the remaining mountains, your committee cannot speak with confidence, but believe it to be less than that of the Alleghanies, where they are traversed by the Railroad and canals from Philadelphia to Pittsburg. However this may be, no decision of the question of physical practicability can be made, but by competent engineers, on an actual examination of the route.

The question of expense can of course only be settled by the same means. Assuming that the projected Railroad from the Ohio River, opposite Cincinnati, to Paris, in Bourbon county, Kentucky, will, from the considerations limited to the region of country concerned, be most certainly executed, and referring to the actual completion of the Railroad from Charleston to Augusta, the intervening section would not, as we have seen, exceed 475 miles, which, at the high price of 12,500 dollars per mile, would not amount to 6,000,000 of dollars; a sum not greater than is about to be expended by a company of capitalists, in the construction of a Railway within the State of New-York, to run nearly parallel with her Grand Canal, and connect the same waters with the same city.

It may be said, however, that the central part of the Cincinnati and Charleston road would run through a country but thinly inhabited, and furnishing little aid, either in the construction of the road or in swelling the amount of transportation upon it. But why is it so sparsely peopled? Manifestly, in part, because, of all portions of our common country, it is the most inaccessible and the most destitute of facilities for the exportation of its iron, salt, coal, tar, turpentine, and other natural productions. To wait, therefore, for a denser population, as a condition for commencing a great work of internal improvement, which only can augment that density, would be to wait for the development of an effect, before resorting to the only cause that can produce it. Let the road be executed, and an instantaneous impulse will be given to improvement in that region. If, however, it were too sterile for such a result to occur, no argument against the project could arise from that fact, for the undertaking is necessary to the reciprocal exchange of the production of the States penetrated by its extremities, in which respect it would be similar to the Philadelphia and Pittsburg route, which, in a part of its course, passes over uninhabited

mountains, and still facilitates an immense trade between the east and west.

Thus it is not necessary that the whole line of an artificial way should lie through a cultivated and populous country, nor need we look to the inhabitants along this or any other projected Railroad or Canal, for the means of its construction. These will be furnished by the capitalists of any and every part of the country, or even by those of Europe, the moment the enterprise is authorised by the States through which it is to be carried on, and the probabilities of a profitable investment are rendered manifest. In the opinion of your committee, the States of Kentucky, Tennessee, and the Carolinas, might, in their sovereign capacity, execute this work, and make it a rich and lasting source of revenue; and, they have as little doubt, that the incorporated joint stock companies would at once be able to command the requisite capital.

Your committee are of opinion, that the strongest motives exist for the immediate execution of this great work. At least half the people of the Union, comprehended, in whole or in part, in East Florida, Georgia, South Carolina, North Carolina, Virginia, Pennsylvania, Tennessee, Ohio, Michigan, Indiana, Illinois and Missouri, are interested in its completion, as they would instantly participate in its advantages; and, as your committee believe, need only to investigate the subject, to be at once aroused to efficient action.

Would it pass, like the New-York Canal, or the projected Railroad from Augusta, in Georgia, to Memphis, in Tennessee, nearly from east to west, and consequently combine regions which have similar climates, and identical productions, its value would be far less. But, as we have seen, stretching boldly from north to south, and, with the present and future public works of the States between the Ohio River and the Lakes, establishing a high road of communication through nearly all the climates and varieties of soil, productions, and people of the United States, it would forever stand alone and conspicuous among the public works of the Union, both in the kind and amount of commercial and social intercourse which it would promote.

The sustenance and manufactures of the corn States, from Kentucky to Michigan, would instantly pass along it to the southern consumer, of the region from Cape Florida to the Chesapeake Bay, avoiding all the delays, commissions, dangers of the river, and dangers and damages of a tropical sea voyage which belong to the Mississippi and Gulf route; and even much of the produce that might be designed for coasting or foreign exportation, would reach the seaports of South Carolina and Georgia, by the same channel, instead of going to New-Orleans or New-York. On the other hand, the tropical productions of the northeast of Cuba, and of East Florida—their spices, sugar, oranges, lemons, and figs;—and the indigo, rice, and cotton of Georgia and Carolina would, by the same direct route, penetrate, in a few days, the interior of the continent, and spread among the consumers, even to the shores of Lake Superior.

Some of your committee, indeed, incline to the belief, that the same channel would, at no distant time, become an inlet for many of the productions and manufactures of foreign countries; for commerce, as far as possible, should be based upon a direct exchange of productions and commodities. Thus the shipping merchants of Charleston and Savannah, might barter their cat-

tion in Europe for manufactures required by the people of the States in the Valley of the Ohio, and exchange the same for their sustenance; the whole operation, both continental and marine, being performed without the instrumentality of any other money than that employed in defraying the expenses of transportation.

Of the amount of the business that would, at length, be conducted on this national highway, the committee scarcely dare to speak. To them it appears of a magnitude, which they fear the meeting and the community at the present time would regard as extravagant and incredible. By the existing population of the portions of country, even now connected with the work, there would be a great amount of travelling and transportation; but the extent to which it would augment the population of the zone of country through which it would pass; the impulse to agriculture it would impart; the manufacturing establishments it would set up, and the lateral Turnpikes, Railroads and Canals it would suggest, to new districts of country, from the western slopes of the Allegheny mountains to the banks of the Mississippi, from the sea to the lakes, would make it the parent of a great system of central internal improvement, and enable it to augment the amount of its articles of transportation to an indefinite degree. These immense pecuniary benefits, accruing to millions of people, should, of themselves, prompt those who are interested to an immediate attention to the work; but there are other and nobler considerations, which should not be overlooked.

No public work could contribute more powerfully to our national defence. Establishing a direct and rapid communication, between the northern and southern frontiers of the United States, separated, unlike the eastern and western, from the dominions of foreign nations by narrow sheets of water only, it would afford facilities for the transportation of troops, munitions of war, and military sustenance, from the centre to the borders, or even from one frontier to the other, with unexampled rapidity; thus favoring a concentration, requisite to national defence in time of war, which could not otherwise be effected; and which would present a new triumph of civilization over barbarism, by making civil public works, an efficient substitute for standing armies and powerful navies, which exhaust the resources and endanger the liberties of a nation.

But the most interesting and affecting consequences that would flow from the execution of this enterprise, would be the social and political.

What is now the amount of personal intercourse between the millions of American fellow-citizens, of North Carolina, South Carolina, and Georgia, on the one hand, and Kentucky, Ohio, Indiana, and Illinois, on the other? Do they not live and die in ignorance of each other; and, perhaps, with wrong opinions and prejudices, which the intercourse of a few years would annihilate forever? Should this work be executed, the personal communication between the north and south would instantly become unprecedented in the United States. Louisville and Augusta would be brought into social intercourse; Cincinnati and Charleston be neighbors; and parties of pleasure start from the banks of the Savannah for those of the Ohio River. The people of the two great valleys would, in summer, meet in the intervening mountain region of North Carolina and Tennessee,

one of the most delightful climates in the United States; exchange their opinions, compare their sentiments, and blend their feelings—the north and the south would, in fact, shake hands with each other, yield up their social and political hostility, pledge themselves to common national interests, and part as friends and brethren.

Finally, the immense summer throng of visitors which annually go up to the north, along the seaboard, would be made still greater, and turning westwardly, through the States of Virginia, Maryland, Pennsylvania, and New-York, spread over the northern centre of the United States, to the shores of the Lakes and upper Mississippi; concentrating on their return in the Valley of the Ohio; having seen what they now never see, and made acquaintance with what at present is unknown to them, the very heart of the Republic. On the other hand, the people of the north would, in autumn and winter, pour down upon the temperate plains of the south, in turn, studying their political, civil and literary institutions, participating in their warm hospitality, catching a glow of southern feeling, gratifying their curiosity, and return enlarged in their patriotism and enriched in their knowledge of our common country. Thus, this travelling, alone, would, at no distant day, reimburse the expenditures by which it might be created, while it would unite with the ties of business, in confining with a new girdle, States which are now but loosely connected, and thereby contribute powerfully to the perpetuity and happiness of the Union.

DAN. DRAKE,  
T. W. BAKEWELL, } Committee.  
JNO. S. WILLIAMS,

Cincinnati, Ohio, August 15, 1835.

On motion of J. D. Garrard, Esq., seconded by General James Taylor, of Newport, the report was unanimously adopted.

Dr. Drake then offered, from the committee, the following resolutions, which were severally adopted:

#### SUPPLEMENTARY REPORT.

The Committee to whom was referred the subject of a Railroad from Ohio to South Carolina, having prepared a series of resolutions to be offered in case their report should be adopted, beg leave to present the following:

1. Resolved, That a Standing Committee of Inquiry and Correspondence be appointed, consisting of seven members—four from Cincinnati, two from the adjoining part of Kentucky, and one from eastern Indiana; four of whom shall be a quorum.

2. That it shall be the duty of said Committee to elect from their own body a Chairman and Secretary, and take immediate measures for the publication and dissemination of the report just adopted, together with such communications as they can promptly obtain, and such an address of their own as they may consider relevant to the subject.

3. That it be recommended to them, to make an immediate communication to the Governors of each of the States and Territories, interested in the proposed work, requesting them to bring the subject before their respective Legislatures, at their next sessions.

4. That they be requested to adopt such measures as may be practicable to inform and interest the people living near the proposed Road, relative to the subject.

In pursuance of the first resolution, the following gentlemen were appointed a

Standing Committee of Correspondence and Inquiry:

Gen. William H. Harrison, } Of  
James Hall, Esq., } Cincinnati.  
Edward D. Mansfield, Esq., }  
Dr. Daniel Drake,  
Gen. James Taylor, Newport, Ky.  
Dr. John W. King, Covington, Ky.  
George A. Dunn, Esq., Lawrenceburg, Ia.

The meeting then adjourned, subject to the call of the Committee.

T. W. BAKEWELL, Chairman.  
JAMES McCANDLESS, Secretary.

RAILROAD ACROSS THE MOUNTAINS.—It will be seen that the Mayor, at the request of a number of citizens, has called a town meeting at the Exchange, to-morrow, the 19th inst., at 12 o'clock, for the purpose of considering the subject of the construction of the railroad from Cumberland to Brownsville, and thence to Pittsburg and Wheeling—and of appointing delegates to represent this city in the Convention which is to be held at Brownsville on the 25th instant. The work in question is of vital importance to Baltimore, and is worthy of all the aid which can be brought to bear upon it.—[Baltimore American.]

#### CANAL INTELLIGENCE.

We insert with pleasure the annexed correction:

[FOR THE NEW YORK AMERICAN.]

ERROR CORRECTED.—Mr. Editor: Will you permit a stranger from the City of Brotherly Love, to remove an impression made in your paper last evening, that might, and probably has led some of your readers to suppose the tolls received in Pennsylvania, for the year ending on the 1st of November, amount to the sum of \$403,008, and no more, on the Inland Improvements, in that State. Your paper says:

"PENNSYLVANIA.—The receipts from the Canals of the State, for the year ending November 1st, were \$403,008. Those from the New York Canals, for the same period, will more than treble that amount."

The Auditor General of Pennsylvania reports:

The receipts on the public canals, for the year 1835,	\$403,008
do on the public railroad uniting the main canal, between Philadelphia and Pittsburg,	981,379
	684,387

To which add—Schuylkill canal, for the year, (an incorporated company,)	380,000
do Union canal, leading from the Schuylkill to the Susquehanna,	175,000
do Lehigh canal, leading from Mauch Chunk coal mines to the Pennsylvania canal, at Easton,	130,000

Making together, \$1,308,387

This amount may be fairly considered the product of Tolls on the Pennsylvania improvements, for the year 1835, independent of the Chesapeake and Delaware canal, and a variety of railroads leading from the city of Philadelphia into the interior of Pennsylvania.

VIATOR.  
New York, December 1st, 1835.

THE MORRIS CANAL was closed on the 19th inst. for the season. The water was drawn off one month earlier than usual, in consequence of the necessity of altering the Inclined Planes, and making other improvements to facilitate the navigation with increased tonnage, previous to the cold weather setting in.

The total number of boats which have been cleared during the season at the head of the Canal at Easton, for Newark and intermediate places, is 2086, carrying 41211 tons, 13 cwt. We understand that arrangements are in progress to get the Canal in operation at an early day in the Spring, when the business will be increased by enlarged facilities, heretofore wanting.—[Newark Daily Adv.]

## AMERICAN RAILROAD JOURNAL. NEW YORK, DECEMBER 19, 1835.

THE RAILROAD JOURNAL, although delayed two weeks by the late conflagration, by which nearly all my printing materials, and back volumes, and numbers, were destroyed, is dated, and numbered, as it would have been, if issued at its proper time—the two following numbers, which will complete the volume for 1835, will also be dated in the same way, in order to keep the volumes within their respective years.

This delay from the above cause has been unavoidable; I hope, however, to be able to issue the two ensuing numbers and the last of volume 4 in a few days—and also to bring out No. 1, of volume 5, in an improved style, by the 15th or 15th instant.

Editors of newspapers, who may receive this number, will, by giving it an insertion, or by referring to the facts, confer a particular favor on their obedient servant,

D. K. MINOR.

New York, January, 1836.

We are promised, by our correspondent in Albany, and shall undoubtedly receive at early dates, copies of all important documents in relation to the subject of the Internal Improvements of this State, which we shall endeavor to lay before our readers.

### LOSSES BY THE LATE CONFLAGRATION.—

Amongst the other losses which we have sustained by the fire, is that of nearly all our *Railroad and Canal Reports*,—as well those which had not, as those which had, been republished, in whole or in part in the

Journal. This will cause much inconvenience, as we had occasion frequently to refer to them—especially to those of the Baltimore and Ohio Railroad Company—the last of which was in course of republication.

We shall esteem it a great favor if our friends will favor us with duplicate copies at their earliest convenience.

To CORRESPONDENTS.—We owe an apology to many of our correspondents, but to none perhaps as much as Major VOORHIES, of Avoyle Ferry, La., who has for years past furnished us with a monthly meteorological table, accompanied by remarks in relation to the weather, and crops of the country—which we have always published until within the last four months, and should have continued them regularly, during that time, but for having, for a time, mislaid those for August and September, which came together, and while the editor was confined to his room. They have however come to hand again, and will be published in our next, and those for October and November in the following number.

In the mean time, we publish the following extract from the Major's letter of December 8th, in relation to Texas. The address of the President of the Texian Council, which accompanied this letter, will appear next week.

Avoyle Ferry, on Red River, La.,  
Dec. 8, 1835.

D. K. MINOR,

Editor Am. Railroad Journal:

Sir,—Enclosed is a copy of Meteorological Table for November, 1835, regularly entered as stated.

Most respectfully,

Your obedient servant,

P. G. VOORHIES.

I also enclose you a slip relating to Texas.

A report has reached us, that wants confirmation, that Gen. Cos sent out a detachment from St. Antoine—that the Texans defeated them, and took a brass six pounder. Whenever an official report reaches here, I will forward it.

Your obedient servant,

P. G. VOORHIES.

194 Rifle Volunteers, part from Kentucky, Tennessee, Mississippi, and Alabama—(from Natchez)—passed up this week, (in the steamboat *Batesman*) bound for Texas. (What will the volunteers do for provisions?)

BALTIMORE AND OHIO RAILROAD.—We commence the re-publication of the Report

of Jonathan Knight, in relation to his examination of the route of this Railroad over the Alleghanies, both to *Wheeling*, in Virginia; and to *Pittsburg*, in Pennsylvania; and shall continue it as soon as we can obtain another copy of the Report from Baltimore, ours, except a few pages, having been destroyed by the late fire.

This report should be attentively read by those who desire to obtain accurate information in relation to those, hitherto considered, almost impassable barriers, the Allegheny mountains.

A route, and a far more favorable one than was anticipated, has been discovered, both to Pittsburgh and Wheeling, on which stationary power will not be required.

NEW JERSEY RAILROAD.—We find in the Newark Daily Advertiser of December 7th, an interesting account of the opening of the Railroad between Newark and Elizabethtown. We were aware that this work was progressing rapidly, but not that it was yet in readiness for use.

We also learn, that in a very few days it will be opened for use to Rahway, and, at an early period, to New Brunswick—thus completing another portion of the line between this city and Philadelphia, the whole of which, it is to be hoped, will ere long be in successful operation.

It was our intention to have published the account from the Daily Advertiser, but this long delay occasioned by the destruction of our office must be our apology.

When the road is opened to Rahway, we hope to participate in the pleasure of the event.

TENNESSEE.—This State seems resolved to act with energy. The Legislature have a Bill before them proposing to appropriate \$500,000 to the Nashville and New Orleans Rail Road, \$300,000 to the Western Rail Road Company; \$1,500,000 to construct a Road from the Nashville and Orleans Rail Road to the eastern extremity of the State; \$750,000 for a Rail Road from Charleston to Cincinnati through East Tennessee; and \$250,000 to the Atlantic and Mississippi Rail Road.

## INTERNAL IMPROVEMENT CONVENTION.—

The time approaches for the assembling at Albany of the adjourned Convention, for the purpose of taking into consideration the subject of *Internal Improvements* in the State of New York.

There are, fortunately for the prosperity of the people, those who know and feel that extensive fields for improvement, are still open, and that all parts of the State are now equally entitled to the fostering care of liberal Legislation. They feel, too, that the fact that the State has expended large amounts of money to accomplish one or two important works, with their appendages, is no reason why other equally important works should be left for the enterprise of individuals. It may appear very clear to the more enlightened minds of some gentlemen who have made princely fortunes by the operation of those works which have been wholly constructed by the State, why other works—the utility of which will, to say the least, be every way equal, so far as the business community is concerned, to those already constructed—should be left to be “made and owned by the Company when done;” but to us, and thousands of others, whose only interest is to be found in the prosperity of all classes of community, and all parts of the country, it does appear passing strange that rational and honorable men, upon most subjects, should be found, who utterly oppose whatever may tend, not to depress them at all, but, to elevate their neighbors, in some degree to their level, by a liberal and general, as they themselves have been elevated by a partial, distribution, or rather application, of the resources of the State.

Why it is that men are so constituted it would seem difficult to divine; but so, unfortunately, it is, and we must therefore encounter, in all great enterprises, not only their natural difficulties, but also the prejudice, and interested opposition of some from whom better things would naturally be anticipated. It is to be hoped, however, that, at this Convention, the important subject upon which it shall have assembled will be considered, discussed, and treated with enlarged and liberal views; and that the interest, prosperity and happiness of the people, and the whole people, will be the leading and prominent principle of its action.

A important era in it, no one who has seen can doubt; nor is it of this Convention and prosperity, so much as of the measure depends.

It therefore becomes the duty of every man who may be selected to attend this Convention, and who has a particle of State pride and public spirit, to direct himself of ac-

tional and selfish feeling, and act as becomes a citizen of the State of New York.

It will be observed, by the extract from the annual message of the Governor of Ohio, which we give in this number, that the competition for the trade of that, and other western and south-western States, is one of no small interest to her; and it will be also observed by the letter of John S. Williams, of Cincinnati, in relation to the *Cincinnati and Charleston, South Carolina Railroad*, that another, and an unlooked for competitor is about to enter the field for that trade. It is therefore now doubly the duty of those whose feelings and interests are all centered in the State of New York, to come forward and give their aid to all such works as will tend to retain the present, and secure the future trade of that vast and fertile region beyond the Lakes and the Alleghanies.

Amongst these works, and perhaps the most important at this period, are the *New York and Erie Railroad*, the *New York and Albany Railroad*; on the east side of the Hudson; the *enlargement of the Erie Canal*, and *connecting it with Oswego*; and a *SHIP CANAL AROUND NIAGARA FALLS*.—These are works which, when completed in a proper manner, and met, as they will be met by corresponding works from the west, will put all successful rivalry at defiance, and make this city the *London of the world*—that is the largest city in the world—but if, on the contrary, sectional feeling and self-interest are permitted to bear sway, and all improvements which do not pass through, or terminate at, any particular place, are to be opposed and defeated, then may we look elsewhere as we should deserve to, for the means of becoming what nature has destined us to be, and what but for a selfish suicidal policy we should be, the commercial emporium, eventually, of the world. Of the correctness of this prediction some may doubt, but one moment's reflection by an intelligent mind, will satisfy it that there is no city in the world with equal natural and permanent advantages within itself for business; which has such an extensive, almost unlimited, and so fertile a country, intersected by such watercourses and studded by such inland seas, as New York! And nothing is wanting to make these important advantages available but a liberal spirit, and the active and determined perseverance of those who take pride in being citizens of the State of New York. It therefore becomes the imperative duty of this Convention to adopt such measures as will ensure the construction, at the earliest possible period, of those important works herein mentioned, together with such intersecting lines from the Lakes, and the Canal, with the New York and Erie Railroad, and from the New York and Albany Railroad, to the interior of New England, as will insure an easy, cheap, and rapid intercourse with all parts of this, and the adjoining States.

## INTERNAL IMPROVEMENT.

The following is an extract from the Annual Message of the Governor of Ohio to the legislature, made on the 7th inst. We are gratified to find that the projected Niagara Canal, has received his favorable attention. The State of Ohio has a most important interest in the success of this enterprise, and we look to her citizens and Legislature to give it an efficient support.

“It is deemed important that the public mind should be directed to the various public works that have been projected in other States, which must have an important influence upon the interests of Ohio. In addition to those which have already been completed in New York and Pennsylvania, I would mention the construction of a ship Canal round the falls of Niagara, thereby uniting Lake Ontario with Lake Erie. (A report of a Committee in New York appointed to memorialize Congress on that subject, is herewith transmitted, marked A.) Thence as we progress south and south-west, we see the project of the great western Railroad from New York through Ohio to the Mississippi; the Chesapeake and Ohio canal; the Baltimore Railroad; the Winchester turnpike road; the James river canal, which is intended to be extended to the Ohio river, either by canal, Railroad or turnpike road; and the Charleston Railroad; (a branch of which, with a view to the construction of a turnpike road was some years since reconnoitered, passing through the Alleghany mountains at the head of Nolichucky in North Carolina, and extending thence through east Tennessee, western Virginia and the eastern part of Kentucky, to the Ohio river, opposite the Southern termination of the Ohio canal at Portsmouth.) The attention of the public, I am happy to learn, has been recently drawn to the importance of a communication between the southern Atlantic States and the great western States.—The project of a Railroad from Cincinnati, in this State, to Charleston in South Carolina, has excited the attention of the southern States. A report of the present committee of the Charleston Chamber of Commerce on the subject of the contemplated Railroad, from Charleston to Cincinnati, and the proceedings of the citizens of Charleston, embracing the report of the committee, and the address and resolution adopted at a general meeting in reference to the proposed railroad from Cincinnati to Charleston, are herewith transmitted for your consideration marked B and C. I perceive also in the communications of the Executives, of North Carolina and Georgia, to their respective Legislatures, that the attention of these States has been partially drawn to the important subject of direct communication with the North Western States. All these communications can be no less important to us in the West than they are to our neighbors in the South-East and North, and if accomplished, will unite us in a community of interests that must be highly beneficial to all.”

LETTER FROM J. S. WILLIAMS, CIVIL ENGINEER,  
To Dr. Daniel Drake, of the Committee of  
Correspondence and Inquiry:—

DEAR SIR,—Your note of the 18th inst., requesting me, if convenient, "to contribute any facts, observations, or suggestions, in addition to those contained in our report on the subject of the Cincinnati and Charleston Railroad," is received, and in answer thereto I may inform you that I have very few, if any, ideas not contained in that report, but have taken efficient measures to collect information, both general and particular, relative to every bearing of the subject, which shall be at the call of your committee as soon as it is in my possession.

The subject of connecting this city with Charleston, S.C. cannot be too closely examined nor too fully investigated. It is one that involves the interests, if not the destiny, of millions of Americans, born and unborn. The experiment we propose, differs in many respects from anything heretofore tried, and which, if carried out, would produce the happiest results. It would strengthen the bonds of union between the cotton-growing, slave-holding, and the wool-growing, victualing districts. It would cross a line of demarcation over which a work of internal improvement has not yet been prosecuted. By means of the proposed work we should enter into the closest connection and union of feeling, with those to whom we are total strangers, farther than the mere circumstance of belonging to the same great confederacy makes us familiar. At present, in a national point of view, we have less sympathy for our fellow citizens of South Carolina, than we have with those of Louisiana, although the separation from the latter, both by distance and national origin, is greater than from the former. Construct but the proposed work, and we should habitually call those our neighbors and friends, who now feel to us as foreigners. Intermarriages would take place, and personal acquaintance would be the result followed by friendships, instead of the present estrangement from those who are politically our brethren. As things are, some of us transfer our dislike of slavery to the persons of the slave owners; but were we more intimately acquainted with the circumstances that surround them, we should treat the subject as their misfortune,—not their crime; and instead of viewing the condition of slaves as always to be abhorred, we should be brought to believe that, odious as slavery in the abstract may be, it is often greatly to be preferred to degraded liberty. Our fellow citizens of the south, by becoming better acquainted with us, would not be so liable to mistake the opinions of a few for the prevailing sentiment of the north and west. Individually, I hail every effort to unite the slave holder and the non-slave holder more closely together, as tending to perpetuate our Union, to promote morality, increase religion, and establish universal freedom upon a proper and safe basis. The south, possessing a slave population, whose physical strength increases in a ratio greater than that of their owners, will, no doubt, view this additional bond of union with their white brethren as auspicious of their own safety.

It will not be an account of political economy alone that the south-east will see it her interest to be connected with the north-west. By the proposed work, her greatest emporium will be almost brought into juxtaposition with the most south-westwardly manufacturing city, and the greatest victualer in the U. States. Cincinnati, as a victual-

ler, has no rival. Within one year from this day gone, she has shipped for other ports, agreeably to the best calculations, 130,000 barrels of flour, 84,500 barrels of pork, 17,000,000 pounds of bacon, and 255,000 kegs of lard! Large quantities of these supplies are now taken by steam, or floated to New Orleans, 1550 miles; they are there shipped, and after being navigated about the same distance, in hot climates, are landed at Charleston, which might arrive there, by the proposed Railroad, in six days after being packed in Cincinnati.

The same inducements that would cause Charleston to obtain her supplies by way of the Railroad, would make her the shipping port for the most of the exports of this country destined for Europe or the eastern States. One half of the flour and pork of Ohio, now finds a port at New-York, after traversing eight hundred miles by canal, lake, canal again, and river. Might not Charleston step forward and take a share in this important trade? Again, the eastern and European goods which we receive via New-York, Albany, Buffalo, Cleveland and Portsmouth, travel 1100 miles from New-York to Cincinnati by two rivers, two canals, and the lake. Could not Charleston compete with this upon 700 miles of Railroad? Is the harbor and enterprise of that city so inferior to those of New-York? Further, the merchandise we receive from Philadelphia travels by two Railroads, two canals, and one river, 850 miles, would not a Railroad and Charleston harbor be better than this line and the Delaware Bay? Further still, from Baltimore via Pittsburgh, should the Baltimore and Ohio Railroad terminate there, to Cincinnati would be about 800 miles, would the Chesapeake Bay and this line of transportation be preferred to 700 miles of Railway? Both cities are deeply interested in the proposition, in a commercial point of view, for in no case can the dangerous and long route by the Gulf of Mexico and Mississippi and Ohio Rivers never as closely connect them as their mutual interest requires, but as other channels of transportation are opened, Cincinnati and Charleston will become greater strangers.

Add to a commercial, our manufacturing character, and a connection with us will appear still more important. We manufacture almost every American article that the southeast wants, and which we would gladly barter for merchandise taken by her in commercial transactions with the eastern States and Europe. We have upwards of fifty steam engines and much water power, in effective operation. Our steam engines rate from five to three hundred horse power each. They do almost every thing that the genius of man has yet done by steam on land, and are equal to the task of at least twenty thousand men. We are manufacturing, this summer, one hundred and eleven steam engines, and about twenty sugar mills—the engines mostly very large, and many of the very largest class. The manufacture of these takes most of the power of ten of the smaller class of our engines. Three more are in part employed in the manufacture of cotton gins. This is a new branch of manufacture among us, just springing into importance. In 1834, we made but fifty-five as the first experiment. This year we are making two hundred and forty-five, and preparations are in progress to supply the full demand next year, estimated at five hundred and thirty, and all for the Mississippi Valley. They average sixty saws—see set in cast frames, and

beautifully finished. We can make and send them to Charleston cheaper than she can either manufacture or procure them from the east, had we a quick and safe conveyance. The southeast requires at least a thousand annually, and they could not but barter on good terms for gins, but for horses or steam engines to work them. When the above thirteen engines are deducted, we have all our large and some smaller ones, numbering about forty, doing every thing in which that useful power can to aid the labor of man. We are not, moreover, behind other cities in the performance of labor that takes the almost unaided human sinew to perform. Of this class is ship-building. The tonnage that our shipyards are about to get afloat this season, amounts to 5,452 tons, in twenty-five boats, from 93 to 512 tons burthen each. This is not mentioned as forming any part of my subject, farther than the business and importance of our city is connected with it.

By comparing the proposed Railroad with other prominent works of internal improvement, its importance will stand in bold relief. New-York is now about to double the size of her Erie Canal, and also to construct a Railroad parallel with it, the entire length of the State. Philadelphia has scaled the mountains, by Railroads and Canals, and with two turnpikes. Baltimore is about to do the same, by a Railroad, not satisfied with a turnpike—Washington City is menacing the Alleghanies with the Chesapeake and Ohio Canal, and Richmond is looking this way,—and all for what? To prevent the fatness of the Ohio Valley from swimming down to New-Orleans! The experiment has not failed—New-York has enriched herself by it—Philadelphia is doing so—Baltimore, Washington, and Richmond, wish to do it, and Charleston may, if she enters for the prize. She stands in the front rank, and she will enter the list, when she finds the course clear for southern competition, and she will win. New Orleans, too, finding that steamboat navigation is too slow for her, stretches north to snatch the prize which the eastern cities are about to take; and her Nashville Railroad of about 650 miles is not considered too great a stake.

Compare that proposed work, parallel with a river capable of carrying 500 tons in one load, from point to point, with the work we are advocating, along no navigable stream. Compare the easy access of Charleston to the open Atlantic, with that of Orleans by 120 miles of river and 650 of dangerous Gulf navigation, and the difference is conspicuous. Will Nashville, will Tennessee, take that direction at all? Will she prefer 600 miles of Railway, through other States, that will deliver her produce in an unhealthy climate, behind the Gulf of Mexico and the reefs of Florida, to joining our road from Knoxville, when she will arrive at open sea with less distance? Will she prefer to pay other States her fare, when by a road through the centre of her own, she can rise to wealth and importance by the transit of her merchandise? Nay, we cannot think so. Nashville will find it to be her interest to unite with Charleston and Cincinnati, and by a union of effort, accomplish a work that will at once raise three or four States above midway importance. And who can say that within ten years from this day, a route from the mouth of the Ohio, by Nashville, Knoxville, and Charleston, will not only be the shortest and safest, but the cheapest route to Europe from the upper Mississippi—the far, far West! More might be added, but my time is

bids; less I fain would say, but my theme commands, and should I find that now, or at any future time the views of your committee have been advanced by me, it will be a source of gratification to your obedient servant,

JNO. S. WILLIAMS.

Cincinnati, August 22, 1835.

We have much pleasure in presenting some views in the following extract of a letter, to a correspondent in this city, solicited by us for publication, on this all-important subject. The writer, we trust, will pardon the liberty taken with his valuable communication, at a time when the enlargement of the Locks will claim the attention of the Canal Board and Legislature—and is a subject so interesting to this city, we may add, the whole State.

"The project of the enlargement of the Erie Canal is becoming better understood by the people in this section of the State, and great anxiety is felt at the result. The Canal Board are finding difficulties at every step. There is more difficulty in adhering to the channel of the present canal, than was anticipated. I am satisfied that a canal 70×7 feet, if properly located, from the Hudson to the Seneca river, would not occupy the bed of the Erie Canal, more than one-third or one-fourth of the distance—and but for the name of it, might as well be called a new canal. If the ground was not occupied on the north side of the Mohawk, I should say unhesitatingly that it would be better to make an entire new channel, from the Hudson to Lake Ontario. This would allow an entire new arrangement of the locks. The average lift of the present locks, is 8 feet; this is altogether too low. I would go as high as 12 or 16 feet. This would lessen their number, and consequently their cost, and the delay in passing them. The gates would be somewhat heavier, but with suitable fixtures, would be as easily worked. There are now 50 odd locks, from Utica to Albany. If this number could be reduced to 30 or 35, it would be a great point gained. I have just received a letter from one of the Engineers on the Lehigh Navigations, stating that the locks in that work, which are to be 100 by 20 feet, in the clear, are constructing with lifts of 20 to 30 feet. This is higher than I should venture to go, but it shows the views which intelligent Engineers are taking of the subject. As the act now reads, the Canal Board are authorised to erect duplicate locks. If the locks are widened to 17 or 18 feet, as they probably will be, they will admit boats of 150 tons or three times the tonnage of the present boats. The business on the canal must therefore increase three or four fold, before double locks will be required. Where then, is the necessity for expending money at this time, in the erection of double locks? There is another subject to which attention seems not to have been directed, and that is, the policy of erecting and maintaining farm bridges. For a Canal 70 feet wide these bridges should be at least 80 feet span, though I understand it is contemplated to make them 72 feet,

setting the abutments on the berm side, ten feet into the Canal, which is very objectionable. These bridges, if properly built, will cost from 1200 to 2000 dollars each, and require 200 dollars per annum to keep them in repair, making the whole cost to the State, equal to an outlay of not less than 4000 dollars for each bridge. I am satisfied that one half this amount will, on the average, pay all the damage of removing them, while at the same time the navigation will be essentially improved."

*Sixth Annual Report of the Baltimore and Ohio Railroad Company.*

(Continued from our last.)

TO PHILIP E. THOMAS,  
Pres't Baltimore and Ohio Railroad Co.

Having recently made a reconnaissance with a view to a Railroad across the Alleghany mountains, from the Potomac River at Cumberland, in Maryland, to the Ohio River at Wheeling, and at the Flats of Grave Creek in Virginia, and also at Pittsburgh in Pennsylvania, I avail myself of the present occasion to report the results, and to offer such views in relation to the scheme as shall seem just and proper.

The construction of the Baltimore and Ohio Railroad, having reached the bank of the Potomac opposite to Harper's Ferry, and its further extension up that river towards Cumberland, being staid by the terms of the compromise between the Railroad and Canal Companies, until such time as the Canal shall be, or by its charter should be, completed to Cumberland; and the liberal grant of the State of Maryland, at the last session of the legislature, being calculated to ensure a speedy completion of the Chesapeake and Ohio Canal to that point, the present was deemed by many to be a proper time to make examinations, with a view to induce the extension of the Railroad from the same point to the Ohio River. The people of Wheeling, in that spirit of enterprise for which they are conspicuous, made the first movement to procure the examination, and having obtained thy approbation and my own consent, I undertook to make the reconnaissance at such time as I could be spared from the Railroad service here. In pursuance of this arrangement, I commenced at Cumberland in the month of May last, examining the several routes hereinafter described, and completed the service in the month of August; having during the time visited this city in June, upon the business of my office as Chief Engineer.

Upon reaching Wheeling with the examination, a route was likewise viewed to strike the Ohio River near Elizabethtown, at the flats of Grave Creek. This was done at the request, and upon the representations of the citizens of that place and vicinity.—A route was also examined to the city of Pittsburgh, as the grant of the State of Pennsylvania to the Baltimore and Ohio Railroad Company, for right of way, &c. through that State, required that if the main stem of the Railroad should not terminate at the Ohio River in the vicinity of Pittsburgh, then the said Company should construct simultaneously, a lateral Railroad from the main stem to that city. Such however, is the importance of the city of Pittsburgh, and its connection with the north and west, as well as with the great Lakes, that an examination to it, would have been amply justified in the absence of any legislative injunction to that effect.

Accompanying this report is a map of the country comprising such parts of Virginia, Maryland and Pennsylvania, as are necessary to exhibit the relation of the several routes, and connection of the more important places situated upon roads or water courses, or intersected by the several lines examined and marked upon the map. There is likewise represented the route of the Cumberland road to Wheeling, as constructed by the General Government, and the route surveyed and recommended for the Chesapeake and Ohio Canal, from Cumberland to Pittsburgh, by the United States' Board of Internal Improvement, and to this map reference is made for a better understanding of what is written in this report.

Instrumental levels and surveys having been executed from Cumberland along the principal ravines and water courses, and through the more noted passes across the mountain chains, also to Wheeling and Pittsburg, in the course of operations connected with the location and construction of the Cumberland road, and of the traces of routes for the contemplated Chesapeake and Ohio Canal—I have availed of the knowledge of heights and distances so ascertained, combined with those estimated in this reconnaissance, to infer the grades that it may be necessary to establish upon any given route with a view to a Railroad.

Passing from Cumberland in any direction towards the Ohio River, we meet with a succession of mountains and ridges, nearly parallel to each other, and ranging about northeast and southwest. The difficulties presented to the eye of the traveler in his course upon the common road across the Alleghanies, would seem to forbid the construction across them of any Railroad for the purpose of general and reciprocal trade and intercourse, much less one upon which the locomotive steam engine should ply with effect and speed.—Pursuing the route of the Cumberland turnpike road, already mentioned, in the direction towards Brownsville and Wheeling, we are almost continually ascending and descending the mountain slopes for a distance of sixty miles, to the western base of Laurel Hill, near Uniontown. At the town of Cumberland, beautifully situated upon the left bank of the North Branch of Potomac, at the mouth of Will's Creek, and at the eastern base of Will's mountain, the National Turnpike road commences, and ascends that creek, through a gap in that mountain; thence turning to the left of Braddock's run, it passes through the gap of Dan's mountain, and immediately commences the ascent of the Great Savage, or the Great Backbone mountain, as the same ridge is denominated where it divides the eastern and western waters southwest of the pass through it of Savage River. The summit of this mountain upon the road, is gained in about thirteen and a half miles from Cumberland; and the top of the Little Savage mountain, a mere spur of the Great Savage, is reached at a mile and a quarter further. Between this spur and the main ridge in what is called here the Cranberry Swamp, situated about two

miles northeast of the turnpike road, heads the Savage River, which runs a southwest course about twenty miles to its junction with Crabtree creek, and thence a south-eastern course five miles to the Potomac, at about 30 miles by the course of the river, above Cumberland. Descending westward from the Little Savage to Bromley's, now Beall's tavern, the turnpike passes the ridge that here divides the eastern and western waters, or the Savage river and the Fishing branch of Piney run. This dividing ridge is called the Little Backbone mountain, and is here about 1737 feet above the level of Cumberland, or 2372 feet above the level of the tides of the Chesapeake.

The following table exhibits the principal summits, and some of the depressions traversed by this road, from its commencement at Cumberland, to its termination in Wheeling, at a point about 80 feet above the level of the Ohio River.

Names of places on the Cumberland Road.	Distance in miles.
Cumberland, Frost-town,	00
Great Savagemount summit,	11
Savage river, 2 miles from its head,	24
Little Savage mount. summit,	4
Little Backbone mountain, summit (at Beall's) dividing eastern and western waters,	1
Meadow mountain summit,	51
Casselman's river,	24
Negro mountain summit,	54
Keyser's ridge summit, a spur of Negro mountain,	2
Winding Ridge summit,	4
Smythfield at Youghiogheny river,	6
Barren Hill summit,	5
Woodcock Hill, or Briery mountain,	3
Laurel Hill, or most western mountain,	91
Munroe, at western base of Laurel Hill,	2
Uniontown,	21
Cauley's Hill,	8
Brownsville, at Monongahela river,	4
Hillsborough,	12
Washington,	12
West Alexandria,	16
Wheeling, at Ohio river,	161

The height of Cumberland above tide is here assumed to be 635 feet, as stated by N. S. Roberts, in his Report to the Chesapeake and Ohio Canal Company upon the coal mines and Railway routes from the same to Cumberland, 18th Sept., 1829. The level of a point one mile below Cumberland is stated in the Report of the U. S. Board of Internal Improvement, signed S. Bernard, Brig. Gen., Wm. Tell Poussin, Capt. Top. Engrs., Wm. Howard, Civil Engr., Washington City, 23d Oct., 1828, to be 578 feet above tide: and this point is readily conceived to be 57 feet lower than the place in Cumberland selected by N. S. Roberts, as the base of his operations. In James Shriver's map, published in 1824, the level of Cumberland is assumed to be 537 feet above that of tide water, a height that has been corrected by subsequent levellings, and especially in those conducted by Col. Abert for

the United States Board of Internal Improvement. The heights upon the turnpike road, in the preceding table, are partly taken from the profile of Shriver's map, but as the level of Cumberland was not accurate, and as the levels of the several points westward of that town, were deduced from the grades of the road which, although they may be sufficiently accurate for the purpose of such a road, are yet not so exact as levellings taken for a Canal or a Railroad, not to mention that no correction for the earth's curvature was made; some changes in the height above tide, have been made from Cumberland to Casselman's River—none, however, have been made beyond that stream, as the omission to correct for curvature would cause those parts to be represented too high: and they are yet too high, especially beyond the mountains. For instance, Brownsville, upon the river bank, about 50 feet above low water mark, is stated to be 833 feet above tide, whereas, it is probably but 730 feet, deduced as follows:

	Feet.
Monongahela River at Pittsburgh, according to levels for Chesapeake and Ohio Canal, (supposed at low water,) above tide,	648
Fall in the Monongahela, from Brownsville to Pittsburgh, as ascertained at low water, by Dr. Howard,	30
Low water at Brownsville, above tide,	678
Add for height of street on river bank, say	52
Height of Cumberland Road at Brownsville, above tide,	730
Wheeling is about 650 feet, Pittsburgh 700 feet, and Brownsville 730 feet above tide.	

It will be seen, from what is stated in the table of the heights just given, that the Cumberland Road in traversing the several mountains and streams, frequently deviates very greatly from the same level, and sometimes the change is made in very short distances. The more prominent levels only are, however, here given. In addition to these, the number of hills and ravines crossed are very great, inasmuch that the far greater proportion of the entire Road is either ascending or descending at four or five degrees, the latter being at the rate of 1 in about 11 1/2 or 460 feet per mile. To the view of the traveller upon this Road, therefore, as has been already remarked, the aspect of the country passed through would seem to deny the possibility of obtaining a graduation suitable for a Railroad of the description contemplated.

When, however, the object is a line suitable for a Canal or for a Railroad, the eye of science expands its view and embraces the widest field within the limits of practicability, and it is soon perceived that many of the formidable barriers encountered upon the turnpike road, have been rent asunder in the convulsions of nature, that stamp the great features of this portion of the earth's surface. After a little further investigation, it is found that all the mountain ridges, save one, have been severed, and that the gaps thus formed, afford so many passages for the streams that drain these high and humid regions, and that the rivers rising in, and flowing from, the single unbroken dividing ridge, the one eastward to the Potomac, and by it into the Chesapeake bay, and the other westward to the Monongahela, and by this stream into the Ohio river, are sufficiently direct, in their courses through these mountains, to afford one or more practicable routes for a Canal; should

there be found a sufficiency of water for its supply, not only at the highest level where the ridge dividing the eastern and western waters must be pierced by a tunnel, but likewise at all the inferior levels throughout the line. It is seen that the same routes are entirely practicable for a Railroad, even if there should be a lack of water for a canal; and that a shorter tunnel, if any, will be required for the Railroad. Dispensing with the condition of any but a small supply of water, other routes entirely impracticable for a Canal, will be altogether feasible for a Railroad. Hence, with a view to the latter improvement, the field of examination is much wider than for the former.

In point of fact, two routes have been pronounced by the U. S. Board of Internal Improvement, practicable for the Chesapeake and Ohio Canal; from Cumberland, to Turkeyfoot, (the junction of the Youghiogheny river, Casselman's river and Laurel hill creek—the one 98 miles 1040 yards in length, 2837 1/2 feet of lockage, and 1 mile 568 yards in length of tunnel; with a superincumbent ridge 233 feet high; the other 70 miles 1010 yards in length, 1961 feet of lockage, and 4 miles 80 yards in length of tunnel, with a superincumbent mountain 456 feet high above the tunnel level. The summit level of the one comprises a distance of 12 miles 1604 1/2 yards, of which 5 miles 832 yards are of deep cutting, (mostly in the glade of Deep Creek) beside the tunnel of 1 mile 568 yards just mentioned, whilst the summit level of the other, (by Will's creek and Flougherty) is in length 5 miles 1230 yards, of which beside the tunnel of 4 miles 80 yards, there are 1200 yards of deep cutting. In either case the summit level and many miles of Canal, with the numerous locks upon the same, are to be supplied with water mainly from stupendous reservoirs, to be erected and maintained in the Youghiogheny, or the Casselman's river and their tributaries. From Turkeyfoot the route of the Canal continued upon the right bank of the Youghiogheny river to the Monongahela, and thence to Pittsburgh.

Mention is here made of the route surveyed and reported for the Chesapeake and Ohio Canal, in order to show their adaptation to a railroad, and in pursuance of that design there are extracted and here given, a few more notes, observations, and statements, from the report of the U. S. Board of Internal Improvement, already mentioned.

(To be continued.)

**CURE FOR A CANCER.**—Mr. Thomas Tyrell, of Missouri, advertised that a cancer upon his nose, which had been treated without success by Dr. Smith, of New-Haven, and the ablest surgeons in the western country, had been cured in the following manner: He was recommended to use a strong potash, made of the ashes of red oak bark boiled down to the consistence of molasses, to cover the cancer with it, and in about an hour afterwards cover it with a plaster of tar, which must be removed after a few days, and if any protuberances remain in the wound apply more potash to them, and the plaster again, until they shall disappear, after which heal the wound with common salve. Caution and the knife had been previously used in vain. This treatment effected a speedy and perfect cure.—[Baltimore Farmer.]

**STRANDBOAT LOST.**—The steamboat Indian, arrived in Friday evening, reports the loss of the steamboat New Companion, Capt. Barlow, about fifty miles above the mouth of the Ohio River, in the Upper Mississippi.

Fig. 1.

[From the London Mechanics' Magazine.]

**BERGIN'S PATENT RAILWAY BUFFING-APPARATUS.**

We have more than once had occasion to mention the ingenious buffing-apparatus which Mr. Bergin, the intelligent Secretary of the Dublin and Kingstown Railway, has applied to the carriages under his superintendence, and the good effects which have resulted from its adoption. Our attention is again drawn to the merits of the invention by the Third Annual Report of the Board of Public Works in Ireland, now before us, in which we find it spoken of in the following favorable terms:—

"Thomas F. Bergin, Esq., Secretary to the Company, has applied to the carriages a spring-bar (for which he has obtained a patent,) admirably adapted to ease the shock of sudden stopping or putting in motion, while, at the same time, it is more strong, more simple, and much more economical, and attended with other great advantages, over the system hitherto adopted."

A description of the apparatus, furnished by Mr. Bergin, and illustrated by engravings, is annexed to the Commissioners' Report. We shall now transfer the former, with but little abridgement, to our pages; and so much, also, of the latter as is necessary to a clear understanding of the construction of the apparatus.

**MR. BERGIN'S DESCRIPTION.**

Immediately after commencing the traffic on the Liverpool and Manchester Railway (the first on which long trains of carriages were moved by locomotive-engines at high velocities), it was found that every time a train was put in motion or stopped, violent concussions took place between the several carriages, equally disagreeable to the passengers and destructive to the carriages themselves. These concussions arose from the following cause, viz. by reason of the inertia of all heavy bodies, the same engine-power which would be adequate to draw a given load along a railway at any required speed, would not be sufficient to start the same load from a state of rest; it was therefore necessary to connect the several carriages by chains of considerable length, say three or four feet, by which arrangement the inertia of the train was, as it were, divided into as many parts as there were car-

riages, and these several parts being each within the power of the engine, were overcome in succession; but as the first carriage would have attained a certain amount of velocity when the connecting chain came to pull the second, this second must of course be at once dragged from rest into motion at a speed nearly equal to that already acquired by the first, and so on through the entire train. Now a very slight knowledge of the principles of mechanics teaches that the concussions already mentioned were the necessary results of the action described; the same principle (inertia) produced the same effects at stopping a train, and also at every change in the relative velocities of the individual carriages when in motion; and as the force of these shocks was dependent on the velocities, the greater the speed of travelling the more violent they became.

The obvious remedy for the evil complained of was to provide a means by which the full amount of motion acquired by any part of the train should be gradually, not instantaneously, communicated to the other parts: the elasticity of a spring was a suitable means, and an apparatus was accordingly added to the Liverpool and Manchester passenger coaches, a sketch of which is annexed, and which has been termed a buffing-apparatus.

[Here follows a description of this apparatus]:—

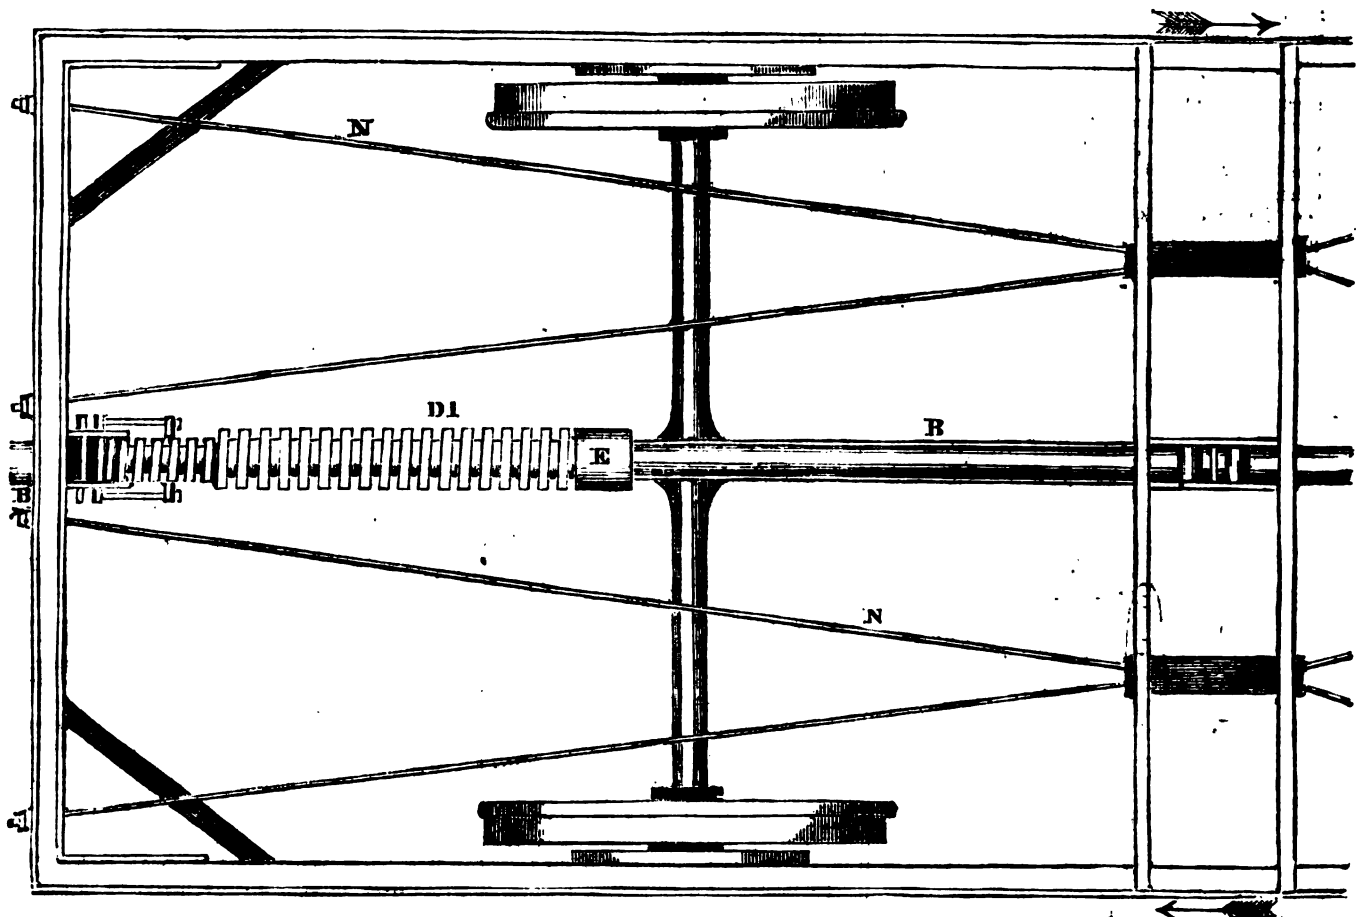

This apparatus is complex, and consequently expensive; it also requires to be very strong, as on a little consideration it will be evident that the spring-bars, levers, and frame of the first carriage have to bear the resistance of the entire train; a very rigid spring is therefore necessary, the range of action of which is, of course, very limited, (in practice not exceeding a few inches,) consequently the concussions, although much diminished, are still very considerable. The apparatus being attached to the carriage-frame, which is, of course, supported on bearing springs, it rises and falls according to the load; whence it constantly occurs, from the carriages being unequally weighted, that the buffer-heads, opposed to each other, and which by right should be at the same level, vary by nearly their own diameter. Whence, in the even

of a violent blow, the bars to which they are fastened are almost certain either to be bent so as not to play in their sockets, whereby the whole apparatus becomes inoperative; or else to be broken off (such we have found to be the case in every instance when an unusually severe blow took place.) After the apparatus described was added to the Liverpool and Manchester carriages, it was found that the train no longer proceeded with a steady motion in the direction of the rails, but that each carriage had acquired a very considerable lateral motion, by which the flanges of the wheels were constantly striking or rubbing against the rails, so as to cause a considerably increased resistance from side friction; indeed, on looking along a train of six or eight carriages, the serpentine motion is very striking. The cause of this unsteady motion will be evident, when we recollect that the point from which each carriage is drawn is in one direction, the centre, and in the other the after extremity. These considerations, the result of numerous careful examinations of the carriages on the Liverpool and Manchester Railway previous to ordering our own, led me to seek for a remedy; as on the Dublin and Kingstown Railway, so very large a proportion of the traffic of which would be passengers, the extent of which would be difficult to anticipate, but which must of necessity be immense, it became a matter of paramount importance to attain, as far as practicable, the most perfect comfort and security, and also to reduce, as much as possible, the wear and tear of the numerous carriages which the company must provide. The apparatus which I designed, and which has been successfully applied to thirty-five of our carriages, is represented in plan, section, and elevation in the accompanying drawings.\*

A slight frame of sheet-iron, AAA, consisting of two similar plates, three inches apart, each about 3-16ths thick, secured together by rivets, rests on turned bearings on the centres of the axles; a single bar,

\* We have given the section and plan only (our Figs. 1 and 2,) and have omitted the after-part of the carriage-frame in each, as it is an exact counterpart in every particular of the front part. We have also, for convenience sake, given detached views of the buffer-heads; Fig. 3 and 4, being a section and plan of them in the front, and Figs. 5 and 6, a section and plan of them in the rear.—Ed. M. M.

Fig. 2.

BB, (I have used a welded iron tube of 5-16ths inches thick, and three inches diameter, as being the stiffest,) the entire length of the carriage, and extending about two feet beyond each end, passing through an oblong hole three inches wide and nine inches long (H, 4), is supported on this frame by rollers, CCC, allowing it to be moved lengthways with great facility; on this tube or bar BBB is placed at either end (without the framing of the carriage) about four feet of spiral springs, DDD, of graduated strengths; one end of each of these sets of springs rests against a strong collar or boss, E, fixed to the bar or tube, and the other end against a small box of iron, F, attached to the frame A, and furnished with one of the rollers C previously mentioned; also with the two friction rollers G and G projecting a little beyond its surface, and resting against the inner side of the carriage-frame end. To each extremity of the tube BB is attached a buffer-head, I, by means of a bar of iron K, passing through BB, and furnished with a nut and screw at each end; immediately within the buffer-head, and resting against it, is a bar of iron, L, for attaching the carriages together. It will be observed, that this apparatus lying loosely on the axles, is perfectly independent of the frame-work of the carriage, which is supported in the usual manner on bearing springs, MM, and, in consequence of the oblong holes HH, rises or falls according to the load without affecting the buffering apparatus. The action of the apparatus is as follows:—The train being to be moved in the direction of the upper arrow, the motive power is applied to L 1, and draws forward the central tube BB, thereby compressing the springs DD between the boss E and the friction roller, box F, which rests

against the end of the carriage-frame, without moving this latter until the elastic force of the compressed springs becomes sufficient to overcome the resistance presented by the friction and inertia of the carriage, when the latter begins to move forward so gently as not to be perceptible to persons seated therein; the second and each succeeding carriage in the train is, by similar means, brought from a state of rest into motion, as (altogether independent of the springs DD,) the tube BB acts on B 2 merely as a simple connecting chain, rope, or bar, would. In case of a concussion from behind, or of one carriage running against another, it will be at once seen that the resistance is offered by the furthest end, the effect being to drive the tube BB forward, compressing the springs at the remote end; and the carriage will not be affected by the blow until (as in drawing the train) the elasticity communicated to the springs overpowers the inertia of the carriage, which then begins to move, actuated by a force just sufficient to start it; any ordinary velocity might be thus (theoretically) resisted by sufficient length of spring, without any strain or violence to the carriage receiving the blow; but practically, the springs are limited to about four feet, allowing a range of action of about two feet, beginning to be compressed by a force equal to about twenty pounds, and presenting a gross resistance to entire compression of upwards of two tons, and which have been found sufficient for all practical purposes. It will be observed, that as the springs of each carriage act totally independent of each other, and of all the carriages in the train, except to that to which they are attached, each has but to bear its own share of the resistance, the sum of which is made up of the separate resist-

ances of all the springs acted on: thus, if one set offers a resistance equal to two tons receding through two feet, and that there be ten carriages in the train, the gross resistance to a concussion would be equal to twenty tons through two feet; and if the buffer-heads of each carriage were in contact, this gross amount of resistance would be opposed without the carriages being necessarily moved forward, as in the case of any obstruction on the rails, or any of them bearing more than two tons. On the contrary, in the other apparatus, supposing each spring also to resist a force of two tons, and to recede, as in the case in practice, about eight inches, each spring being acted on by all that preceded it, the resistance offered by a train of ten carriages would be but equal to two tons through ten times the space each separate spring moved, or  $10 \times 8 = 80$  inches, or 6 feet 8 inches; consequently the first and each succeeding carriage would, to enable all the springs to act, be forced through a space equal to the sum of the spaces through which the separate springs act: thus the first carriage of the ten would be forced through eight inches for each of the remaining nine carriages, or in all six feet, and it is easy to conceive the difference of the effect in the two cases. Experiments have been tried on this railway, by placing a single carriage, fitted with the new apparatus, on the rails, and running an engine and tender against it with a velocity of six to seven miles an hour, without producing any injurious effect, and have more than once sat in a carriage so struck, without sustaining any injury or other effect greater than is felt on starting a train of carriages fitted with the old apparatus.

Another effect which has been realized by the adoption of this apparatus is a per-

fectly steady forward motion in the trains, whereby very much of the side friction of the flanges of the wheels against the rails is avoided; and instead of that undulating lateral motion previously described, all the carriages constituting the train move forward in a steady path, as if they had not the power of motion independent of each other. Carriages are hereby rendered much less liable to go off the rails, and can be pushed before the engine in case of necessity with far greater confidence and less lia-

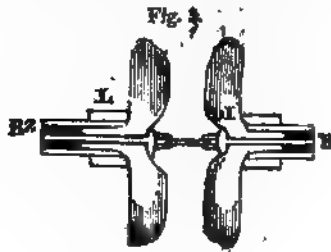

Fig. 3.

Fig. 6.

bility to accident; as although the impulse is given to the central bar from behind, yet it is obvious the carriage is acted upon from the front, precisely as it would be if drawn in the same direction. I have frequently, during our experimental trials before opening the railway, propelled one and two carriages in this manner at a velocity of thirty miles per hour with perfect safety. The diminution of side friction necessarily diminishes the power requisite to draw a train; the amount of saving in this respect I have as yet been unable to ascertain experimentally with sufficient accuracy to state in this place; I have, however, ascertained that it is very considerable.

One other object, of no trifling importance

to a concern like the Dublin and Kingstown Railway, which must have an exceedingly large stock of carriages, is also effected; namely, a diminution of first cost of between 50L and 60L per carriage.

In describing the figures, I omitted to state that as the entire resistance to the action of the springs D D is on the ends of the carriage-frame, the centre of each is armed with a strong plate of iron, about fifteen inches square, through which pass the tension rods N N to the outer angles of the opposite ends of the frame; consequently these rods receive the entire force of the springs.

NATCHEZ, (Miss.) Dec. 10.

**Burning of the Walk-in-the-Water.**—The steam boat Walk-in-the-Water was discovered to be on fire on Tuesday evening between 8 and 9 o'clock. From the great volume of flame which burst from her almost immediately after the alarm, it is presumable that she had been on fire under the deck for a considerable period. An effort was made to save the cabin furniture, but the rapidity of the fire was such, that the attempt was abandoned. The clerk's office was locked, and himself absent. One or two individuals tried to break it open without success. The books, papers, about 1200 bales of cotton, and \$3500 in money, were burnt. The cotton was all insured, either here or at New Orleans.

The Walk in the Water was lying opposite the warehouse of Robert Mitchell & Co., and A. L. Wilson, inside of the Charleston, which latter boat was cut loose and towed up outside of the flat boats. The stern line of the Walk in the Water was then cut, and by the action of the eddy, her stern swung round against the stern of the Charleston, setting her on fire the second time. The Charleston was then sent adrift with her upper works in a blaze, and with but three individuals on board, to wit: the captain, mate, and one of our citizens, Mr. Wm. Woods. To these individuals much credit is due for saving the boat. While the people on the wharf were sending boats out to rescue them, not expecting that the Charleston could be preserved, by the extraordinary exertions of these individuals the fire was got under, and with the assistance of those sent to take them off, was finally extinguished. Steam was then raised, and she was again brought up to the landing, having floated down one or two miles. In the mean time the Walk in the Water was a mass of flames, producing a bright glare for miles around her. To save the warehouses and stores within danger, she had also been cast adrift, and as she floated in the midst of the waters, was a magnificent sight.

The sides of the bluff were brightly illuminated, and the distant shore of Louisiana was traced as with a pencil dipped in gold; while the long line of smoke, which rose but a little above the bluff, and floated northward over the bed of the river, looked bright in contrast with the surrounding gloom; and as the unruffled surface of the water reflected back, with increased vividness, the burning mass, it presented a scene worthy of the painter.

A boat which was chained between the two decks, was burnt, and it is supposed that a human being also suffered.

A white man was seen, after the Walk-in-the-Water was cut adrift, at the stern of the boat, apparently in search of some object. He was hailed, and advised to come ashore. He replied; but all he said was not heard. He was understood so say, that he would not leave the boat until he found that for which he was in search. Report states, he was afterwards seen to fall, by the giving way of the deck, into the hold.

The bear being chained about midway of the upper deck, excited strongly the sympathies of the spectators. As the flames rose they were drawn between the decks, and met over the bear—as they shot upwards, first upon one side and then upon the other, he would leap in the contrary direction to escape, and would as often be opposed by a wall of fire. He finally made one desperate effort and cleared the deck, but did not break his chain. He attempted to raise himself by grasping his chain above, but he was soon suffocated.

The boat belonged to Captains Crain and Glover, who had just purchased her, and we have not learned whether she was insured or not.

The boat continued burning until this morning,

when she sunk about four miles below, near the Louisiana side. She was of the largest class of boats, and the loss of boat and cargo, is estimated at \$110,000.—[Courier.]

**STEAMBOAT ACCIDENT.**—On Tuesday evening the steamboat Levant, on laying the landing, came in contact with the steamboat Marion that was just coming in. The concussion was so great that the bows of the Marion were move in, and in a short time she sunk. The Levant was speedy in rendering assistance, and with the prompt aid of Captains E. Strong, Ackerman, of the ship Byron, and the officers of the ship Star, Southerner, Nashville, and others in the neighborhood, a fast was got hold of the Marion, and she was hauled into the Levee. Her cargo, consisting of sugar, molasses and cotton, however, will be a loss. It is much feared that some of the passengers or hands are lost.

**MOST MELANCHOLY ACCIDENT.**—The Eastern Whig of the 26th contains an account of the loss of the schooner Hester Ann, of Wye River, which sailed from Baltimore for the Eastern shore on the 15 instant. She had on board, as passengers, several of the most respectable and worthy citizens of Talbot county, all of whom, as well as the crew, making ten or twelve in the whole, have met with a watery grave. We annex the melancholy particulars, as far as they had become known.

EASTON, Dec. 26.

When we laid down our pen on concluding the lamentable occurrence which we published in our paper of Tuesday last, giving the melancholy fate of Mr. JAMES G. ELLIOTT, and the loss of the schooner Hester Ann of Wye River, we entertained the hope that we should not have to resume it to give other particulars, or be pained to record further loss of lives. We now have to add, that from the circumstances related to us by gentlemen from the wreck, beyond a doubt all of the passengers and crew are lost; supposed to be ten or twelve in number.

Capt. Marshall left Baltimore on last Tuesday week in the steamboat Maryland for Easton, entrusting to his cousin (Mr. James Marshall) the command of the Schooner, which sailed on the same morning for Wye river. Our informant and Capt. Marshall both conversed with the passengers on the Monday night previous to their sailing, and in corroboration of the fact of their being on board the Hester Ann, Capt. Benny of the Easton Packet, actually recognized and conversed with them just before they parted company on the night of the accident.

The following are the individuals lost: James G. Elliott, John P. Pace, jr., Richard Baker, John Redman, James Marshall, and three colored men. It is also supposed there were several colored passengers on board.

Capt. Marshall, with several other gentlemen, reached the wreck on Tuesday morning last, and succeeded in getting out of her some freight; the trunks, and some wearing apparel of the unhappy sufferers, but found none of their bodies; those of Mr. Elliott and the colored man (named Aaron Smyler) having been previously taken off by some of the people of Poplar Island. The schooner was found a perfect wreck, nearly under water, having bulged, it is supposed, after she capsize; the mainmast was carried away, and her anchor cast out; consequently they labored under much difficulty in searching the cabin; but from the circumstance of finding boots and shoes belonging to the sufferers, it is inferred they were below when the accident happened, probably abed. There was a large quantity of freight on board, principally owned by Mr. Pace, but so much injured as to render it unworthy of taking from the wreck. She was hauled ashore on Poplar Island and sold. Mr. Elliott's body has been carried to the residence of his family, where it will be interred.

**DREADFUL EARTHQUAKE.**—The Journal of Odessa describes the ravages of a dreadful earthquake, which occurred on the 25th of August at Kaisariach, (the ancient Caserma in Cappadocia,) and the surrounding villages. On that day, about 5 in the afternoon, a thick column of smoke was seen to arise at the foot of Mount Arfeschah, (on the side of which the town is situated,) from which volumes of flame burst forth with an appalling noise. At the same moment the shocks of an earthquake began, and continued for several hours, accompanied by a noise like thunder. Those who survived the effects, describe their sensation as if they had been

on the surface of an ocean agitated by a storm. About 2000 houses were destroyed in that city. All the inhabitants that could effect their escape, fled into the country, but about 150 perished in the falling ruins. Up to the 1st September the surviving inhabitants were still in the fields, afraid to return to the city; and during that time three or four shocks were felt every day, but becoming gradually weaker. The destruction in the villages, to the distance of 140 miles, was terrific. Some were swallowed up; and the place of one of them, Kermetz, was occupied by a large lake. The number of lives lost has not yet been ascertained, but it appears to have been very great.

**FEW THINGS IMPOSSIBLE.**—"It is impossible," said some, when Peter the great determined to set out on a voyage of discovery, through the cold northern regions of Siberia, and over immense deserts; but Peter was not discouraged, and the thing was done.

"It is impossible," said many, when they heard of a scheme of good Oberlin's. To benefit his people, he had determined to open a communication with the high road to Strasburg, so that the productions of de la Roche (his own village,) might find a market. Rocks were to be blasted, and conveyed to the banks of the river Bruche, in sufficient quantity to build a wall for a road along its banks, a mile and a half, and a bridge across it. He reasoned with his people, but still they thought it was impossible; but he seized a pickaxe, put it across his shoulder, proceeded to the spot, and went to work, and the peasants soon followed him with their tools. The road and bridge were at length built, and to this day, the bridge bears the name of the "Bridge of Charity."

"It is impossible," said some, as they looked at the impenetrable forests which covered the rugged flanks and deep gorges of Mount Pilatus in Switzerland, and hearkened to the daring plan of a man named Rupp, to convey the pines from the top of the mountain to the Lake of Lucerne, a distance of nine miles. Without being discouraged by their exclamations, he formed a slide or trough of 24,000 pine trees, 6 feet broad, and from 4 to 6 feet deep; and this slide, which was contemplated in 1812, was kept moist. Its length was 44,000 English feet. It had been conducted over rocks, or along their sides, or over deep gorges where it was sustained by scaffolds; and yet skill and perseverance overcame every obstacle, and the thing was done. The trees slid down from the mountain into the lake with wonderful rapidity. The large pines, which were one hundred feet long, ran through the space of eight miles and a third in about six minutes.

A gentleman who saw this great work, says:—"Such was the speed with which a tree of the largest size passed any given point, that he could only strike it once with a stick as it rushed by, however quickly he attempted to repeat the blows."

Say not hastily, then, of any thing, "It is impossible." It may not be done in an hour, or a day, or a week; but perseverance will finally bring you to the end of it. "Time and patience," says a Spanish proverb, "will turn a mulberry leaf into silk."

[From the Jersey City Gazette.]

**TRIAL FOR FORGERY.**—Previous to the late fire in New-York, we had prepared for publication a statement of the following case, the copy for which was destroyed on that occasion; and the consequent derangement of our office has prevented an earlier attention to the subject on our part.

On the 8th of December last, before the Court of General Sessions for the City and County of New-York, the Recorder and Aldermen Taylor and Labagh presiding, NATHANIEL FREEMAN, of Aharsimus, was tried on an indictment for forgery in the third degree, in counterfeiting the signature of Arthur Tappan & Co., of New-York, to a note addressed to John Rankin, also of that city, requesting the loan of ten or twelve hundred dollars, with intent to defraud said Rankin thereof.

The District Attorney, for the prosecution, called Messrs. Lewis Tappan and John Rankin, who proved the forgery.

N. Nye Hall, of counsel for the defence, entered a plea of insanity, and called a great number of witnesses to sustain the plea; the most important of which were,

Mrs. Mary Hall, a highly respectable lady of 70 years of age, who had for a considerable time resided in the family of the accused, and had been acquainted with him from infancy. This witness testified that she had no doubt that Freeman was occasionally insane; and that she had the best reason for believing that the malady was hereditary, both his father and his mother having been subject to occasional fits of mental alienation.

Simon Healy had known the accused long and familiarly; had for some time past considered him partially deranged. A few months previous, Freeman had told witness that he felt a disposition to blow his own brains out; that he was frequently subject to a depression of spirits, which tempted him to commit suicide.

Col. Samuel L. Knapp had known Freeman many years, both in New-York and Boston; and from his universal uprightness of character and honorable conduct, believed it impossible that he should commit such an act as that charged in the indictment, unless laboring under an aberration of mind.

Gen. Robert Swartwout, Dr. J. D. Garner, and many other highly respectable witnesses, gave similar evidence; and all testified to the good character and integrity of demeanor of the prisoner, previously to the commission of the act for which he was now on trial; and were unanimous in the belief that he was subject to occasional fits of hallucination, especially on subjects connected with religion and the abolition of slavery, to the latter of which subjects allusion was made in the note for the writing of which he was now on trial.

So full and clear was the evidence to the fact of insanity, that the Jury, in reply to a question from the Recorder, whether they

were satisfied of that fact, rendered an immediate verdict of acquittal, without leaving their seats.

The verdict was received with great and unfeigned satisfaction, by the numerous friends of the accused, whom the occasion had called together, and in company of whom he left the court.

We are sincerely happy at this clear and impartial decision of an affair which had caused a deep and melancholy sensation in the minds of the highly respectable circle in which Mr. F. and his amiable family had moved.—[Jersey City Gazette.]

**MORRIS RAILROAD CONTINUED.**—An application will be made to the Legislature, at its next sitting, for a law authorising the construction of a Railroad from Morristown, by the most eligible route, through Sussex and Warren counties, to the Delaware River, at or near the Water Gap.

The Belvidere Apollo states, that the bridge over the Delaware, at that place, is now completed, and ready for the passage of any description of vehicles, at a very reasonable toll.

A writer in the Sussex Register recommends the construction of a railroad through that county, from the coal region on their west, to the Hudson River at New-York.

**BANK OF NEW-BRUNSWICK.**—The N. Y. Commercial Advertiser says:—"It is understood that bills of this Bank, amounting to about \$20,000, put in circulation previous to its bankruptcy the 19th February, 1834, have never been redeemed by the Bank, or presented to the receivers, and that many of them are now offered for sale. The public are cautioned not to receive these bills, as the time limited to the creditors of the Bank expired on the 4th of May last, and the bills in the hands of persons who may now receive them, will be entirely worthless."

**COUNTERFEITS.**—Counterfeit five dollar notes of the Bank of New-Brunswick, says the New-York Mercantile, with fictitious signatures, and evidently filled up with the same hand, are in circulation. The plate is a genuine one, and was probably stolen from the Bank, when it was robbed some time since.

**SUDDEN DEATHS.**—The Morris papers mention the sudden death of Mrs. Phoebe Schenck. She was found dead in a sitting posture, leaning against a post of the piazza, on Monday afternoon, though she had enjoyed usual health, and was engaged in her domestic duties during the day. An affection of the heart is one of the conjectured causes.

The wife of John Walter, of German Valley, it is also stated, dropped dead on Tuesday. She had been long afflicted with dropsy in the chest.

## AGRICULTURE, &amp;c.

From the Farmers' Register.

## ON THE USE OF LIME AS A MANURE.

By M. PUVIS.

Translated for the Farmers' Register from the *Annales de l'Agriculture Française*, of 1836.

The publication of the following communication to the *Annales de l'Agriculture Française*, was commenced in the February No. of that journal, (which was received here in May,) and the June No. contains the end of the first part, "On Liming," and enables us to offer the translation of that portion to our readers. Only a few pages of the next portion of the series, "On Marling," has yet appeared, and not enough to permit a judgment to be formed of its worth.

Though there are many deficiencies in this treatise on liming—and also opinions as to the theory of the action of lime, in which we cannot coincide—still, on the whole, we consider it as presenting far more correct views, and more satisfactory information, both on theory and practice, than any other work on liming that we have before seen. In other points, and those of most importance, the facts here presented, (and now first learned from any European authority,) strongly sustain the views maintained in the *Essay on Calcareous Manures*. It would be both unnecessary and obtrusive to remind the reader of these points of difference, and of agreement, whenever passages exhibiting either may occur. They will, therefore, generally be submitted in the author's words, without comment. A few exceptions only to this rule will be made, in cases which appear particularly to call for them.

We have no information whatever of M. Puvis, the author of this treatise, previous to the appearance of the commencement of the publication in the *Annales*. But he is evidently well informed on his subject, and is stated by the introductory remarks of the French editor, to be entitled to all respect, for his long experience, and his practical, as well as scientific investigation of the subject. If, then, there remains no ground to distrust his judgment, or his facts, the statements made are most important to a very large portion of this country, which has heretofore been generally supposed to be deprived of all possible benefit from the use of calcareous manures, on account of their remoteness and high price of carriage. M. Puvis states that the most successful and profitable liming in Europe (for the expense incurred) is in repeated applications of very small dressings—making less, on the average, than four bushels of lime to the acre, annually. This small amount, if nearly as efficacious as is alleged, would cost so little in labor and money, that the limits of the region capable of being limed may be very far extended. It would not matter though the applications should require to be repeated forever, provided the annual returns gave good profit upon the annual expenses; and far greater will be the profit, if (as we think) the soil ultimately, will no longer require such repetitions—or only at very distant intervals of time—and still be a highly productive, because it has been made a calcareous and fertile soil.—[Ed. Farm. Reg.]

## On the Different Modes of Improving the Soil.

To improve the soil is to modify its composition in such manner as to render it more fertile.

This definition, which might be extended to manures charged with vegetable

mould [*humus*] or animal substances, which also modify the composition of the soil, is limited by French agriculture to substances which act upon the soil, or upon plants, without containing any notable proportion of animal or vegetable matter.

It is said that manures, [putrescent or enriching,] serve for the nutriment of plants. But it is the same as to substances improving to the soil, which furnish to it matters which it needs to be fruitful, and which furnish to vegetables, the earth and saline compounds which enter as essential elements in their composition, their texture and their products. Such improving substances ought well to be regarded as nutritive.\*

Thus lime, marl, and all the calcareous compounds employed in agriculture, since they furnish lime and its compounds, which sometimes form half of the fixed principles of vegetables, ought also to be considered as aliments; or, what comes to the same, as furnishing a part of the substance of vegetables. Thus again, wood-ashes, pounded bones, burnt bones, which furnish to vegetation the calcareous and saline phosphates which compose a sixth of the fixed principles of the stalks, and three-fourths of their seeds, ought well to be considered, and surely are, nutritive.

What then particularly marks the distinction between manures which improve the soil [*amendemens*] and alimentary manures, [*engrais*] is, that the former furnish, for the greater part, the fixed principles of vegetables, the earths, and salts, which are abundantly diffused throughout the atmosphere, whence vegetables draw them, by means of suitable organs: and what is most remarkable, is, that the vegetable, by receiving the fixed principles of which it has need, acquires, as we shall see, a greater energy to gather for its sustenance the volatile principles which the atmosphere contains.

The greater part then of soils, to be carried to the highest rate of productiveness, require manures to improve their constitution. Alimentary manures give much vigor to the leafy products—but they multiply weeds, both by favoring their growth, and conveying their seeds—and they often cause crops of [small grain] to be lodged, when they are heavy. Manures which improve the soil, more particularly aid the formation of the seeds, give more solidity to the stalks, and prevent the falling of the plants. But it is in the simultaneous employment of these two means of fertilization by which we give to the soil all the active power of which it is susceptible. They are necessary to each other, doubling their action reciprocally; and whenever they are employed together, fertility goes on without ceasing—increasing, instead of diminishing.

The greater part of improving substan-

\* The two classes of manures which are described generally above, are conveniently designated in French each by a single word. "*Engrais*," which we can only translate as manure, is limited in significance to such substances as directly enrich soils, and feed growing plants—and "*amendemens*," signifying substances which alter and improve the constitution, texture, and indirectly, the fertility of soil, but the operation of which is not to furnish food to plants. In speaking of the action of these different classes, the sense may be rendered, though not very precisely, by the words "enrich," and "improve"—but there is no one English term that will convey the meaning of either class of substances. "Alimentary manures" will be used for the first class, and "manures improving the constitution of soil," or some similar awkward, but descriptive phrase, can only render the meaning of the word "*amendemens*"—useless "improvers" could be tolerated as a substitute, for convenience. Tt.

ces are calcareous compounds. Their effect is decided upon all soils which do not contain lime, and we shall see that three-fourths, perhaps, of the lands of France are in that state. The soils not calcareous, whatever may be their culture, and whatever may be the quantity of manure lavished on them, are not suitable for all products—are often cold and moist, and are covered with seeds. Calcareous manures, by giving the lime which is wanting in such soils, complete their advantages, render the tillage more easy, destroy the weeds, and fit the soil for all products.

The improving substances have been called *stimulants*; they have been thus designated because it was believed that their effect consisted only in stimulating the soil and the plants. This designation is faulty, because it would place these substances in a false point of view. It would make it seem that they brought nothing to the soil, nor to plants—and yet their principal effect is to give both principles which are wanting. Thus the main effect of calcareous manures proceeds from their giving, on the one hand, to the soil the calcareous principle which it does not contain, and which is necessary, to develop its full action on the atmosphere—and on the other hand, to vegetables, the quantity which they require of this principle, for their frame work and their intimate constitution. It would then be a better definition than that above, to say that to improve the soil is to give to it the principles which it requires, and does not contain.

## Importance of Manures which improve the Constitution of Soils.

The question of improving manures is of great interest to agriculture. This means of meliorating the soil is too little known, and above all, too little practised in a great part of France—and yet it is a condition absolutely necessary to the agricultural prosperity of a country. In the neighborhood of great cities, alimentary manures being furnished on good terms, may well vivify the soil; but animal manures cannot suffice but in a few situations, and of small extent—and in every country where tillage is highly prosperous, improving manures are in use. The Department of the North (of France) Belgium, and England owe to them, in a great measure, their prosperity. The Department of the North, (which is, of all Europe, the country where agriculture is best practised, and the most productive,) spends every year, upon two thirds of its soil, a million of francs in lime, marl, ashes of peat and of dead coal, [*houille*]\* and it is principally to these agents, and not to the quality of the soil, that the superiority of its production is owing. The best of its soil makes part of the same basin, is of the same formation, and same quality, as a great part of Artois and Picardy, of which the products are scarcely equal to half the rate of the North. Neither is it the quantity of meadow land which causes its superiority; that makes but the fifth part of its extent, and Lille, the best *Arrondissement*, has scarcely a twentieth of its surface in meadow, while Avesne, the worst of all, has one-third. Nor can any great additional value be attributed to the artificial meadows, since they are not met with except in the twenty-sixth part of the whole space. Neither can this honor be due to the suppression of naked fallows, since in this country of pattern husbandry, they yet take up one-sixth of the ploughed land,

\* Statistique du département du Nord. J

every year. Finally, the Flemings have but one head of large cattle for every two hectares\* of land, a proportion exceeded in a great part of France. Their great products then are due to their excellent economy and use of manures, to the assiduous labor of the farmers, to courses of crops well arranged, but above all, we think, to the improvers of soil, which they join to their alimentary manures. Two thirds of their land receive these regularly: and it is to the reciprocal action of these agents of melioration, that appears to be due the uninterrupted succession of fecundity, which astonishes all those who are not accustomed continually to see the products of this region.

At this moment, upon all points in France, agriculture, after the example of the other arts of industry, is bringing forth improvements; in all parts especially, cultivators are trying, or wishing to try, lime, marl, ashes, animal black. It is this particular point in progress, above all, for which light is wanting; and this opinion has induced the preparation of this publication. Since more than thirty years, the author has devoted himself, from inclination, to agriculture; but he has been especially attentive to calcareous manures. He has studied in the practice of much extent of country, in his own particularly, in personal experiments, and in what has been written on them both by foreigners and countrymen. An *Essay on Marl* has been the first fruit of his labors; an *Essay on the use of Lime* will soon be ready: it is with these materials that he now sets himself to work. To prepare for this object, a series of articles, of the nature of a recapitulation rather than of a regular work, it was necessary to be concise, and yet not to omit any thing essential. It is proper then that he should limit himself to the prominent parts of his subject, those especially useful to practice. His advice will then be as often empirical as regular, and his directions will be precise, although supported by few developements.

An extract from this work has appeared in the *Encyclopedie Agricole*: here it will again appear, but by separate articles, which will be corrected by a systematic general view of theory, founded on practice. This is the moment for multiplying publications on this subject, because that in almost all parts of France, it is the point in agriculture most controverted,—that which induces the most labor and the greatest expenditures—which presents most doubts—and which has consequently most need of being made clear.

We shall not enlarge here upon the manner in which improving manures act: we will put off this important question, with its developements to the article on lime. Here we only present the theory. Hereafter, that which we will hazard will be founded upon facts, and yet we will not promise these developements, but for the purpose of enlightening and directing practice.

\* The hectare is very nearly equal to two and a half English (or American) acres. See account of French Weights and Measures, p. 506. Vol. II. Farm. Reg.—Tx.

† *Essai sur la marne*, published 1826, at Paris. This is the first notice which we have had of the existence of this work, and have forthwith sent for a copy, as well as for one of the author's forthcoming *Essay on the use of Lime*, that no source of information on this important subject may be excluded. But it may be inferred (from the author's expressions) that these more extended works will contain nothing more of what is essential, than is presented in this condensed form, prepared by himself for the *Annales*. Ep. FAR. Bxo.

#### Of the various kinds of Improving Manures.

The first in order, and the most important, are the calcareous manures. We comprehend under this name, lime, marl, old plastering mortar, and other rubbish of demolished buildings, beds of fossil shells, [*falsen*]\* or shelly substances, plaster or gypsum: experience and reason will prove that we ought to arrange in the same class, and by side of the others, wood ashes, ground bones, and burnt bones. We will not place in the same list the ashes of peat, of dead coal, and red pyrotous ashes: their effect is not owing to their lime, but (as will be seen afterwards,) rather to the effect of fire upon the earthy parts, and particularly upon the argil which they contain.

We will next in order treat of manures of the sea, or saline manure of different kinds, of mixtures of earth, of calcined clay: and finally, of paring and burning the turf, and the different questions which peat presents in agriculture.

#### Of Liming—On the Use of Lime for the Improvement of Soil.

1. Among the immense variety of substances, and of combinations which compose the upper layers of the globe, the earthy substances, silex, alumine, and lime, form almost exclusively the surface soil: the greater portion of other substances being unfit to aid vegetation, they ought to be very rare upon a surface where the Supreme Author willed to call forth and to preserve the millions of species of beings of all nature, which were to live on its products.

It was also a great benefit to man, whose intelligence was to be exercised upon the surface of the soil, to have so few in number the substances proper to support vegetation. The art of agriculture, already so complex, which receives from so many circumstances such diverse modifications, if there had been added new elements much more complicated, would have been above the reach of human intelligence.

2. But among these substance, the two first, silex and alumine, form almost exclusively three-fourths of soils; the third, the carbonate of lime, is found more or less mixed in the other fourth: all soils in which the latter earth is found, have similar characters, producing certain families of vegetables which cannot succeed in those in which it is not contained.

The calcareous element seems to be in the soil a means and a principle of friability. Soils which contain calcareous earth in suitable proportions, suffer but little from moisture, and let pass easily, to the lower beds, the superabundance of water, and consequently drain themselves with facility. Grain and leguminous crops, the oleaginous plants, and the greater part of the vegetables of commerce, succeed well on these soils.

It is among these soils, that almost all good lands are found. Nevertheless, the abundance of the calcareous principle is more often injurious than useful. Thus it is among soils composed principally of carbonate of lime that we meet with the most arid and barren, as Lousy Champagne, part of Yonne, and some parts of Berry.

3. The analysis of the best soils has shown that they rarely contain beyond 10

\* *Falsen*.—Beds formed by shells. There is one of these immense beds in Touraine. The cultivators of that country use this shelly earth to improve their fields. This definition is from Rozier's *Cours Complet*, and though it clearly shows that the substance in question is the same as what is called "marl" in Virginia, it is equally clear that neither of these authors consider *falsen* as being marl. Tx.

per cent. of carbonate of lime; and those of the highest grade of quality seem to contain but from 8 to 5 per cent. Thus the analysis of Messrs. Berthier and Drapiez, show 3 per cent. of it in the celebrated soil of the environs of Lille.

4. But all these properties, all these advantages, all these products, calcareous manures bear with them to the soils which do not contain the calcareous principle. It is sufficient to spread them in very small proportions: a quantity of lime which does not exceed the thousandth part of the tilled surface layer of the soil, a like proportion of drawn ashes, or a two-hundredth part (or even less) of marl, are sufficient to modify the nature, change the products, and increase by one-half the crops of a soil destitute of the calcareous principle. This principle, then, is necessary to be furnished to those soils which do not contain it; it is then a kind of condiment disposed by nature to meliorate poor soils, and to give to them fertility.

#### Ancient Date of the Use of Lime.

5. Lime, as it appears, has long ago been used in many countries. However, nothing proves that its effect was well known to the Greeks and Romans, the then civilized portion of mankind. Their old agricultural writers do not speak of the use of lime on cultivated lands, nor on meadows. Pliny, the naturalist, tells us, however, that it was in use for vines, for olives, and for cherry trees, the fruit of which it made more forward: and he speaks of its being used on the soil generally in two provinces of Gaul, those of the Pictones and Edui,\* whose fields lime rendered more fruitful. The agriculture of the barbarians was then, in this particular, more advanced than that of the Romans. After that, all trace of the use of lime in agriculture, is lost for a long time—whether that it had ceased to be used, or only that the notice of it was omitted by writers on agriculture. The trace is again recovered with Bernard Pellissay, who recommends the use of it in compost in moist lands, and speaks of his use of it in the Ardennes. Nearly a century later, Olivier de Serres,† advises its employment in the same manner, and reports that they made use of it in the provinces of Gueldres and Juliers [in Belgium]. He makes no mention of its use in France: but as the practices of agriculture were not then much brought together, and were but little known, it may be believed that at that time, Flanders, Belgium, and Normandy, made use of lime.

In England, liming seems to have been in use earlier and more generally than in France. But then, and in all time since, good agricultural practices have remained in the particular countries where they were established, without being spread abroad. Now, novelties carry no alarm with them—and in the last twenty years, liming has made more progress than in the two preceding centuries.

#### Of Soils suitable for Liming.

6. Lime, as has been said before, suits the soils which do not contain it already. To distinguish these soils from others, chemical analysis is, without doubt, the surest means; but it offers often too many difficulties, and lime may be met with in a soil in proportion great enough to exert its power on vegetation, without producing ef-

\* *Edui et Pictones calce sberminos fecere agros.*

† Who wrote on agriculture in the reign of Henry IV. of France. Tx.

ferreousness with acids.\* But visible characters may furnish indications almost certain. The soils where the cow wheat, [*melampyre*], rest-harrow, [*l'onomis, ou arret-eauf*], thistles, colt's foot, [*tussilage*], and red poppy, spring spontaneously—which produce well in wheat, legumes, (or plants of the pea kind), and especially sainfoin—where the chestnut succeeds badly—which shows but little of dog's-tooth, [*chiendent*], volunteer grasses, or common weeds, [*graminées adventices*], except of the small leguminous kinds—soils which, after being dry, crumble with the first rain—all these are almost certainly calcareous, have no need of lime, nor its compounds, and would feel from their use, rather ill than good effects.

On the contrary, all soils composed of the moulderings [*debris*] of granite or schistus, almost all sandy soils, those which are moist and cold of the immense argilo-silicious table lands [*plateaux argilo-silicieux*] which separate the basins of great rivers; [*petit ajonc*] the heath, *les petits carex blancs*, the whitish moss spring spontaneously—almost all the soils infested with *avoine a chapelets*, with dog's-tooth, with bent grass [*agrostis*], red sorrel, and the little feverfew—that soil where, unless so clayey as to offer great difficulty to cultivation, only rye, potatoes, and buckwheat, can be made, and where sainfoin and the greater part of the crops of commerce cannot succeed—where, however, trees of all kinds, and especially the resinous kinds, the wood-pine, the sea pine, the larch, the northern pine, and the chestnut, thrive better than in the best land—all these soils are without the calcareous principle, and all the improving manures in which it is found, would give to these the qualities of, and nourish the growths peculiar to calcareous soils.

But there, more than elsewhere, it is especially necessary to avoid too much haste. Liming upon a great scale, ought not to be done, until after having succeeded in small

\* This is a full though indirect admission of the truth of the doctrine of *neutral soils*, maintained in the *Essay on Calcareous Manures*. Tz.

† Though both the truth and the usefulness of this passage, in general, are admitted, yet it is incorrect in the position that none of the "compounds of lime" would be advantageously employed on calcareous soils. On the contrary, the sulphate of lime (gypsum), the most important compound as a manure, next to the carbonate, is most effective where the land has lime in some other form: and indeed, (as has been maintained elsewhere,) it seems generally inert and useless on soils very deficient in lime.—*Essay on Calcareous Manures*, pp. 50, 92.]

‡ The character of the lands called by the author "*plateaux argilo-silicieux*," and which he refers to frequently in the course of his essay, can only be gathered from the context. They are poor, intractable under tillage, and but little pervious to water. The name indicates their composition to be silicious and aluminous earth almost entirely. It may be inferred that such lands resemble in soil the elevated level ridges, which in lower Virginia separate different water courses, and especially those which, in addition to being miserably poor, are remarkably close, stiff, and "water holding"—and are in some places called "cold liver land," "pipe-clay," or "cray-fish" soils. Soil of this kind, and of the most marked character, is particularly described at page 40, *Essay on Calcareous Manures*, 2d ed. M. Puvion elsewhere speaks of this "argilo-silicieux" soil as being found every where in France, and as known in different places under the various names of "terrian blanc," "blanche terre," in the south, "boulbenne," in the north, of "terre clytre," and "terre a bois"—and the basin of the Loire, "terre de Sologne." The last name would direct us to the lands of Sologne, which furnish it, as it may be presumed, as being of like quality. Arthur Young says, "Sologne is one of the poorest and most unimproved provinces of the kingdom, and one of the most singular countries I have seen. It is flat, consisting of a poor sand or gravel, everywhere on a clay or marl bottom, retentive of water to such a degree that every ditch and hole was full of it." Tz.

experiments on many different parts of the ground designed to be improved.

#### Extent of Surface to which Lime is suitable.

7. A great proportion of the soil of France does not contain the calcareous principle. The country of primitive formation—the mountains of which the rock is not calcareous—many soils even, of which the sub-soils inclose calcareous formations—the great and last alluvion which has covered the surface, and which still composes it wherever the return waters have not carried it off with them—also extensive surfaces, in the composition of which the calcareous principle had not entered but in small proportions, and which small amount has been used by the successions of vegetation—all these kinds of soil, which compose at least three-fourths of the surface of France, to be fertilized, demand calcareous manures. If it is admitted that one-third of all this space has already received aid from lime, marl, ashes of wood, or of peat, of bones burnt, or pounded, there will still remain the half of France to be improved by such means: an immense task, doubtless—but of which the results will be still more prodigious, since it will cause the products of all this great space to be increased by one-half, or more.

#### Of the various Modes of Applying Lime to the Soil.

8. Three principal procedures are in usage for applying lime. The first is the most simple, and is the most general wherever lime is obtained cheaply, and where culture is but little advanced in perfection, and hand labor is dear. This consists in putting the lime (the burned limestone) immediately on the ground in little heaps at 20 feet average distance, and each heap containing, according to the rate of limiting, between a cubic foot of the stone, to half that quantity. When the lime has been slaked by exposure to the air, and has fallen into powder, it is spread over the surface, so as to be equally divided.

9. The second mode differs from the first in this respect: the heaps of stone are covered with a coat of earth, about six inches thick, according to the size of the heap, and which is equal to five or six times the bulk of the lime. When the lime begins to swell, by slaking, the cracks and openings in the heap are filled with earth: and when the lime is reduced to powder, each heap is worked over, so as to mix thoroughly the lime and the earth. If nothing hinders the labor, this last operation is repeated at the end of 15 days—and then after waiting two weeks more, the mixture is spread over the soil.

10. The third process, which is adopted where culture is more perfect, where lime is dear, and which combines all the advantages of liming without offering any of their inconveniences, consists in making compost heaps of lime and earth, or mould. For that, there is first made a bed of earth, mould, or turf, of a foot, or thereabout, in thickness. The clods are chopped down, and then is spread over a layer of unslaked lime of a hectolitre\* for the 20 cubic feet, or a ton to the 45 cubic feet of earth. Upon this lime, there is placed another layer of earth, equal in thickness to the first, then a second layer of lime; and then the heap is

\* The hectolitre contains 6102.8 English cubic inches, or is equal to 2.82, (or about 2.6-7) Winchester bushels. Therefore the hectolitre is rather more in proportion to the hectare, than our bushel is to the acre. The decalitre (named next page) is the tenth of a hectolitre, and of course the "double decalitre," is the fifth. Tz.

finished by a third layer of earth. If the earth is moist, and the lime recently burned, 8 or 10 days will suffice to slake it completely. Then the heap is cut down and well mixed—and this operation is repeated afterwards before using the manure, which is delayed as long as possible, because the power of the effect on the soil is increased with the age of the compost—and especially if it has been made with the earth containing much vegetable mould. This method is the one most used in Belgium and Flanders: it is becoming almost the exclusive practice in Normandy: it is the only practice, and followed with the greatest success, in La Sarthe. Lime in compost is never injurious to the soil. It carries with it the surplus of alimentary manure which the surplus of product demands for its sustenance. Light soils, sandy or gravelly, are not tired by repetitions of this compost. No country, nor author, charges lime, used in this state, with having been injurious to the soil. In short, this means seems to us the most sure, the most useful, and the least expensive mode of applying lime as manure.

11. The reduction of burnt lime to powder by means of a momentary immersion in water, in handle-baskets, serves much to hasten the slaking, whether the lime is to be applied immediately to the soil, or in compost heaps—some hours in this manner sufficing, in place of waiting two weeks. However, the effect of lime, in this state, may well be different, as we have then the hydrate of lime, and less of the carbonate of caustic lime.\* If great rains follow, this process is not without inconveniences, because then the lime, which is already saturated with water, is more easily put in the state of mortar, which ought to be avoided more than every other injury to the manure.

The reduction of burnt limestone to powder, whether it be spontaneous, or by immersion, produces in the compost a bulk greater by one-half or more, than that of the stone—10 cubic feet, producing 15—or a ton, 10 cubic feet. This increase is not uniform with all kinds of lime; it is more strong with rich [*grasses*], waters, and weaker with the poor [*eaux maigres*.†]

#### Liming, as practised in different Countries. In the Department of Ain.

12. The applications of lime in Ain date from fifty years back. At the present time, the soil which has been limed is still more productive than the neighboring, not limed. Nevertheless, liming is but beginning to extend, while marling, which was begun fifteen years later, has already covered many thousands of hectares. This is because marling is an operation within the means of poor cultivators, being accomplished by labor alone; while liming requires considerable advances, especially in this country where lime is dear, and the dose given is heavy.

The dressings vary in quantity, from 60 to 100 hectolitres the hectare, according to the nature of the ground, and often according to the caprice of the cultivators. Although these limings have not been made with all the care and economy that was desirable, they have been very efficacious, when the soil has been sufficiently drained. The following tables, extracted from the

\* An incorrect expression certainly, but literally translated. Tz.

† We are unable to give the meaning, with certainty, of these provincial terms. They are probably equivalent to our "hard and soft" water—terms which are as little descriptive of what they mean, as the French "*eaux grasses*" and "*eaux maigres*."

registers of three contiguous domains, belonging to M. Armand, three years before, and nine years during the progress of liming, give us the means of appreciating the results. The quantities of seed and of crops, are calculated in double decalitres, or in measures of fifths of hectolitres.

1833	75	511	51	471

The application of 3000 hectolitres [8,490 bushels] of lime, of the value of 6000 francs [\$1116] upon 32 hectares [80 acres] of ground, made successively during nine years, has then more than doubled the crops of winter grain, the seed being deducted. The other crops of the farms have received a proportional increase; and the revenue of

the proprietor, in doubling, has annually increased two-thirds more than the amount of the sum expended in the purchase of lime. Still, there is not yet half the arable land limed, since of 66 hectares, only 32 have received this improvement.

The products of 1834 are still greater than those of 1833. But these are sufficient to prove the importance and utility of applying lime to suitable soils.

Many other examples sustain these results; and from them all it appears, that the wheat seedings are increased from double to triple—that the rye lands, from bringing four to five [to one of seed] in rye, are able to bring six to eight in wheat—and that other products are increased in proportion. The melioration then is, relatively, much greater upon bad ground than upon good, since it is two-thirds and more on the wheat land, and on the rye lands the crop is increased in value three-fold.

#### Flemish Liming.

13. The use of calcareous manures in the department of the North, as in Belgium, appears to be as old as good farming. It is now much less frequent in Belgium. The ancient and repeated limings have, as it seems furnished to great part of the soil, all that is necessary to it, for the present. But the department of the North still receives lime, marl, or ashes, every where, or nearly so, where lime is not a component ingredient of the soil. They distinguish in this country two kinds of liming. The first [*chaulage foncier*], consists in giving to the soil every 10 or 12 years, before seed time, four cubic metres, or 40 hectolitres of lime to the hectare.\* They often mix with the slaked lime, ashes of dead coal, or of peat, which enter into the mixture in the proportion of from a third to a half, and take the place of an equal quantity of lime. The other mode of liming [*chaulage d'assolement*], is given in compost, and at every renewal of the rotation, or upon the crop of spring grain. It is also in regular use in this country, still more than in Belgium, upon the meadows, on cold pasture lands, which do not receive the waters of irrigation. It warms the ground, and increases and improves its products. The older the compost is, the greater its effect, which lasts from 15 to 20 years, at the end of which time the dressing is renewed.

14. The limings of Normandy, the most ancient of France, are kept up in the neighborhood of Bayeux, while elsewhere they are forbidden in the leases: however, now they go over all the surface which has need of them; but in place of being applied immediately to the soil, as in the ancient method, the lime is almost always put in compost.

#### Liming of La Sarthe.

15. Of the modes of using lime, that of La Sarthe seems preferable. It is at once economical and productive, and secures the soil from all exhaustion. It is given every three years, at each renewal of the rotation, in the average quantity of 10 hectolitres to the hectare, in compost made in advance, with seven or eight parts of mould, or of good earth, to one of lime. They use this compost on the land for the autumn sowing, and placed alternately with rows of farm-yard manure. This method, of which the success is greater from day to day, is extending on the great body of flat argilo-silicious lands, which border the Loire; and it

\* 46 bushels to the acre, English or American measure.  
† 114 bushels to the acre.

would seem that this method ought to be adopted every where, on open soils that permit surplus water to drain off easily.—On very moist soils the dose of lime ought perhaps to be increased.

We would desire much to inculcate with force the suitableness, and eminent advantages, of using at the same time lime and [alimentary] manure. Here they do better still, in using at the same time a compost of lime with earth and dung. In addition, during the half century that the Manceaux have been liming, the productiveness of the soil has not ceased to increase.

16. The countries of which we have spoken, are those of France in which liming is most general. However, more than half the departments I think, have commenced the use, and in a sixth, or nearly, it seems to be established. Doubtless, the first trials do not succeed every where. There is required a rare combination of conditions for new experiments, even when they have succeeded, to induce their imitation by the great mass. Still, successful results are multiplied, and become the centres of impulse, from which meliorations extend.

#### English Liming.

17. The English limings seem to be established upon quite another principle from that of France. They are given with such prodigality, that the melioration upon the limed soil, has no need to be renewed afterwards. Whilst that in France we are content to give from a thousandth to a hundredth of lime to the tillable soil, from 10 to 100 hectolitres the hectare, they give in England from one to six hundredths, or from 100 to 600 hectolitres the hectare. The full success of the method of our country might make us regard the English method as an unnecessary waste. It seems that they sacrifice a capital five, six, ten times greater, without obtaining from it a result much superior; and that without lavishing [alimentary] manures also afterwards, that the future value of the soil would be endangered, in the hands of a greedy cultivator.

We will not urge the condemnation of a practice which seems to have resulted in few inconveniences. The abundance of alimentary manures which the English farmer gives to his [limed] soils, has guarded against exhaustion: and then, in very moist ground, they have doubtless by the heavy liming, made the soil healthy, and its nature seems modified for a long time to come; and such kinds, and where humus abounds, will take up a heavy dose of lime, and as it seems, always without inconvenient consequences; there is then formed there the humate of lime in the greatest proportion, and we will see that this combination is a great means of productiveness in the soil.\*

\* In this passage the author distinctly affirms the truth of the chemical combination in the soil of calcareous and vegetable (or other putrescent)—or the power of calcareous earth to fix and retain enriching matter—which is maintained in the *Essay on Calcareous manures*, (pp. 30, 31,) to be the most important action of calcareous matter as an ingredient of soil.—Still M. Puvion seems to attach much less importance to this than to other agencies of lime, which are considered in the *Essay* as of little value in comparison. Tr.

(To be continued.)

Extract of a letter, dated MOBILE, Dec. 19, 1835.—“Our Cotton market is very quiet since the Liverpool accounts of Oct. 30th, and the Message is daily expected. Our rivers are low, and supplies light.”

A letter from NEW ORLEANS, dated Dec. 19, states, “that business was very dull, and little doing. Sales of Cotton limited.”

## NEW-YORK AMERICAN.

DECEMBER 26, 1886—JANUARY 2, 1887.

## LITERARY NOTICES.

THE AMERICAN MONTHLY MAGAZINE for January, 1887. New York, GEO. DEARBORN. Boston, E. R. BROADBENT.—This Magazine comes to us enlarged by the incorporation with it of the *New England Magazine*, heretofore edited by *Park D. Benjamin*, who will continue as a joint editor of the periodical. It is handsomely printed, on fine paper, and has an etching of the grave diggers scene in *Hamlet*, executed with great spirit.

The first paper, by *COLE*, on American Scenery, is written with the taste and fervor of the artist, who has made to live on canvass, some of the very scenes he so well describes.

The paper on *Miss Sedgwick's* novels, does not overpraise the truly American character and tendency of her writings.

From another paper, "The Altar of Ammon," which is cleverly conceived as a frame wherein to set scattered offerings, we copy one—so happily characterized as "a gem of his double art, from the poet painter of our country."

These lines form the subject of a picture lately painted by the author, for *Mr. N. Appleton*:

ROSALIA.—By *Washington Allston*.

Oh, peer upon my soul again  
That sad, unearthly strain,  
That comes from other worlds to plain;  
Thou faltering, falling from afar,  
As if some melancholy star  
Had mingled with her light her sighs,  
And dropped them from the skies.  
No—never came from night below

have left here, are questions that have afforded matter for much speculation. It has generally been believed that the mounds in the western country are the work of their hands, notwithstanding that some ingenious gentlemen have lately argued, perhaps to their own conviction, that the mounds are the direct work of nature, and raised by the action of water. But as to the mounds, we leave the question where we find it—the old race have left other monuments.

The Indians found here by the discoverers, in fact never pretended to be the original inhabitants; but had a tradition, that their forefathers came into the country across the sea—probably Behring's Straits—that they found the country inhabited—that with the inhabitants they waged a long war, and ultimately drove them south into the sea.—Such was the tradition—the fact probably was, that the conquered people retired to Mexico.

The Mexicans also had a tradition strongly corroborative of this—that their forefathers lived at the north for many ages, and then gradually emigrated south.

These traditions alone, without any other evidence, afford ground for a strong presumption that the territory, now the United States, was inhabited by a race that afterwards peopled Mexico.—But the evidence does not stop here; there are other facts that go far to reduce the presumption to a certainty.

The Mexicans worked the metals for various purposes of use and ornament; the Indians found here by the discoverers never used the metals in any way, but wood, stone, shells, &c. supplied them with weapons and ornaments. Hatchets, swords, and arrow-heads of brass have been found in various parts of the United States, many of them in good preservation. These, although rude in form and design, are yet skillfully made; but with that pains-taking and laborious skill that ever marked the infancy of the arts.

But it may be asked, why are not these relics more frequently discovered, if it be true that a whole nation, to whom the manufacture of them was known, were once transient dwellers in this land? We think the wonder should rather be, how many of them have been preserved. The preservation of the few that have been found must undoubtedly be ascribed to the nature of the soil at the time of their deposit. Since in some soils, and under some circumstances, they would be preserved by earthy particles, uniting themselves with the salts of the brass in the first stages of oxidation, and thus forming a sort of petrified incrustation that would prevent decay.

But a discussion of these theories is not intended, since it would necessarily involve speculations too prolix and discursive for the limits of this paper; the main object of which is, to give a description of what we consider the most interesting relic of antiquity ever discovered in North America—the remains of a human body, armed with a breast-plate, a species of mail and arrows of brass; which remains we suppose to have belonged either to one of the race who inhabited this country for a time anterior to the so called Aborigines, and afterwards settled in Mexico or Guatemala, or to one of the crew of some Phœnician vessel, that, blown out of her course, thus discovered the western world long before the Christian era.

These remains were found in the town of Fall River, in Bristol county, Massachusetts, about eighteen months since.

In digging down a hill near the village, a large mass of earth slid off, leaving in the bank, and partially uncovered, a human skull, which on examination was found to belong to a body buried in a sitting posture; the head being about one foot below what had been for many years the surface of the ground. The surrounding earth was carefully removed, and the body found to be enveloped in a covering of coarse bark of a dark color. Within this envelope were found the remains of another of coarse cloth, made of fine bark, and about the texture of a Manila coffee bag. On the breast was a plate of brass, thirteen inches long, six broad at the upper end and five at the lower. This plate appears to have been cast, and is from one eighth to three thirty-seconds of an inch in thickness. It is so much corroded, that whether or not any thing was engraved upon it has not yet been ascertained. It is oval in form—the edges being irregular, apparently made so by corrosion.

Below the breast plate, and entirely encircling the body, was a belt composed of brass tubes, each four and a half inches in length, and three six-

teenths of an inch in diameter, arranged longitudinally and close together; the length of a tube being the width of the belt. The tubes are of thin brass, cast upon hollow reeds, and were fastened together by pieces of sinew. This belt was so placed as to protect the lower parts of the body below the breast-plate. The arrows are of brass, thin, flat, and triangular in shape, with a round hole cut through near the base. The shaft was fastened to the head by inserting the latter in an opening at the end of the wood, and then tying it with a sinew through the round hole—a mode of constructing the weapon never practiced by the Indians, not even with their arrows of this shell.—Part of the shaft still remains on some of them.—When first discovered the arrows were in a sort of a quiver of bark, which fell in pieces when exposed to the air.

The skull is much decayed, but the teeth are sound, and apparently those of a young man.—The pelvis is much decayed, and the smaller bones of the lower extremities are gone.

The integuments of the right knee, for four or five inches above and below, are in good preservation, apparently the size and shape of life, although quite black.

Considerable flesh is still preserved on the hands and arms, but none on the shoulders and elbows. On the back, under the belt, and for two inches above and below, the skin and flesh are in good preservation, and have the appearance of being tanned. The chest is much compressed, but the upper viscera are probably entire. The arms are bent up not crossed; so that the hands turned inward touch the shoulders. The stature is about five and a half feet. Much of the exterior envelope was decayed, and the inner one appeared to be preserved only where it had been in contact with the brass.

The following sketch will give our readers an idea of the posture of the figure and position of the armor. When the remains were discovered the arms were brought rather closer to the body than in the engraving. The arrows were near the right knee.

[This sketch we have no means of giving.]

The preservation of this body may be the result of some embalming process; and this hypothesis is strengthened by the fact, that the skin has the appearance of having been tanned; or it may be the accidental result of the action of the salts of the brass during oxidation; and this latter hypothesis is supported by the fact, that the skin and flesh have been preserved only where they have been in contact with, or quite near, the brass; or we may account for the preservation of the whole by supposing the presence of sulphure in the soil at the time of the deposit. In either way, the preservation of the remains is fully accounted for, and upon known chemical principles.

That the body was not one of the Indians, we think needs no argument. We have seen some of the drawings taken from the sculptures found at Palenqué, and in those the figures are represented with breast-plates, although smaller than the plate found at Fall River. On the figures at Palenqué the bracelets and anklets appear to be of a manufacture precisely similar to the belt of tubes just described. These figures also have helmets precisely answering the description of the helmet of Homer's *megas konthoides* Ektor.

If the body found at Fall River be one of the Asiatic race, who transiently settled in Central North America, and afterwards went to Mexico and founded those cities, in exploring the mines of which such astonishing discoveries have recently been made, then we may well suppose also that it is one of the race whose exploits with the *ballistas* deserve have, although without a date and almost without a certain name, been immortalized by the Father of Poetry; and who, probably, in still earlier times, constructed the *Classem* under ancient Rome, which have been absurdly enough ascribed to one of the Tarquins, in whose time the whole population of Rome would have been insufficient for a work, that would, moreover, have been useless when finished. Of this *Gangar* Race, who founded cities and empires in their eastward march, and are finally lost in South America, the Romans seem to have had a glimmering tradition in the story of Sydraxar.

But we rather incline to the belief that the remains found at Fall River belonged to one of the crew of a Phœnician vessel.

The spot where they were found is on the sea.

We extract entire the curious article, which follows, on American Antiquities:

## ANTIQUITIES OF NORTH AMERICA.

In the history of our country every thing relating to the earliest inhabitants must be interesting, not only to the professed antiquary but to the general reader. There is much evidence to show, that the post diluvian earth was originally one continent—that this country, America, was peopled from CENTRAL ASIA, before the dismemberment of that single continent—that the people brought with them the manners, arts, and civilizations of Central Asia; perhaps the very manners, arts, arms, and modes of warfare described in the Homeric poems; and that, sometime after America was separated from the other continent, immense hordes from the NORTH OF ASIA crossed Behring's Straits, and gradually took possession of the country.

Before these barbarian invaders the inhabitants retired south into Mexico, carrying with them the arts and civilization that afterward so astonished their more modern invaders from Spain.

It is a fact well known in history, that Cortes found in Mexico arms and utensils such as are known to have been used in Asia Minor, and such as have been found nowhere else. And the discovery recently made at Palenqué and Yehemal, plainly point to Central Asia as the country of their origin.

That the Indians found here by the discoverers were not the original inhabitants, has, we believe, never been disputed; on the contrary, it has ever been acknowledged that there was a distinct race anterior to them. But whence came this race, whither they went, and what monuments they

coast, and in the immediate neighborhood of "Dighton Rock," famed for its hieroglyphic inscriptions, of which no sufficient explanation has yet been given; and near which rock brazen vessels have been found. If this latter hypothesis be adopted, a part of it is, that these mariners—the unwilling and unfortunate discoverers of a new world—lived sometime after they landed; and having written their names, perhaps their epitaphs, upon the rock at Dighton, died, and were buried by the natives.

J. S.

ILLUSTRATIONS OF THE SKETCH BOOK OF GEORGE CRAYON, Gent., in outline, by C. MAYZ. New York, WILEY & LONG.—No. 1. of these really clever and spirited Sketches—by an artist, who, if encouraged, proposes to go on and illustrate in like manner the other writings of *Frederic*—refers to *Rip Van Winkle*.

We have here four plates—1. *Rip* escaping with his gun into the woods, from a scolding; 2. His meeting with the spirit of Hendrick Hudson; 3. His awaking; 4. His return to his village. They are very well done.

THE AMERICAN IN ENGLAND, by "the author of A Year in Spain." 2 vols. New York, HARPER & BROTHERS.—It may be some indication of the character of these volumes to say, that we read them through at a sitting—and as we are not omnivorous and are somewhat critical, we conclude to our own satisfaction, from this fact, that the book is a good one. Having begun at the beginning, by which we mean the preface, we expected no more than it is there set down we were to expect "a faithful narrative of whatever the author saw during a visit of a few weeks to England"—and that in the uninviting months of November and December. This narrative is given with grace, spirit, and originality. The writer sees with his own eyes, and judges with his own judgment, and herein alone, we apprehend, in this imitative world, is a great merit. There is nothing even attempted in these pages, of politics, statistics, nor other grave and important, and, for the most part, uninteresting topics connected with history and government—but simply a succession of impressions made upon an observing and reflecting man, as he journeyed hastily through a land of strangers—who yet, by reason of common origin and language, were not all strangers. We had intended to give some detached sketches—but our limits forbid—to-day at least. Meantime our readers will hardly fail of amusement, if they read the book for themselves.

[The rest of the Weekly Review is unavoidably shut out.]

The Committee of 125 held an important meeting on Thursday evening at the Mayor's office, at which the following among other proceedings were had. The Mayor presented the following letter from Senator VAN SCHAIK:—

"Mr. Van Schaick will be safe in advising the Citizens of New York that the Commissioners of the Canal fund are desirous to do whatever may be within their power and consistent with their duty, to relieve the citizens of New York from the consequences of the late calamity by fire, and that if they can have an assurance that a premium of 8 per cent will be offered, they will immediately advertise \$860,000 Chenango Canal Loan, bearing an interest at 5 per cent and redeemable at the pleasure of the Commissioners after the year 1845; and in case the loan should be taken by one or more Banks in New York, (having a capital of double the amount to be deposited,) the Commissioners will deposit the money with such Banks at an interest of 4 1-2 per cent payable quarterly, until the money shall be required in the progress of the Canal. Always however reserving to the Commissioners the right to draw at pleasure in case they shall deem the deposit unsafe.

Laid on the table.

Mr. Graham from the Committee on Insurance, made the following Report:

New-York, Dec. 31st, 1835.

SIR—The undersigned being a Committee appointed at a meeting of the General Committee of Citizens on the 21st inst., "to confer with the Insolvent Fire Insurance Companies, and to ascertain the bearing of the law and equity on claims upon them for losses incurred by the late fire and on the undetermined risks, and to endeavor to establish uniform principles of action by the said Companies," respectfully Report.

That in pursuance of their Trust, they have met the delegates from the Insolvent Companies, and those which apprehended they might be so, and have diligently and deliberately considered the questions which have been discussed and the difficulties which have been stated, and have given legal opinions on several of the points raised, with a view of aiding the Companies in the adjustment of their concerns.

We have likewise prepared and now report two several Bills which we are of opinion ought to be submitted without delay to the Legislature. They appear to us to be well calculated to afford relief to all parties concerned, without impairing the obligation of Contracts or the existing vested rights of any of them. The one Bill is intended to facilitate the adjustment of losses and the relief to which Creditors of the Insolvent Companies may be entitled. The other Bill is intended to revive and restore to their original vigor and action those Companies whose Capitals may have been absorbed in the calamity, as well as those Companies whose Capitals have been impaired and reduced.

That the Bills will meet the wishes entirely of any persons concerned in Insurance Contracts or in Insurance Capital, is hardly to be expected. There is intrinsic difficulty in affording relief to sufferers as Holders of Stock, and preserve unimpaired the rights of Creditors as holders of Policies. It was indispensable that nothing should be done to touch those rights, and it was most desirable that every proper means should be devised to afford prompt, easy, and economical relief to the Insurance Creditors, so far as legal provisions could afford it. So it has been deemed a matter of the utmost importance to the Commerce and Business of the city, that the Fire Insurance Companies should have the means of reviving their Capitals under better auspices than heretofore, and that some encouragement might thereby be afforded to suffering Stockholders.

Under these impressions the undersigned have prepared and agreed to the two Bills which they now have the honor to present. They have gone as far in the provisions as their sense of duty, and the legal rights of all parties in interest would permit them,

We have the honor to be  
with great respect,  
yours, &c.

JAMES KENT,  
DAVID B. OGDEN,  
P. A. JAY,  
DANIEL LORD, Jr.  
JOHN LORIMORE GRAHAM.

To the Hon. Cornelius W. Lawrence, Chairman.  
Mr. Disoway, from the Committee on losses, made the following Report:

The Committee appointed to ascertain the amount of losses by the fire on the 16th and 17th of December, submit the following Report, as the result of their investigations.

At the commencement of their labors, they published a notice requesting those who were interested to present statements of their respective damages from the fire. This course of enquiry they were obliged to adopt, as all private exertions on the subject became entirely useless, from the vastness of the undertaking. From the numerous accounts that were accordingly submitted, the Committee have learned of losses and insurance as follows:

	Buildings destroyed.	Stock destroyed.	Insurance on Stock and Buildings.
South street,	\$ 65,500	\$ 795,360	\$ 900,700
Front street,	100,000	542,160	661,700
Water street,	99,000	230,311	241,300
Pearl street,	225,200	2,515,000	3,334,000
William street,	100,500	904,725	1,194,000
Exchange place and Old slip,	120,000	1,021,000	1,015,000
Merchant street,	175,000	333,600	336,000
Hanover square			

and Stone street,	8,000	180,000	255,460
Coenties slip,	7,000	8,300	11,000
Merch'ts Exc'ge,	150,000		
Garden st. church,	60,000		30,000
	\$1,179,700	\$6,557,846	\$7,999,160

The value of 129 of the buildings destroyed, according to the above statement, is \$1,179,700  
And of stock, 6,557,846  
Making the total loss reported to the Committee, \$7,737,546

Upon this amount, those interested, also show insurance effected to the sum of \$7,969,150

These statements were made by 276 firms and owners of real estate; which latter class, however, form but a small part. From a vast majority of owners of buildings, no accounts have been presented.

The Committee have thus stated, in the foregoing particulars, all the facts which have come to their knowledge, during the investigation committed to their charge. As it regards the total destruction of property by the terrible conflagration that visited our city, we are compelled to make our calculations from the data now before us, and such other aid, as the Committee can place reliance upon.

The whole number of buildings destroyed, is ascertained to be 537, exclusive of the Exchange and the South Dutch Church, and may be fairly valued at \$4,000,000, which is a fraction over \$7,000 each, and is generally considered a correct estimate. As far as the Committee can ascertain, less than one half only of the mercantile houses have reported their loss in goods by the late fire. By duplicating this amount, (6,557,846) we have

\$13,115,000

As the probable total sum destroyed in Merchandize of all descriptions. Add to this, the estimated value in buildings, \$4,000,000

And the whole loss may be calculated at \$17,115,000.

Judging from the property destroyed in stores upon the different streets, and the business of those who occupied them, there has been consumed, as reported, in Groceries, Foreign and Domestic Produce,

\$1,596,000

In Imported and Domestic Dry Goods, including an inconsiderable item of Hardware and

Crockery, \$4,961,615

And in Real Estate, \$1,179,700

The Committee are of opinion that the above calculations are in no respect exaggerated. And great as the loss has been, they cannot conclude their report, without expressing their hope, that our city, from the various plans of relief, now proposed, will, ere long, Phenix like, arise from the ashes of her late misfortune, to her usual commanding, uninterrupted and prosperous business.

GABRIEL P. DISOWAY, Chairman.

Nathaniel Weed, B. L. Woolley, Walter R. Jones.

The Committee to whom was referred the duty of devising some means for the relief of the widows, orphans, and others, who lose by fire insurance stocks—reported a plan, calling on the State to ask from the General Government a loan of six millions, at 3 per cent, which it should invest in the bonds and mortgages of the Companies, and with the difference of interest received, and that paid, to constitute a fund, out of which the losses of stockholders should be defrayed. This report was, after discussion, laid on the table.

A proposition, by Mr. P. L. Miles, for a loan from the State of fifteen millions to the Banks in this city, was lost.

On motion of Mr. W. B. Lawrence, it was resolved, That the Chairman memorialize the Legislature for the repeal of the law taxing foreign capital vested in bonds and mortgages.

SUDDEN REVERSE.—The Easton *Agus* relates the death, at Stonewater village, of a young lady, Miss Winslow—by being overturned in a sleigh on going home from a wedding party. She was taken up senseless and carried back to the bridal circle, she had but a few minutes before left—and shortly died.

**ROCHESTER EDGE-TOOLS.**—Among the various branches of business now in successful operation in the city of Rochester, none are more deserving of attention than the manufacture of Edge-Tools. To such perfection is this carried, that nearly all descriptions of the article can be furnished from our manufactories with a finish and, at a price which are rapidly giving them a preference over the wares of Sheffield and Brummagem. Mechanics and others who use such articles have a deep interest in encouraging our own manufactories—as thereby they can have tools warranted of the first quality, while the encouragement bestowed on our own artisans promotes our domestic welfare, and aids in insuring an excellent supply at reasonable prices from our own workshops.

The Edge-Tools fabricated by Messrs. *Barton & Babcock*, are creditable to themselves and to the character of our mechanic arts. All who have used them concur in their praise. The manufactory is in the stone building at the southwest corner of the main bridge across the river. They employ about twenty-five hands, on an average—consume from 12 to 14 tons of iron, 8,000 lbs. cast steel, 500 lb. of borax, 30,000 bushels of charcoal, &c. Judging from the success of the experiment which they have already made, their business will soon be greatly extended, as the excellence of their manufactures becomes as generally known as it deserves to be.

We can bear willing testimony to the correctness of the encomium passed by "Rho," on the gentlemen and articles referred to in the above notice. We speak from personal observation and inspection—and would recommend them to the patronage of the public.—[Ed. M. M.]

**THE LABORING CLASSES IN EUROPE.**—The North American Review for October, commences a discussion of this subject, which, if the conclusion equals the present portion, ought to be circulated by thousands, as a tract, throughout the land.

The writer of the interesting article to which we have just referred, notices the condition of the laboring classes in Europe, in respect "to the rate of wages, the burden of taxation, the means of subsistence, the facilities of acquiring education, and the share, if any, which these classes have in the government." The facts, in regard to each of these particulars, ought to make those hang their heads with shame, who, in this community, talk of the oppression of the laboring classes by the rich, and of the withholding of rights from the common people.

In Norway, "the ordinary food of the peasantry is bread and gruel, both prepared of oatmeal, with an occasional intermixture of dried fish. Meat is a luxury which they rarely enjoy."

In Sweden, the dress of the peasantry is prescribed by law. "Their food con-

sists of hard bread, dried fish and gruel, without meat."

In Denmark, the peasantry are still held in bondage, and are bought and sold together with the land on which they labor."

In Russia, "the bondage of the peasantry is even more complete than it is in Denmark." The nobles own all the land in the empire, and the peasantry, who reside upon it, are transferred with the estate.

"A great majority have only cottages, one portion of which is occupied by the family, while the other is appropriated to domestic animals. Few, if any, have beds, but they sleep upon bare boards, or upon parts of the immense stoves by which their houses are warmed. Their food consists of black bread, cabbage, and other vegetables, without any addition of butter."

In Poland, "the nobles are the proprietors of the land, and the peasants are slaves." A recent traveller says, "I travelled in every direction, and never saw a wheaten loaf to the eastward of the Rhine, in any part of Northern Germany, Poland, or Denmark. The common food of the peasantry of Poland, the working men, is cabbage, potatoes, sometimes, but not generally, peas, black bread and soup, or rather gruel, without the addition of butter or meat."

In Austria, "the nobles are the proprietors of the land, and the peasants are compelled to work for their masters during every day of the week, excepting Sunday. The cultivators of the soil are in a state of bondage."

In Hungary their state is, if possible, still worse. The nobles own the land, do no work, and pay no taxes. The laboring classes are obliged to repair all the highways and bridges, are liable at any time to have soldiers quartered upon them, and are compelled to pay one-tenth of the produce of their labor to the church, and one-ninth to the lord whose land they occupy.

Of the people of France, "seven and a half millions do not eat meat, or wheaten bread. They live upon barley, rye, buckwheat, chestnuts, and a few potatoes." [We saw it stated, the other day, that some workmen, we forget in what part of New-England, had a turn-out because their employers would not furnish them with tea and coffee at dinner!]

The common wages of a hard laborer, in France, is \$37 50 for a man, and \$18 75 for a woman, annually. "The taxes upon the land are equal to one-fifth of its nett products."

In 1791, there were 700,000 houses in Ireland. Of these, 113,000 were occupied by paupers—and more than 500,000 had only one hearth. The average wages of a laborer is from nine and a half to eleven cents a day.

Among the laboring classes of the industrious Scotch, "meat, except on Sundays, is rarely used."

In England, the price of labor varies. "The Nottingham stocking-weavers, as stated by them in a public address, after working from fourteen to sixteen hours in a day, only earned from four to seven shillings a week, and were obliged to subsist upon bread and water, or potatoes and salt!"

The American Quarterly Review will be published hereafter by Mr. Adam Waldie, favourably known as the proprietor of the Select Circulating Library. George M. Wharton, Esq., of the Philadelphia Bar, has been associated with it as co-proprietor and co-editor. Mr. Wharton has been a distinguished contributor heretofore to its pages.

**FROM THE SOUTH.**—The steam packet *Columbia*, brings Charleston papers to Saturday last. The news of the great fire in New York had reached Charleston, and created a strong feeling of sympathy for the sufferers. It was suggested that a general meeting of merchants should be held, to unite with the citizens of Philadelphia and other places, in urging upon congress to adopt some measure of relief for the New York merchants.

**Seminole Indians.**—The Southern Patriot of Saturday, contains the following paragraph:—

"We learn from a passenger arrived this forenoon in the schooner *Medium*, from Musquito, E. F., that the Seminoles had embodied themselves at Alachway, about the time our informant left, which was on the 15th inst., to the number of 1500 strong, and that a party of wood cutters, twenty-five in number, had been fired on by them and driven away last Saturday. They had chartered a vessel and sailed for Attakapas."

"All the females of Musquito county had been removed to St. Augustine, for safety, and the men about Alachway were sleeping in Log Houses, for greater security. The alarm of the inhabitants in the vicinity is represented, as may be supposed, to be very great."

NEW-ORLEANS, DEC. 15.

Latest from Texas.

Our previous accounts from San Antonio were to the 25th. By an arrival yesterday, we have information two days later from the seat of War in Texas.

Our informant states that a detachment of Gen. Cos' Cavalry, out procuring grain for the horses, were attacked on the 27th ult. by a party of Texans and by them defeated with the loss of thirty-five horses, and suffering in killed and wounded, to the number of fifty men. The loss of the Texans, three men—slightly wounded. Cos' detachment of Cavalry consisted of about 150 men, which, before the engagement was concluded, were reinforced by 190 infantry; the party of Texans employed in the assault amounting to about the same number.

**GEN. MEHER DEFEATED AT TAMPICO.**—Intelligence was received in town last evening by a member of Gen. Meher's corps, who came passenger in the schr. *Halcyon*, that the schooner *Mary Jane* (which took Gen. M. and his company to Tampico) was lost on the Bar, in attempting to get in. The crew and company arrived safe on shore. The General then marched to the fort at Tampico, which he took possession of without opposition, and attacked the town at night, but was repulsed with the loss of several killed and twenty-two taken prisoner—the remainder, including Gen. Meher, escaped, and took passage on board a vessel for Brazoria, where they safely arrived—many of whom are waiting an opportunity to return to this city.

The following incident is related without a word of comment, in the *Louisville Journal*: as though it was a mere matter of course thus to shoot a man-naced and unarmed man:—

A few weeks ago, one D. W. Crenshaw, a member of the Murel gang and a notorious horse-thief and negro-stealer, was confined, for crime, in the jail at Woodville, Mississippi. Before his imprisonment, he was heard to make remarks, which excited a suspicion, that he intended to take the life of Dr. Webb, a respectable physician, and the principal witness against one of Crenshaw's accomplices. Dr. W., never having seen Crenshaw, called at the prison for that purpose. His name, however, was no sooner announced by the Jailer, than the prisoner, who was of Herculean stature and strength, started up and rushed furiously upon him, with the intent, it is supposed, of killing him with his handcuffs. The Doctor, with admirable presence of mind, instantly drew a pistol and shot his assailant, who died a day or two afterwards.

## AMERICAN RAILROAD JOURNAL.

NEW YORK, DECEMBER 26, 1835.

*Our Subscribers to the RAILROAD JOURNAL residing out of the city of New-York, are respectfully requested to remit by mail, Five Dollars, the amount of subscription for the ensuing year. Circumstances require prompt action in relation to it, by those who desire to have it continued.*

*I again pledge myself that it shall be continued another year, to those who are willing to aid it, by paying in advance.*

*After the close of volume IV., it will not be sent to those who are now indebted for it, until arrearages are paid. Justice to the patrons of the Journal requires me to say that the number who have not paid is small, yet the amount now due, for past volumes, would very much aid me, if it should be promptly remitted, in making the Journal what it should be.*

**CHAMPLAIN AND ST. LAWRENCE RAILROAD.**—We find in the Montreal Courier, of December 17th, the proceedings of the half yearly meeting, of the stockholders of the above named railroad, accompanied by the Report of the Committee of Management, and the Chief Engineer. From the Report of the Committee, we make an extract, and publish the Report of the Engineer, Mr.

Casey, with the proceedings of the meeting entire, together with some appropriate remarks of the Editor of the Courier.

The remarks of the Engineer and of the Editor, in relation to the benefit which the people will derive, from the expenditure of so much money amongst them, are equally applicable to most other works of the kind.

The plan of doing the work by days, and not by contract, is not common on such works. It may be, however, and we are inclined to think it is, where the people of the vicinity upon whom reliance can be placed, will engage in the work, a matter of economy.

By this report it will be seen that the spirit of improvement is spreading northward as well as southward—who can tell where it will stop?

[This Report is crowded out by the Governor's Message—it will appear next week.]

We give the Governor's Message entire in this number of the Journal.

We give at length the proceedings of the opening of the New-Jersey Railroad to Rahway, for which we are indebted to the Jersey City Gazette.

We are indebted to Professor Renwick for an interesting article, which will be found in this number, upon *Soluble Glass*, as a preservative against fire.

The Convention will assemble at Albany on Monday, the 11th January. It is much to be hoped that there will be a full attendance from all parts of the State.

**FIRE IN NEW BRUNSWICK.**—About 5 o'clock on Saturday morning last, a fire broke out in the currying shop of the extensive tannery of Mr. John W. Stout, lying at the junction of the Trenton Turnpike with New

street, New Brunswick, which destroyed the upper lofts of the building, together with a large quantity of leather contained therein. Loss estimated at \$9000—of which \$3500 was covered by insurance in the New Brunswick office.

About 6 o'clock the same evening another fire broke out in a building owned by Mr. George King, on Commerce square, which was extinguished with but trifling damage.

On the same day, and between the periods of the occurrence of these two fires—as we learn from the Times—a meeting of the citizens was held in the court house; to consider the propriety of petitioning the legislature to confer upon the corporation the necessary power to lay a tax for the purpose of more effectually preventing the ravages of fire, by providing an adequate supply of water. After a stormy debate, it was decided that it was inexpedient to make the application.

A writer in the New Brunswick Times, upon the difficulties attending the further grant by the Legislature of the privilege to make a rail road to New York, to compete with that of the joint companies, after stating the case pretty fairly, proposes as follows:—

“And now for the remedy. It is this—to require from the joint companies that they should make a rail road from New Brunswick to Trenton, by the shortest and most practicable route, to connect with the present East Jersey rail road Company and rail road from Morrisville to Philadelphia. To compensate the joint companies for this expenditure, give them right to charge \$4 each passenger from New York to Philadelphia, and relieve them from the necessity and expense, of making the branch from New Brunswick to Spotswood. Of this additional sum of one dollar to the fare, oblige the company to pay to the State the sum of twenty five cents for each passenger. And regulate the fare of way passengers in such manner, that the citizens of the State will be secure from all impositions.”

**IMPROVED LINE OF RAILWAY.**—By the following Report, it will be perceived that an important improvement is about to be made in the Railroad from Philadelphia to Columbia.

It is by many deemed important to avoid Inclined Planes on Railroads, and for this purpose a new line, called West Philadelphia Railroad, has been surveyed and located, by which the Inclined Plane on the present route will be avoided.

The statement in relation to the power of Mr. Baldwin's Engine, is very satisfactory to those who take pride in the progress of American manufactures.

To the President and Managers of the West Philadelphia Railroad Company:

Gentlemen,—I have the honor to report, that the line of the West Philadelphia Railroad has been located (in conformity with instructions received from the Board.) The ground over which it is traced is well adapted to the construction and grade of the Road. The excavations and embankments are generally light, and are by no means of an expensive character. But few small streams are crossed, and consequently but few culverts or bridges will be required, which will be built of stone, in the most permanent and durable manner. In the location of the route, particular care has been taken to avoid curves, and no curves have been made upon a less radius than four thousand feet. The maximum rise of the graded surface of the Road is 46 feet per mile, which is only one foot per mile more than the maximum grade of the main line of the Columbia and Philadelphia Railroad. A small portion of the line is level, and about one and a half miles are graded at 36 feet per mile. The average grade is 43 3-10 feet per mile; its length being 7 1/2 miles, and total rise 325 feet. From its junction with the Columbia Railroad, a short distance below the Buck Tavern, the route is nearly straight to the Market Street Permanent Bridge over the Schuylkill River, and more direct than the main line of the Columbia Railroad. By its completion, a new outlet will be opened to the travel and transportation of the Columbia Railroad, and the inclined plane at Belmont will be avoided. The distance from the city of Philadelphia to the head of the inclined plane is about four miles—the nearest point to which the locomotives can approach the city. By the West Philadelphia Railroad locomotives can carry their trains to the line of the city proper, at Market Street Permanent Bridge, and to

the Schuylkill opposite of cars by this route motive engines will gain one of those which pass over, by the main route of the ad. This circumstance is an inducement to divert the portion of the transportation of the West Philadelphia Railroad. Statements in the public papers, since the commencement of the West Philadelphia Railroad, that the construction of a line was contemplated by the Canal Commissioners of the State, by which the inclined plane is to be avoided without exceeding a grade of 25 feet per mile, and an increased distance of two miles. It is due to the stockholders of the West Philadelphia Railroad, and to the public to state, that no such route exists, and that the name of the engineer, given as authority upon

which that statement was made, was used without his consent. It is also a fact susceptible of the clearest proof, that no route exists, by which the inclined plane of the Columbia Railroad can be avoided, embracing so many advantages as the route of the West Philadelphia Railroad.

The importance of avoiding inclined planes upon Roads constructed for the accommodation of passenger travelling, is beginning to be justly appreciated. By reference to the recent Report of the Baltimore and Ohio Railroad Company, it will be found that measures have been taken by them to abandon those parts of their Road upon which inclined planes are constructed, and to construct new lines, on which locomotive engines can ascend without the aid of stationary power.

By experiments made on the Columbia Railroad, with locomotive engines, the question was settled, that 45 feet per mile is an inclination upon which that species of power can be applied with more advantage than any other. The fact that the original design was abandoned, of adopting stationary engine power on the Rainhill and Sutton inclined planes, of 55 feet per mile, on the Liverpool and Manchester Railroad in England, to the more advantageous use of locomotive engines, might also be adduced as an evidence that even steeper grades may be safely adopted.

The locomotive engines on the Columbia Railroad, which were manufactured by M. W. Baldwin, of Philadelphia, carry trains of twenty and twenty-four cars, containing each three tons of merchandize, up forty-five feet grades, at from ten to twelve miles per hour; while engines of English construction, from the works of Robert Stephenson, Esq., the celebrated Engineer, carry, upon the same Road, only fourteen cars at the same rate and speed. This great difference is produced by the superior arrangement and mechanical application of power to Mr. Baldwin's engine, and not from any difference in the weight and adhesive power of the respective machines.

It has been clearly ascertained that Mr. Baldwin's engines under all circumstances, are able to generate more steam than is adequate to overcome the adhesion of the wheels upon the surface of the rails, while those of English construction are unable to keep up a sufficient supply. These facts are mentioned as evidence of the progressive improvements in the science and construction of locomotive engines, and of the perfection to which their manufacture has arrived in our own country. The durability of these engines and the amount of annual repairs, are not less striking than the result of their effective force.

Enough, it is presumed, has been said to prove conclusively, the superiority of the route of the West Philadelphia Railroad, over that portion of the Columbia Railroad which it is destined to rival. With regard to the comparative distance of the two lines the former is about half a mile shorter than the latter, from the intersection of Broad and Market streets. The whole cost of the West Philadelphia Railroad, including a double track of edge rails, laid on foundations of locust timber, will be \$250,000.—The work is all under contract and rapidly progressing to completion.

The grading will be finished by the first of June, 1836, and the rails will be laid ready for travel, by the first of September following. Contracts have been made for iron edge rails of a pattern similar to those of the Camden and Amboy Railroad, to weigh sixty pounds per lineal yard, and also for all

the materials necessary to complete the work, which are to be delivered in all the month of April next. The Board have every reason to be satisfied with the progress of the work under the respective contracts. The prices are generally fair, and no obstacles exist to the completion of the road, within the time specified in the contract.

H. R. CAMPBELL,  
Engineer West Philadelphia Railroad.  
Philadelphia, Oct. 15th, 1835.

From the Jersey City Gazette.

#### RAILROAD EXCURSION.

We noticed in our Saturday's paper, that an experimental excursion had been made on Thursday, from Newark to Rahway, by the locomotive on the New-Jersey rail road. The Newark Daily Advertiser of Saturday, contains an account of the excursion, of which we avail ourselves. The company invited consisted of the selectmen of Jersey City, the town council of Newark, the mayor and aldermen of Elizabethtown, and many other distinguished citizens of the state; who were accompanied by the directors and officers of the rail road company. The distance from Newark to Rahway, eleven and a half miles, was traversed by the locomotive with a train of cars, in from 25 to 30 minutes. On its approach to Rahway, the party were generously saluted by the discharge of artillery, and the acclamations of a large body of citizens assembled to receive them. The enthusiasm of the occasion was fitly represented, by the stars and stripes floating over the entrance of the road into the town, significantly proclaiming in striking capitals the progress of "THE PEOPLE'S RAIL ROAD."

A handsome entertainment had been provided by the liberality of the citizens at Freeman's Hotel, where the congratulations of the parties were cordially reciprocated. The company was received in behalf of the citizens of Rahway by E. Y. Rogers, Esq., who addressed the President in a neat and appropriate speech, of which we give a general sketch. Mr. Rogers said—

Mr. President and Gentlemen—The hour in which the New-Jersey rail road was conceived was an eventful era in the history of our state. The day which dawned upon its partial completion and witnessed its operation at our sister town, Newark, was hailed with pleasing emotions. But a few days have passed since the citizens of Elizabethtown greeted the arrival of the locomotive within their precincts, and now upon the eve of the new year, it has advanced into our borders, and gives sure evidence of the speedy consummation of hope long and devoutly cherished.

Placed as she is by the hand of nature between two other states, which have become populous and wealthy, New-Jersey has labored under serious disadvantages. To her has been the servile part of ministering to the profits of others, whilst her claims to their observation have been unheeded; and not of this alone has she to complain; but the finger of derision has been pointed at her, and the bitter tongue of prejudice has been busy with her name. And why was this? Why, but they who judged her, knew her not? They knew not her internal worth, and this they knew not because they never beheld it.

Our state has ever been the great highway for travellers from every part of the Union; but through what parts of it have they passed? Ever through its poorest and most unseemly portions. Where is the traveller

who, in his journeying through our state by the accustomed public route, has ever been favorably impressed with its aspect? What did he see of it? Nothing, save the marshy low lands, which alone were to be seen as he passed along its shores, or the lonely waste through which he was hurried in the stage coach; and though in later times he has found the locomotive in operation, yet, as by design would it seem, is he still carried through the veriest barren that can be found, search the state throughout. From this cause have the minds of strangers become set against us, the blighting influence of which upon our increase has long been felt by our citizens.

But, sir, New-Jersey has some bright and sunny spots. The genius of improvement, in his onward march, has not passed us by unnoticed, and we trust there is that spirit abroad which will "do the state some service."

To keep pace with the improvement of the age, to build up her towns and villages, and to take her merited rank among the other branches of the Union, it has long been seen, that the avenue of intercourse with her neighbors must be changed. Such is the great and praiseworthy object of the New-Jersey rail road and transportation company.

Sir, when we look upon it, and see the kind of communication which is preparing for us; when we behold that mighty invention, the steam engine, forsaking, as it were, its native element, and stalking boldly on the land, who can withhold his admiration? When, we are at once led to ask, will the improvements upon this mighty power reach their limits? Who is there, that, but a few years since, would have believed that man could have ever so far outstripped the flights of time? Who could have believed that by any human power, remote and distant places could have been brought into near vicinity?

Time, sir, will not permit, neither is there need for me to enumerate the many advantages which this road opens to our reach. The benefits to the state and to the nation, in times of peace, and when the loud alarms of war are sounded, (should ever again such discordant notes be heard in our land,) are obvious. The ready market which is thus afforded for every kind of produce, and for all the varieties of manufacture, is easily to be seen.

But, sir, there is another benefit which to my mind the people of this great nation will soon be led to acknowledge, as the greatest good which rail road communication will afford. It is one which far surpasses any sectional feeling or local advantage which the citizens of one town or of one state may experience. It points to our country, and silences the little feelings of self-interest.

We have a vast extent of territory, an infinite variety of soil and produce, and hence a variety of interests must of course pervade our country. These, as might naturally be expected, have already created jealousies, and a diversity of sentiment on questions of national import. This feeling, fanned and kept alive by prejudice, which in this, as in most cases where it exists, results from a want of proper information, will, it seems to me, be checked by a spirit of forbearance and mutual respect, when the inhabitants of the different states become better acquainted. The north and the south, the east and the west, have been too much estranged from each other; too little conversant with each other's feelings and interests for the preservation of harmony and uninterrupted unanimity; but now, by the happy mediation of the locomotive, they will be brought into frequent and easy intercourse, to the ready exchange of sentiment; they will see each

other face to face, and thus found the basis of secure and abiding friendship. Old prejudices will thus be extinguished, and our bond of union be firmly and indissolubly cemented. Our extended boundaries will then no longer stand as a barrier to that unanimity of feeling which should pervade the people of one nation.

Permit me, sir, on behalf of the citizens of Rahway and its vicinity, to express our heartfelt satisfaction at the progress which your great work is making, and to welcome the arrival of the first car this day within our borders. Yes, sir, we hail the rumbling of the locomotive as the glad omen of future prosperity; we have no misgivings as to the issue, nor do we believe that the most sanguine advocate has ever yet imagined the probable benefits of the construction of this road. Fully assured, sir, of its entire success, and impatient to behold its completion, in conclusion, I give you—

Railways—Nullifying distance, yet preserving the Union.

Gen. DARCY, as President of the company, handsomely responded to the congratulations in nearly the following terms:—

Permit me, Mr. President, in behalf of the directors and stockholders of the New Jersey rail road and transportation company, to express to you and to the enterprising citizens of Rahway whom you represent, our acknowledgments for the warm-hearted and kind reception we have received on this occasion.

We can most cheerfully reciprocate all your expressions of gratification in the completion of our road to this place, and do most confidently hope that it will prove a source of great advantage to your already prosperous community.

That public works of this character have in other states contributed largely to the prosperity of their towns and villages, is not to be controverted. It is well known to us, that this place has long been manufacturing largely for the southern market, notwithstanding its remoteness from the great commercial emporium, and the ordinary track of the southern merchant. If under such adverse circumstances, your business has been sustained, what may we not anticipate when this shall become the great thoroughfare from the south and west, bringing to your very doors thousands in pursuit of the fabrics of the east and north? It cannot be controverted, that the principal towns on this route between New-York and Philadelphia, require only a fair participation in rail road communication, to insure to each and all of them a new era, in relation to their business and prosperity.

While we are thus briefly contemplating what may be done to extend our towns and villages, we are not unmindful of the effects to be produced upon the more numerous, and equally respectable and important portion of our fellow citizens engaged in agriculture. The prosperity of the farmer even in the distant, but productive counties, of Sussex and Warren, is closely allied to the prosperity of these very towns. In proportion as these towns are augmented, and business increased, is every acre of those lands made more valuable, and so vice versa. If the improvements of the age are withheld from us, and extended to all the principal towns in the adjacent states, the prosperity of the farmer, as well as the mechanic and merchant, in this state, will rest on a very doubtful basis. Why do the intelligent farmers of the great states of New-York and Pennsylvania, cautiously direct all their roads, canals and pecuniary facilities, so as to sustain and build up their principal towns and cities? Is it for the particular benefit

of those places? Have they not an eye to interests which should be better understood by the farmers of New-Jersey? The farmers of this state know well the natural barriers of free access to the markets of New-York and Philadelphia. Let them nobly sustain the interests of their own towns, and the reaction must be beneficial to themselves. Are the farmers of New-Jersey aware of the penny-wise policy pursued by their Legislature—that for every sixpence saved from taxation, they lose a dollar, by the policy of keeping in a state of depression almost every town and village on this most important route?

The agriculturalists of this state have the power of controlling its legislation, and we have too much confidence in their intelligence to suppose that they will long neglect a subject so vitally important to themselves, their towns and their villages. Some of the interior counties and towns are awake to the improvements of the day, and are procuring for themselves the great advantages of rail road communication. In one year from this day, a rail road will be in operation from Newark to Morris; and a most liberal charter is now in the possession of the citizens of Sussex, which will enable them to extend a rail road from Morristown to Carpenter's Point, where the New-York state line strikes the Delaware river—a point from which the great Erie rail road, now in the course of construction, cannot depart. They will find their fellow citizens of Essex ever ready to unite with them in obtaining so desirable and perfectly feasible an object. Other local improvements, for the benefit of Monmouth, Somerset, Hunterdon and Warren, are either in contemplation, or fast approaching maturity. I do confidently hope, that the day is not far distant, when the citizens of every county in this state will be enabled to travel from their county towns by rail road communication with each other, and with a main line on the most direct route to Trenton, our seat of government. The citizens of New-Jersey, as sagacious and intelligent as those of any other state, will, I hope, without doing injustice to any one, abandon any course of policy, (adopted by improvident legislation,) which may interfere with the accomplishment of so desirable an object.

From the effects already produced upon the town of Newark, by the construction and use of our rail road, we have a right to infer that your citizens will be greatly benefited, and we have the pleasure of assuring you, that its extension to New-Brunswick will be perfected in the early part of the next season. We will then have consummated a very desirable object, fully in accordance with the provisions of our charter, without a single application to the Legislature for any modification or amendment.

In the progress of our work we have had some difficulties to surmount, and much vexation in procuring title to lands or right of way, upon what we consider fair terms. We acknowledge many honorable exceptions, and avail ourselves of this opportunity of expressing our gratitude to the citizens of Rahway for their liberality on that subject.

Allow me, Mr. Chairman, to conclude with a sentiment:—

*The citizens of Rahway*—Distinguished for their enterprise and hospitality.

After this exchange of hospitalities, a number of sentiments were given by gentlemen present, among which were the following:—

Hon. Aaron Ogden—A straight line of Rail Road through New-Jersey—A link in the chain of rail way destined to be constructed from Maine to Louisiana.  
J. J. Chetwood, Esq. of Elizabeth—Public opinion,

like steam; it may be compressed for a while, but sooner or later it must have vent.

Smith Scudder, Esq.—*A Rail Road from Trenton to New Brunswick*—while it confers on the people of New Jersey their just rights, it likewise provides them with facilities for easy access to their seat of government.

Adam Lee, Esq.—*Railway—Monopolies and exclusive privileges*—always wrong. May the state resume all she has granted, as soon as possible, and grant no more. But in good faith, abide by all its contracts, from which an honest court of conscience will not release it.

Mr. Thorp of Rahway—*Home Manufactures*—Worthy of protection when useful to the people; but deserving opposition when of monopoly texture.

Mr. Thomas A. Green—*The People's Rail Road made to be rode over, but not to ride "the People."* By a Citizen of Middlesex—*The extension of the New Jersey Rail Road into Middlesex*—Another link in the chain, designed to bind down the monster monopoly, which has so long lorded it over the people.

Gen. John S. Darcy—*The State of New Jersey*—May she imitate the wise policy of Pennsylvania and New York, in extending legislative favors to her large cities and towns, so that by facilitating their intercourse and means of business with her agricultural districts, all may rapidly advance in growth and prosperity.

John P. Jackson, Esq.—*The State of New Jersey*—Rich in revolutionary renown and internal wealth. May she ever guard with patriotic care her liberties and her resources.

On the return of the train to Newark, an accident occurred, which we have heard spoken of with some degree of exaggeration, as appears from a statement in the Daily, which says, the accident, we learn from the officers of the company, was occasioned by the following cause:—The lever and fastenings for changing and securing the turnout in Elizabethtown, not being completed for use, as there was no necessity for passing on it, the chief engineer ordered the switch to be firmly fastened with *strong bolts*, which the mechanic charged with the service did not attend to, but substituted a *mere spike*, which, by bending from the pressure of the train, moved the switch so as to pass a part of the cars between the rails. The train consisted of four passenger cars and three baggage cars. One passenger car, and one dirt car only sustained material injury, and we are happy to learn that no bones were broken, nor any lasting injuries occasioned to the passengers. All the cars but the two injured proceeded to Newark, and performed another trip to Rahway and back again with passengers. Yesterday, the locomotive passed ten times over the road between Newark and Rahway, carrying about one thousand passengers with entire security and comfort. The above accident, it will be perceived, was from a cause which in no way affects the general safety of rail road travelling, and like the occurrence of all untoward events, will induce greater caution in future.

The locomotive, with a train of cars, will for the present make three trips per day, to and from Newark and Rahway.

Our contemplated Railroad to Wheeling and Pittsburg, says a Baltimore paper, will be but a link in the great chain that will hereafter be extended westward from the waters of the Ohio. The following article from the Wheeling Gazette shows that the people of Ohio are already beginning to regard Wheeling as only a point on the route between Baltimore and the far west. The same considerations which, during the era of turnpikes, led to the construction of the Cumberland Road as a great central national avenue between the east and west, are just as weighty and forcible at the present time—nay, much more so—in favor of the Railroad.

**RAILROAD FROM WHEELING TO ZANESVILLE.**—A meeting of the citizens of Zanesville was held on the 16th inst., (A. Harper chairman, A. Peters Secretary,) at which it was resolved—

That the project of a railroad from Zanesville to Wheeling is practicable.

That as a continuation of the great Baltimore and Ohio railroad, it embraces more of State interest and national importance than any other proposed route within the State.

That it is an object of the greatest and most vital importance to the inhabitants of this section of the State, and as such we will use our best efforts to promote it.

That the chairman appoint a committee of twenty to correspond with citizens of other portions of the State who may feel interested; to apply for a charter during the present session of the Legislature; to call meetings of the citizens, and take such other steps in furtherance of the objects of this meeting as they may deem expedient; and that said committee have authority to fill all vacancies that may occur. The following gentlemen compose the committee:—George Reeve, John Hamm, C. B. Godard, David Chambers, R. Stillwell, J. D. Fracker, J. Raguette, J. D. Wheeler, B. Van Horne, C. G. Wilson, G. A. Hall, S. A. Barker, George James, John Burwell, J. A. Turner, James Taylor, jr., W. Blocksom, H. J. Cox, J. S. Copeland, Solomon Sturges.

We look upon this movement as but the first step towards a railroad from Wheeling to St. Louis. Cannot the National Government be induced to make the western section at once, instead of appropriating money from year to year, in extending the national road? Should the latter be finished, and a parallel railroad be made by individual enterprise, it is clear that the post office department would be at the mercy of the railroad companies, and mail contracts monopolized at their own price.

The Company of the Iron Railroad from Paris to St. Germain has obtained from the military authorities permission to occupy troops on that undertaking.

The survey for the establishment of the Iron Railroad from Paris to Lille has been confided by the Administration of Bridges and Highways to M. Vallee. The plan is to make a communication between Paris and the Channel, at the ports of Calais, Boulogne, and Dunkirk; between Paris and Lille, Paris and Belgium, or Valenciennes; the Channel and Belgium, or between the ports of Calais, Boulogne, Dunkirk, and Valenciennes.—[London Courier.]

#### THE BRUSSELS AND ANTWERP RAILROAD.

—This is, perhaps, the Railroad of all others which has been constructed at the smallest expense; for the intervening country is almost a dead level; and it is at the same time amongst the most successful. For some time it has been completed from the capital to Malines, which is considerably more than half way, and was far advanced towards the Scheldt, when an order was received, forbidding its further progress, upon the ground that approaching, as it would,

so near the citadel of Antwerp, it might compromise the defences of that place. It now appears that the suggestion of this danger was first made by General Hano, of the French engineers.—[Ibid.]

From the following statement it will be seen that in 12 out of 13 Companies, Railroad Stocks are at a premium.

It will be so in this country.

**THAMES TUNNEL.**—We find in the London Mechanics' Magazine, for October, the following article in relation to this important work. We do not, however, learn from it the precise condition of the work, nor the prospect of its early completion, yet it contains other information in relation to the mode of performing the work, which may be of use to our readers, therefore we give it at length.

#### THAMES TUNNEL.

Mr. Editor,—A correspondent of yours, G. L. S., in No. 632 of the Mechanics' Magazine—a well-wisher evidently to the success of this great enterprise, condemning with justice the angry feelings expressed by some of your contributors against it, as attributable to personal motives, gladly and liberally offers a suggestion for the greater security of the work while in progress.

He says, that "to sustain the pressure of the superincumbent earth, during the excavation, he would drive 18 inches apart, horizontally, before the shield, and in a line with the top of the brickwork, iron rods, 1 inch thick and 8 feet long, and that a sheet of iron one quarter of an inch thick should then be laid over every two of the rods; thus he would form over the shield a covering (or ceiling,) which would be moved forward when a yard of tunnel is finished."

Prompted, as he is, by a friendly disposition, it is presumed that he will be gratified by learning what the provisions of the engineer actually are for sustaining the pressure of the superincumbent earth, while the excavation is being made. He should first know, however, what the scale of the operation is.

The excavation made for the Thames Tunnel is about 38 feet in width, and 22 feet 6 inches in height, presenting, therefore, an opening exceeding 850 feet. The whole of this excavation, including its two sides, which may be computed at 400 feet, is secured by means of a powerful apparatus designated the shield, as is also the roof of it, which measures 350 feet. At

full tide the weight of both earth and water, which constitute the *superincumbent pressure*, is not less than 700 tons. This is the portion that has formed the subject of your correspondent's solicitude.

The ceiling of the shield consists of 24 or 26 pieces of cast-iron, denominated staves, closely adjusted; and as they are sometimes made to relieve each other, and therefore subjected to an increased load, they are for greater strength made like inverted troughs of cast-iron; their breadth is 18 inches, the depth of their sides 7 inches, and their length 9 feet, independently of a tail of wrought-iron which overlays the brickwork. The edges in front are made sharp for entering the ground, and the external surfaces of the staves are planed very true. Similar staves are laid against the sides of the shield, all planed and equally well adjusted; each staff can be impelled singly as sheet piles are. Upon the whole the shield may be viewed as a coffer-dam, which, instead of being moved in a perpendicular direction, is placed and is impelled horizontally. The standing part of the shield consists of 12 parallel frames, all independent of each other.

The front of this vast excavation is protected in a different manner from that of the sides. It is panelled all over with small boards, each of which is 3 feet long and 6 inches wide. There are, therefore, upwards of 500 of these boards, technically called *polings*, for covering the whole face of the excavation. Every one of these *polings* is held in place, and secured by means of two hand-jacks or screws, abutting against the frames. There are, therefore, upwards of one thousand of these jacks in action for securing the face of the excavation, or, rather, for pressing against the ground with sufficient power to prevent any disruption of its various strata; for were the ground to be at all deranged, the pressure against the sides and front of the shield might soon increase to 2,500 or 3,000 tons, independently of that of the *superincumbent pressure*.

It is further to be remarked, that every successive side, which at its full head is 76 feet above the foot of the excavation, causes an incessant variation in that pressure tending to strain the hard strata, and to soften or knead the intervening soft ones; a fact quite unnoticed by projectors of plans, but which proved fatal to those who attempted the drift-way under the Thames in 1808. The pressure exerted against the front of the excavation by the agency of the shield, must therefore be uniformly kept at a maximum. The shield is advanced only 9 inches at a time, while the brick structure proceeds simultaneously.

Your correspondent, influenced as he is by the best motives, will have great satisfaction in learning, that the new shield is now being made without the necessity for modifying any law of hydraulics, or changing the nature of the ground, as has been too much the case with the various projectors who have sought to labor in the same field with the engineer of the Thames Tunnel.

Those who, without considering what must first be done under-ground, conceive that every difficulty would be obviated by

some particular covering laid on the bed of the river over the tunnel, such as timber-flooring, rafts, planking, roofing, plates of metal of any kind, tarpaulings, sails, leather, &c., loaded over with some great weight or not loaded at all, should further consider that they have, we are assured, upwards of 300 competitors for the same expedient, besides about 90 who, from motives of caution, have reserved the disclosure of their respective plans, until some remuneration should previously be provided.

It would be well if those who feel disposed to enter the List of Competitors, were first to consult the report of those miners who directed the attempts that were made and carried on with so much perseverance, between the years 1803 and 1808, with the ultimate object of opening a roadway under the Thames at Rotherhithe. These were miners (Cornishmen), engineers in that branch of the art, and, consequently, eminently qualified for the task in every respect; they were as sanguine, too, as any of the projectors of this day; and their excavation was limited, in the first place, to a simple driftway, the height of which was only 5 feet, the breadth 2 feet 6 inches at the top, and 3 feet at the bottom, forming, therefore, an excavation that was sixty times smaller than the excavation which has been made for the Thames Tunnel.—Diminutive, however, as this hole was when contrasted with that of the tunnel, the ground in the roof, though supported by substantial planking, gave way once in a fluid state, leaving an unsupported cavity over the roof of the driftway; still it held itself up; but a second accident of the same nature having occurred under a very high tide, the river broke the ground and entered the drift. In both cases it was the loose ground that forced its way first into the drift, and the river afterwards. The miners succeeded in filling the hole and in re-entering the drift, but the men could not continue the working; they were, according to the engineer's report, *driven out of it by the frequent bursts of sand and of water*, and it was acknowledged by him to be quite impracticable to proceed farther; so, after having probed the ground from underneath in many places, he concluded and reported that it was impossible to make an excavation of any size under the Thames. It never entered the head of this engineer, Mr. Trevethick, a remarkably ingenious and enterprising man, who conducted the operation to its final abandonment, that any covering, spread over the bottom of the river, would prevent the river filling his drift or a tunnel, at every tide, any more than it does the wells situated at many hundred yards from the river.

But he resorted to one expedient which he conceived would answer the emergency—one which, at any rate, demonstrates the intrepidity of this engineer. That is, in order to clear or pass through the place which had been filled up in closing the hole made by the breaking in of the river, he reduced the height of his drift from 5 feet to 3 feet. The men and the engineers, too, had therefore to work on their knees. Awful enough for such a task! Thus reduced, the area of the excavation of this

drift hardly exceeded the one hundredth part of that of the Thames Tunnel under corresponding circumstances.

Any one, can form an idea of a hole three feet square by looking at some garret window; but not so easily of a hole of a greater sectional area—for example, than the old House of Commons was.

It is no absurdity, Mr. Editor, to have succeeded in cutting out a hole of larger area than that hall, under a head of water as high as the Custom-house. The engineer who has made it never, however, professed being a miner, and never excluded miners, or any person interested professionally, from a sight of his works.

Let us farther notice here what Mr. Vazie said, who was not only the colleague of Mr. Trevethick, but the directing engineer, so far at least as the first 392 feet of that drift. In his letter, by way of appeal, to the proprietors, dated the 7th of December, 1807, relying, as he somewhat emphatically assumed it, "*on his professional information in the art of mining*," he stated, "*I am bold to say, that the only material difficulties with which we have had to contend have arisen from not having had the 50 horse steam-engine*," which had actually been purchased at his suggestion, and for which a 14-horse power had been substituted. He then adverts to "such an enterprise as that of working underneath a river so deep and so rapid as the Thames;" and boasts of having, nevertheless, "*succeeded in defiance of difficulties pronounced insurmountable by several engineers*." In another part of his letter he adds, "*I have been repeatedly, laboriously employed through the night, without taking any refreshment; and it was by no means unusual for me to remain 40 hours without rest; and for upwards of four years and a half I DID NOT SLEEP ONE NIGHT FROM THE WORKS—I am proud to state this, &c.*"

And all these arguments were from practical miners, who had but one miner and one carpenter to direct for making a shaft, begun on a diameter of 11 feet and completed at 8 feet; then carrying a driftway 5 feet in height, wherein not a single brick had been used.

Well may it be said, in respect to these great efforts towards making "convenient carriage-ways" quite water-proof.

"*Parturiens mone, nascitur ridiculus mus!*"

And now not a vestige can be traced of these vast labors.

But of the Thames Tunnel there is to be seen that which demonstrates the practicability of the plan of Mr. Brunel; and knowing that it has withstood the shock of two irruptions of the river, we have a sufficient security of the strength of the structure to assure us, that when completed it will endure—a lasting monument to national enterprise and zeal in promoting practical science. We may at this period repeat what his Grace the Duke of Wellington said of it in 1829, viz. "There is no work upon which the public interest of foreign nations has been more excited than it has been upon this tunnel;" and for a confirmation of the interest felt in our own country, we may refer your readers to the transactions in the House of Lords on the

2d of July, 1830, or of the House of Commons on the 24th of August last.

The reports of the former attempts and proceedings were published in 1809 by the Directors of the Company, when they made a public appeal for plans, offering a liberal reward for that which should be adopted. Fifty-three plans were obtained upon this appeal. The practical and scientific men, to whom they were referred for examination, concurred in opinion that none would answer for effecting the object on a proper scale. All farther attempt was, in consequence given up by the Company. A subsequent one, by working from above the river, proved equally unsuccessful.

Had your correspondent, Mr. Editor, in No. 605, been as solicitous for correctness as he is familiar with censure, he would not have felt himself called on to reprobate the Lords of the Treasury for having granted 250,000*l.* for the completion of an enterprise, as far completed as it is, which had received the fullest and most unequivocal approbation of his Grace the Duke of Wellington; no mean authority in such matters, more particularly when he had made himself familiar with those facts and circumstances already stated, but which is attempted to be denied by your correspondent. Nor is it other than natural that the late First Lord of the Treasury, Lord Althorp, should have been influenced in his decision by such sentiments as those publicly expressed by his Grace; as, for instance, "that the novelty of the work, the difficulty of ascertaining the nature of the bed of the river, and the accidents to which such a work was liable, tended to increase the expense of this great undertaking, yet that the work itself had cost only 120,000*l.*," that is, at the period alluded to by his Grace, viz. the 11th of June, 1828, which included, however, the expense of the first eruption and part of that of the second. But up to the 31st of December, 1828, when the works were entirely suspended and were closed, the cost of the works of the tunnel, including the shield, the steam-engine, and a powerful pumping-apparatus, was not more than 126,740*l.*, including both accidents, instead of 240,000*l.*, as your correspondent asserts it. Adverting farther to the benefit which will result from the work by uniting populous districts, his Grace added, that "*men cannot but see the great political, military, and commercial benefits that will be derived from the example of such a work, in this and in other countries; that the accidents which have occurred have demonstrated the practicability of the enterprise, and the genius and the ability of the engineer who has conducted it; they have also proved this, that the work of itself is excellent,*" &c.

This same correspondent remarks, that if the engineer had gone deeper with his tunnel, he would have avoided all difficulties and accidents. Now were he to refer to the reports of those engineers already alluded to, who operated between the years 1803 and 1808, he would find that they could not venture lower than 76 feet—which fact he will find to be confirmed by well-sinkers, who have opened wells near the river on the south side; and further, he may be informed, that eminent geologists

have warned Mr. Brunel of the probable effects of the 50 feet bed of blowing sand existing below that depth, and that they recommended him to keep as near as possible to the river as, perhaps, the enemy least to be dreaded.

Notwithstanding the public acknowledgment by the Duke of Wellington of the utility of the undertaking, and of the national honor which is attached to its completion, and notwithstanding the confidence which even the most disastrous accidents have inspired in the plan, by which one half, or nearly, of the undertaking has been realised and carried to the deepest part of the river, another correspondent or contributor of yours in No. 626, subscribing himself *Fanqui*, excited evidently by some grievous disappointment, protests against the enterprise, premising with an eulogical preface on the present member for Berkshire for his *manly exposure* in the House of Commons, of the pretended *manœuvres of the patrons of the Thames Tunnel in obtaining 270,000*l.* from the Government*. This critic unhesitatingly affirms, that the work, "*if ever finished, will only be a monument of folly and absurdity, because no vehicles of any description will ever use it as a means of transit.*" And he concludes by asking, "*who were the three most eminent engineers who had examined the plans of that scientific engineer, Mr. Brunel?*"

The charge of folly and stupidity certainly possesses some novelty to those who have been taught to value the benefit of good communications across a large navigable river, as the Thames is all the way from London Bridge to its mouth, where a permanent land communication cannot possibly be obtained. But to his question. It may be replied, that the Duke of Wellington was the first eminent engineer who, as far back as the year 1820, had examined the plan, and who from that time to the present has continued to manifest great interest in its application. The late Dr. Wollaston may be considered the second who expressed himself most favorable to the plan, and, it may be added, that the name of Wollaston stands the first in the enterprise, and most prominent, not only in the list of subscribers, but of proprietors to this day. In Mr. Donkin may be found the third, a gentleman who, from his practical knowledge of machinery, was fully competent to judge as to the efficiency of the shield after he had examined it.

I cannot but give a specific denial to the assertion, that the speculation was one of those which take their date from the eventful years of 1825 and 1826, because the first meeting, convened by the friends of the enterprise for organizing a company, took place in December, 1823, and the subscriptions were made up at a General Meeting in February, 1824. Should your correspondent not be satisfied with the testimonies already adduced, we may refer him to a leading article in the *Times*, at that period conducted by the present member for Berkshire. The article in question is dated 4th July, 1828; consequently, after the two eruptions of the river. It is therein said, that "the Thames Tunnel is an undertaking of the highest national importance and credit, and such as ought to meet with the

most ample public support in extricating it from its difficulties, and rendering it a proud monument of national utility and honor."

We may conclude, by informing your numerous readers and the public, that this national undertaking is in progress towards that anticipated achievement; and we may, on the best authority, add, that the front of the excavation has been worked and advanced several feet, and the ceiling of it raised in equal proportion; the whole having been done with perfect safety; and, moreover, that a considerable part of the old shield has been removed, and some portion of the new one has been put up. †.

For the Railroad Journal.

#### ON THE MANUFACTURE AND USE OF SOLUBLE GLASS.

Translated from "*Traité de Chimie appliquée aux Arts, par Mr. Dumas,*" by JAMES RENWICK, L. L. D., Prof. of Nat. Exp. Philosophy and Chemistry in Columbia College, New-York.

Soluble glass is a simple silicate of potassa or soda, which unites perfect solubility in boiling water to some of the general properties of common glass: besides, although the uses to which soluble glass is applied are very different from those of common glass, the study of it will furnish such exact and close analogies to other descriptions of glass, that we are compelled to include it in the groupe of chemical compounds which they form.

The discovery of soluble glass and of its uses, is due to a distinguished German chemist, from whom we derive all we have to say in relation to it. This glass, when dissolved in water, forms a liquid which may be applied to cloth or wood, for the purpose of rendering them *incombustible*. In fact, by the evaporation of the water in which it is dissolved, a layer of a substance capable of fusing when heated, is deposited on these bodies, which is capable of protecting them from the contact of air necessary for their combustion.

**Preparation.**—Soluble glass may be obtained by dissolving pure silica, obtained by precipitation, in a boiling solution of caustic potassa; but, this process being both inconvenient and costly, cannot be practised upon a large scale.

When sand and carbonate of potassa are heated together, the carbonic acid is never wholly driven off, except when the sand is in excess; but the whole of the carbonic acid may be expelled by adding powdered charcoal to the mixture, in such proportion that the carbonic acid of that part of the carbonate which is not decomposed may meet with a sufficient quantity of carbon to convert it into carbonic oxide. In this way the silica first forms a silicate in the proportions contained in common glass, and drives off the appropriate equivalent of carbonic acid; then, at a high heat the rest of the carbonate of potassa is decomposed by the carbon, the carbonic oxide escapes, and the potassa thus freed, either sublimes, or combines with the glass already formed.

In order to obtain soluble glass of good and uniform quality, certain precautions are necessary. The carbonate of potassa employed, must be purified.\* If it contain much

\* *Pearlash* being the purer form, we shall use its name in the practical part.

chloride of potassium, the product will not be entirely soluble in water, and a glutinous residuum will be left. In addition, the glass will be liable to effloresce. Sulphate of potassa does not produce any bad effect, because it is decomposed by the carbon, when the matter continues sufficiently long in fusion, but without this precaution the glass will contain sulphuret of potassium, which also has a tendency to efflorescence.

The sand must be pure, or at any rate must not contain any notable proportion of lime or alumina, for these earths render a part of the glass insoluble. A small portion of oxide of iron has no influence on the qualities of the glass.

The sand and carbonate of potassa (pearlash) are taken in the proportion of two of the latter to three of the former, and to 10 parts of pearlash and 15 of sand, 4 parts of charcoal are added; a less portion of charcoal must not be taken; on the contrary, if the form of potash employed be not sufficiently pure, a larger proportion of charcoal may be advantageously employed. This substance accelerates the fusion of the glass, and separates from it all the carbonic acid, of which there would otherwise remain a small quantity, which would have an injurious effect.

In other respects, the same precautions that are employed in the manufacture of common glass, are to be observed. The materials must be first well mixed, then fritted, and finally melted in a glass pot, until the mass becomes liquid and homogeneous. The melted matter is taken out of the pot with an iron ladle, and the pot is then filled with fresh *frit*.

Thirty pounds of pearlash, 45 of sand, and 12 lbs. of powdered charcoal may be taken for a charge; with this quantity the heat must be continued for 5 or 6 hours.

The crude glass thus obtained is usually full of air bubbles; it is as hard as common glass, of a blackish gray color, and transparent at the edges; sometimes it has a color approaching to whiteness, and at others is yellowish or reddish; these are indications that the quantity of charcoal has not been sufficient.

If it be exposed for some weeks to the air, it undergoes slight changes, which rather tend to improve, than injure its qualities. It attracts a little moisture from the air which slowly penetrates its mass, without changing its aggregation or its appearance; it merely cracks, and a slight efflorescence appears at its surface. If it be exposed to heat, after it have undergone this change, it swells up, owing to the escape of the aqueous matter it has absorbed.

In order to prepare it for solution in boiling water, it must be reduced to powder by stampers; if this were not done, it would dissolve too slowly. One part of glass requires from 4 to 5 of water for its solution.

The water is first heated to ebullition in an open boiler, the powdered glass is then added by degrees, and must be continually stirred, to prevent it from adhering to the bottom. The ebullition must be continued three or four hours, until no more glass is dissolved: the liquor will then have acquired the proper degree of concentration. If the

ebullition be checked before this state is attained, carbonic acid will be absorbed by the potassa from the air, which will produce an injurious effect; for the same reason, too great a quantity of water must not be employed, for during the long evaporation which will then become necessary, the carbonic acid of the water will readily combine with the potassa, and cause a precipitation of the silica.

When the liquor becomes too thick, before the whole of the glass is dissolved, boiling water must be added.

When the solution has acquired the consistence of syrop, and a density of 1.24 to 1.25, it is sufficiently concentrated and fit for use. It is then permitted to rest, in order that the insoluble parts may be deposited; while it is cooling, a coriaceous pellicle forms upon the surface, which after a time disappears of itself, or may be redissolved by depressing it in the liquor. This pellicle begins to appear during the ebullition, as the liquor approaches a state of concentration, and may even serve to indicate this state.

When the crude glass is of a proper composition, contains but few saline impurities, and no sulphuret of potassium, it may be treated in the way we have described. But if it contain any notable proportion of these substances, they must be separated before it is dissolved; this separation may be effected in the following manner. The powdered glass is exposed to the action of the air for three or four weeks, during which time it must be frequently stirred; if it run into lumps, which will happen in moist weather, they must be broken up. The glass, as we have stated, attracts moisture from the air, and the foreign substances either separate or effloresce. It then becomes easy to remove them from the glass. It is sprinkled with water, and frequently stirred. At the end of three hours the liquor is removed, it will then contain a part of all the saline impurities, and a little of the silicate of potassa; the powder is again to be washed with fresh water. Soluble glass thus treated, readily dissolves in boiling water, and the solution leaves nothing to be desired.

As soluble glass is employed in the liquid form alone, it is kept in this state for use. To preserve it, no particular care is necessary, as even after a long space of time it undergoes no perceptible change, if the solution have been properly prepared. The only precaution is not to allow air too free an access to it.

A similar product may be obtained by using a carbonate of soda instead of one of potassa. In this case, two parts of the soda of the shops is required for one of silica. This glass has the same properties as the other, but is more valuable in its uses. The solutions of these two kinds of glass may be mixed in any proportion whatever, and this mixture is more serviceable in some cases, than either of them separately.

**Properties.**—Soluble glass forms a viscid solution, which when concentrated becomes turbid and opalescent; it has an alkaline taste and reaction. The solution mixes in all proportions with water. When the density of the solution is 1.25, it contains nearly 28 per cent. of glass; if the

concentration be carried beyond this point, it becomes so viscid that it may be drawn out in threads like molten glass. Finally the liquor passes to the state of a vitreous mass, whose fracture is conchoidal; it then resembles common glass, except in hardness. When the solution is applied to other bodies, it dries rapidly at common temperatures, and forms a coat like a varnish.

Soluble glass when dried, does not undergo any perceptible change when exposed to the air, and attracts from it neither moisture nor carbonic acid; neither has the carbonic acid of the atmosphere any well marked action on the concentrated solution; but when a current of carbonic acid is passed through the solution, the glass is decomposed, and hydrate of silica deposited. But a weak solution becomes turbid on exposure to the air, and is after a time decomposed wholly. When the glass is impure, an efflorescence is formed after a while, which may be produced either by the carbonate and hyposulphite of potassa, or by chloride of potassium.

Soluble glass dissolves gradually without residuum in boiling water; but in cold water the solution is so slow as to have led to a belief that it does not dissolve at all. It however never becomes entirely insoluble, except when it contains a much larger proportion of silica, or when it is mixed with other bodies, such as the earths, metallic oxides, &c. with which double or triple salts are formed, as is the case in the common glasses.

Soluble glass which has been exposed to the air, and is afterwards submitted to the action of heat, swells and cracks at first, and melts with difficulty. It then loses about 12 per cent. of its weight. It therefore contains, even when solid, a considerable quantity of water, which it does not lose when simply dried by exposure to the air.

Alcohol precipitates it unaltered from its solution in water. When the solution is concentrated, but little alcohol is required for precipitation, and it need not be highly rectified. Pure soluble glass may therefore be easily obtained from an impure solution by the use of alcohol. The alcohol being added, the gelatinous precipitate is permitted to settle; the supernatant liquor is decanted, the precipitate collected, rapidly stirred after the addition of a little cold water, and subjected to pressure. In truth, however, this process is attended with some loss, for even cold water will rapidly dissolve the precipitated glass, in consequence of its minute division.

The acids decompose the solution of glass. They also act upon it when solid, separating the silica in the form of powder.

**Uses.**—The properties of soluble glass fit it for numerous and varied applications. It has been used in the theatre of Munich as a means of safety from fire.

All sorts of vegetable matter, wood, cotton, hemp, linen, paper, &c. are, as is well known, combustible; but in order that they shall burn, two conditions are requisite, an elevated temperature, and free contact of air, to furnish the oxygen necessary for their transformation into water and carbonic

acid. When once set on fire, their own combustion develops the heat necessary to keep up the chemical action, provided they be in contact with air. If deprived of such contact, and made red hot, they will, it is true, yield inflammable volatile products, but the carbon which is left will not burn, as it is deprived of air, and thus the combustion will stop of itself. Such is the part which all the fixed fusible salts are capable of performing, if they be in addition composed of substances incapable of yielding their oxygen at a low red heat, to either carbon or hydrogen. These salts melt as the vegetable matter becomes heated; they form upon it a coat impenetrable to the air, and either prevent altogether, or limit its combustion. The phosphate and borate of ammonia have such a character, but they are so readily soluble in cold water, as to be liable to objections which cannot be urged against soluble glass.

Although soluble glass is of itself a good preservative from fire, it fulfills the object better when it is mixed with another incombustible body in powder. In this case the solution of glass acts in the same manner as the oil of painters. The several coats have more body, become more solid, and more durable, and if the substance which is added be of proper quality, coagulate by the action of fire into a strongly adhesive crust. Clay, whiting, calcined bones, powdered glass, &c. may all be employed for this purpose; but we cannot yet say with certainty which of them is to be preferred. A mixture of clay and whiting, appears to be better than either used separately. Calcined bones form with soluble glass a very solid and adhesive mass. Litharge, which, with the glass, makes an easily fusible mixture, does not give a product fitted for coating wood, as the mixture contracts in drying; it therefore cracks, and is easily separated. Flint glass, and crude soluble glass, are excellent additions. The latter ought to be exposed to the air after it is pulverized, in order to attract moisture.—If it be mixed with the solution, and be then applied to any body whatever, it in a short time forms a coating as hard as stone, which if the glass be of good quality, is unalterable by exposure, and resists fire admirably.

The scoræ of iron and lead, felspar, fluor, may all be employed with soluble glass; but experience alone can decide which of these substances is best, and in what proportion they are to be employed. We should advise that the first coat should always be a simple solution of the glass; and that a similar solution be applied over coats composed of its mixture with other substances, particularly when such a coat is uneven, and rough.

The last named substances form a solid and durable coating, which suffers no change by exposure to the air, does not involve any great expense, and is readily applied. But in order that it may not fail, particular care is to be taken both in preparing and employing it.

In order to cover wood and other bodies with it, the solution must be made of a pure glass, for otherwise it would effloresce and finally fall off. However, a small degree of impurity is not injurious, although

after a few days a slight efflorescence will appear; this may be washed off by water, and will not show itself a second time.—When a durable covering is to be applied to wood, too strong a solution must not be employed at first, for in this case it will not be absorbed, will not displace the air from the pores, and in consequence will not adhere strongly. It is a good plan to rub the brush several times over the same place, and not to spread the coating too lightly. For the last coats a more concentrated solution may be employed, still it must not be too thick, and must be spread as evenly as possible. Each coat must be thoroughly dry before another is applied; and this will take in warm and dry weather at least 24 hours. After 2 hours the coat appears to be dry, but is still in a state to be softened by laying on another. The same inconvenience will then arise, which occurs when a thick coat of a concentrated solution is applied; the coat will crack, and does not adhere. This however is only the case when potassa is the base of the glass, for that formed from soda does not appear to crack.

In applying soluble glass to the woodwork of the theatre at Munich, 10 per cent. of yellow clay (*ochre*?) was added. After six months, the coat had suffered but little change; it was damaged only in a few places, where it had need of some repair. This arose from a short time only having been allowed for the preparation and application of the glass, and they were therefore done without proper attention.

When this mode is employed for preserving a theatre from fire, it is not enough to cover the woodwork, it is also necessary to preserve the scenery, which is still more exposed to danger. None of the methods yet proposed for this purpose appears as advantageous as soluble glass, for it does not act on vegetable matter, and completely fills up the spaces between the thread; it fixes itself in the web, in such a way that it cannot be separated, and increases the durability of the fabric. The firmness which it gives to stuffs does not injure them for use as curtains, because it does not prevent them from being easily rolled. So far as the painting of scenes is concerned, the glass forms a good ground for the colors. To prevent the changes which some colors, Prussian blue and lake for instance, might undergo from the alkaline matter, it will be necessary before painting to apply a coat of alum, and then one of whiting.

There is no great difficulty in applying soluble glass to cloths, still this operation is not so easy as might at first be imagined. It is not sufficient to coat or dip them in the solution; they still require after this operation to be subjected to pressure. This object might perhaps be best attained by passing them between rollers plunged in the solution. When a cloth which is only coated with soluble glass, is put into the fire, it will remain incandescent after it is taken out. This is not the case when it has been properly impregnated with the solution. A still better purpose is answered in this case, when litharge has been added to the solution. The stuff in drying yields

to the shrinking of the mixture, and becomes inseparable from it, which is the reverse of what happens when it is applied to wood. A single part of litharge in fine powder is sufficient for 14 parts of concentrated liquor.

Soluble glass is capable of many other applications, and particularly as a cement; for this use it is superior to all those which have hitherto been employed, for uniting broken glass, porcelain, &c.

It may be used in place of glue or isinglass in applying colors, although when employed by itself, it does not make a varnish which will preserve its transparency when in contact with air.

**EXTRAORDINARY INVENTION OF M. SUDRE.**—On Wednesday evening, M. Sudre delivered a lecture at the Mechanics' Institution, Liverpool, upon his system of universal musical language. The lecture room was crowded to excess. In order to remove all suspicion of collusion, the pupil was placed in the apparatus room of the Institution, and the door closed. A short phrase or sentence, in English or French, was then successively written by a number of ladies and gentlemen in different parts of the room, and placed on the lecture table, so as to be seen by the lecturer, and him only. M. Sudre having tuned his instrument, a fine toned violin, drew his bow sharply across it, so as to produce a chord, the signal of commencement, and then played, as it were, the sentence before him on the violin. This was no sooner done than the pupil brought from the adjoining room a black board, and M. Sudre having written in chalk upon the black diagram board of the Institution the sentence communicated, the boards were compared, and found to correspond. As M. Sudre keeps the method by which he is enabled to make this communication a secret, under the expectation of Government patronage, we can only speculate upon it. The sounds upon the violin seemed to be comprised within a scale of two octaves, and one sound appeared to be longer sustained than another. Though in this manner a musical alphabet might be composed, this cannot be the only means by which the sentence was conveyed, as we perceived (especially in the French) that the number of sounds were not equal to the number of letters. From this we are led to imagine that the system of M. Sudre must be a species of musical stenography, in which the vowels are occasionally omitted, and a simple sound used for a whole syllable or word.—[Liverpool Mercury.]

The President has recognized Paul Joaquim Figueira as Vice Consul of Portugal for the port of New York, and the ports of Connecticut, of New York, and of East Jersey. He has also recognized Dego Chalaron as Vice Consul of Portugal for the port of New Orleans and the State of Louisiana.

**THE WEATHER** is peculiar for the season. It has been mild and open, with a strong North East wind, blowing for two days. Last night it blew a gale. The zinc covering of the new building on the corner of Broad and Pearl streets, was, by the force of the wind, stripped from the roof and scattered about the streets.

**SUSPENSION BRIDGE AT FRIBOURG.**—The following account of the bridge at Fribourg, in Switzerland, was recently communicated to the French Academy by M. Arago:

Fribourg is built upon the left bank of the river Sarri. This little river has very steep banks on both sides. Their height above the bed is about 200 feet (French). Travellers, in going from Berne to Fribourg, were obliged to descend a hill of 200 feet, in order to reach a little wooden bridge thrown over the river, and immediately afterwards to ascend another hill of the same height, in order to reach the middle of the town. The passage through Fribourg, therefore, in a carriage, took up nearly an hour. These delays and difficulties seemed the necessary result of its position, when some enterprising individuals conceived the possibility of executing a suspension bridge which might unite the summits of the two high hills, between which the Sarri flows. The bridge was to pass over a great part of the town. The project seemed perfectly Utopian; nevertheless, the zeal of the citizens and magistrates induced them to submit the project to the attention of engineers in every country. The Cantonal Government gave the preference to the plan of M. Challey, of Lyons, and it has been executed under his immediate direction. The gates, by which we enter the bridge, are of the Doric order, and sixty feet high; the elevation of the arch is thirteen metres, the opening six metres; the breadth of the masonry fourteen metres, its thickness six metres. Although immense blocks of hard limestone rock from the Jura have alone been used, it has been deemed necessary to unite them by strong metallic cramps; 25,000 kilogrammes of iron have been used for this purpose. The breadth of the valley of the Sarri, at the spot where the bridge has been made, or the distance between the two interior faces of the gates thus raised upon both sides, or, in other words, the whole length of the bridge, is 517½ feet (French). It will easily be conceived there was some hesitation in attempting to pass this whole distance at one single cast or span, and the idea naturally suggested itself to M. Challey, of endeavoring to support it in the centre. But the difficulty of fixing solid piles at the height of 200 feet, especially in alluvial soil, made him relinquish it. The bridge, therefore, has only one span—a span of 265 metres. It is suspended according to principles, now generally acted upon, of four iron cables passing over the upper part of the two gates, each cable being composed of 1,200 iron wires, about three millimetres in diameter, and 347½ metres in length. As it would have been difficult to manage and to stretch these cables collectively, they were worked in separate parts. Their union was effected in the open air, the workmen being suspended, and, happily, without any accident having occurred. The four cables have been calculated to support 3,000,000 kilogrammes, equal to 60,000 ancient quintals. They are fastened, on the two banks, to the bottom of four pits excavated in the rock. In each pit, they are crossed by a vertical cylindrical shaft, which unites three massive superincumbent arches, and which are connected with infinite care with the surrounding rock. Lower down, they are let into very hard blocks of stone, of two cubic metres each. These cables, therefore, can only give way by tearing down the enormous weight of these several buildings, strengthened as they are, in every way, by adhesion to the rock. M. Challey began his work in 1832, assisted only by a person whom he brought with him from France, and employing merely the la-

borers of the country, men without experience, and who had never seen a suspension bridge. On the 15th October, 1834, fifteen pieces of artillery, drawn by forty-four horses, and surrounded by three hundred persons, passed the bridge, and went in a body, both to the middle and to the ends, without the least perceptible effect upon the efficiency of the bridge; and some days after, a procession, composed of the whole population of Fribourg and of the neighborhood, passed over with equal facility and confidence, although there never could have been less than eight hundred persons, many of them on foot, on the bridge at the same time. Since that, travellers and merchants have come in numbers to see this stupendous work. It is the intention of the engineer this month, (October, 1835,) to try the powers of the bridge by a weight of 100 kilogrammes to every square metre, and it may then be said, the Bridge of Fribourg has been executed in two years and a half.—The whole expense has been about 600,000 francs, or 25,000l. sterling. The only bridge which, for its dimensions, can be compared with that of M. Challey, is the Menai Bridge, built by the late Mr. Telford, and which joins the Isle of Anglesey to England. The largest ships can pass under this bridge at full sail. But the breadth of the Menai Bridge is only 167½ metres, 516 feet—consequently 301 feet less than that of Fribourg. The surface of Mr. Telford's bridge is about 32½ metres, or 100 feet above the level of the sea at high water. That of M. Challey is 51 metres, or 156 feet above the bed of the Sarri. M. Candolle has taken the city of Paris as a standard, by which to convey an idea of the magnitude of M. Challey's bridge. He supposes a bridge of only one single span, the length of which shall be equal to the railing of the Carousel, or to the distance between the two corresponding carriage entrances of the two galleries, the level of this bridge being somewhat lower than the height of the towers of Notre Dame, or eight metres higher than the column of the Place Vendôme, and you may thus have some notion of the height and length of the bridge at Fribourg.—[London Courier.]

**NEW LIQUOR GAUGE.**—A gauge, upon a very simple and excellent principle, which has just been introduced in the new gin palaces, has been invented by Mr. Fage, the hydrometer manufacturer, to show the quantity of liquor, in inches, contained in a cask or vat at any time. The gauge is a vertical glass tube of the same altitude as the cask or vat, and about the size of a large barometer tube, open at both ends. The lower end is securely let into a brass tube about 6 inches long, at right angles, with a valve, or stop-cock; this tube is fixed into the lower part of the side of the cask, as near the bottom as can be, similar to a cock. The glass tube is attached to a brass index about two inches wide, and of the same height as the glass tube, which is divided into inches; and the number of inches is engraved in figures reading from the bottom to the top. It is evident, when the valve at the foot of the glass tube is open, the liquor in the vat or cask will rise to the same height in the tube as it is in the vat; and, by means of the brass index, that it will show the number of inches of liquor in depth as there are in the vat or cask. It saves considerable labor and trouble to the excise officers; as, by calculating the quantity there is in each inch in depth in the cask when the gauge is first fixed, they can make their entries without the trouble of the gauging rule.—[Architectural Mag.]

AGRICULTURE, &c.

From the Farmers' Register.

ON THE USE OF LIME AS A MANURE.

By M. PUVIS.

Translated for the Farmers' Register from the *Annales de l'Agriculture Française*, of 1835.

(Continued.)

Surface Liming.

18. In Germany, where liming and marling, like most other agricultural improvements, have recently made great advances, besides the ordinary modes of application, lime is used as a surface dressing. They sprinkle over the rye, in the spring, a compost containing 8 to 10 hectolitres of lime to the hectare, fifteen days after having sown clover. Also on the clover of the preceding year, they apply lime in powder, which had been slaked in the water of the dunghill, the dose being less by one-half: the effect upon the clover and the following crop of wheat is very advantageous.

In Flanders, where they use lime mixed with ashes, it is particularly for the meadows, natural or artificial, and the application is then made on the surface.

Burning Lime.

19. The burning lime is done with wood, with pit coal, or with peat; in temporary kilns, or furnaces, in permanent, or in perpetual kilns. It is burned in many places most economically with coal, but it is not so good a manure as the lime burned with wood, because, as it seems, of the potash contained in the latter case. There are but few places in which peat is used for this purpose; however, in Prussia, they succeed with three-fourths peat, and one-fourth wood. It is, doubtless, a very economical process, and the *Societe d'Encouragement* has given in its transactions plans of peat kilns; but I know not whether the operators who received prizes for their use, have continued the practice.

The temporary kilns admit of the burning of a great quantity of lime; but the permanent kilns burn it with most economy of fuel. In the first, 5 quintals of wood, burn 4 quintals, or 1 ton, or 2½ hectolitres of lime—and in the others, the same quantity of wood will suffice for 6 quintals, or 3½ hectolitres. But in the permanent kilns such is the expense of construction and repairs, that they cannot be justified except when kept in frequent use. Coal burns from three to four times its bulk of lime—the shape of the kiln, the kind of limestone, and that of the coal, making the difference. Hydraulic lime is calcined more easily than the common [chaux grasse.] The egg-shaped kilns for coal seem to be preferable to the conical, which are more generally met with.

Precautions to be used in Liming.

20. Whatever may be the method adopted for using lime, it is essential that, as with all calcareous manures, it should be applied in powder, and not in a state like mortar—and upon the earth when not wet. Until the lime is covered up finally, all rain upon it ought to be avoided, which reduces it to paste, or to clots: and this injures its effect greatly, and even more than reasoning can explain. It ought not to be placed but upon soil, the surface mould of which drains itself naturally [by permitting the water to pass through.] On a marshy soil, unless the upper layer has been well dried, or in a very moist soil, from which the surface water does not sink or pass off easily, the properties of lime remain as locked up, and do not make themselves seen, until by new operations, the vegetable mould has been drained and put in healthy condition,

On an argillaceous and very humid soil, the use of marl, which is applied in great quantities, is preferable to that of lime, because that it can have a more powerful effect in giving the deficient health to the surface mould. On soil of this kind, a deep ploughing is a preliminary condition, essential to the success of either liming or marling: because in increasing the depth of the tilled soil, we increase also the means of putting the surface into healthy condition.

21. To secure the effect of lime on the first crop, it ought to be mixed with the soil some time before the sowing of the crop: however, if it is used in compost, it is sufficient that the compost may have been made a long time previously.

Lime, whether alone, or in compost, spread dry upon the soil, ought to be covered by a very shallow first ploughing, preceded by a slight harrowing, in order that the lime, in the course of tillage, may remain always, as much as possible, placed in the midst of the vegetable mould.

Lime, reduced to the smallest particles, tends to sink into the soil. It glides between small particles of sand and of clay, and descends below the sphere of the nutrition of plants, and stops under the ploughed layer of soil: and when there in abundance, it forms by its combinations a kind of floor, which arrests the sinking water, and greatly injures the crops. This is an inconvenience of lime applied in heavy doses, and is hastened by deep ploughing.

[To be continued.] -4

**TO THE LOVERS OF HONEY.**—The following directions in relation to the cultivation of bees, are given by Francis Kelsey, in his treatise on the "Description, Cultivation, and Management of the Honey Bee." Some of our readers will probably recollect Mr. Kelsey and his beautiful specimens of honey, at the Fair of the American Institute.

From this work, it will be seen that honey may be cultivated in a city, as elsewhere, and we have no doubt of it, to a considerable extent—by those who are not subjected to the inconvenience of moving annually. A suitable room may be prepared in the garret—so arranged as to afford space for the bees to increase, yet not to require them to swarm at all, and the honey taken out without disturbing them.

#### THE CULTIVATION OF BEES.

The cultivation of bees is by no means confined to the country, as many imagine; for they will find honey even in a paved city. They will search every yard, drain, garden, fruit tree, sugar and molasses cask, and it is but trifling for them to fly three or four miles, which they often do. It is probable they would cross water that far, if necessary; they would do well no doubt, if there was fifty to where there is but one. Every farmer might keep them; every citizen that has a small yard, might keep them; they can be kept in an upper room or loft by keeping the windows open; the roof of a building is not a bad place to keep them, in this case they need a short board on the top of each hive, with a stone or brick to keep it on, to keep the sun and water from the top of the hive. Several bushes should be erected upon the roof, or fastened to the sides of the window if they are kept in a room, for them to light upon when they swarm,

Directions for those that are unacquainted with bee-keeping. To purchase a hive of bees, place it where they are designed to stand, (this I would recommend to be done in the spring,) select a hive well stocked with bees, a two year old swarm would be advisable, little or no attention will be necessary until they begin to show indications of swarming, which will be in June, by laying out, i. e. in great clusters, outside of the hive, which they generally do ten or fifteen days before they swarm; when this is discovered, hives are to be prepared, such, if you please, as will hereafter be described as being the most advantageous. The bees are to be watched from 10 o'clock, A. M., until 3 P. M., which is the usual time in the day for them to swarm; when they swarm, they come out of the old hive with admirable and astonishing speed; they always light upon something, a bush, a bough, a tree, a post, a fence, a weed, or a plant, and sometimes, if it is windy, even upon a turf on the ground in a body; oftentimes as large as a water pail. If they are on the ground, set the hive over them, and they will soon go into it; if they are on a bush or a bough, cut it off carefully, holding it steady, carry it where you want the hive to stand, lay it upon the bottom board in front of the hive, they will go in speedily if the front be raised an inch; or if they light upon a fence or post, or the trunk of a tree, the hive may either be placed just above them, and they routed with a stick, or the hive placed beneath them bottom upwards, and they brushed off into it with a wing or broom, and then place it upright upon the bottom board, and as soon as the bees get settled, the hive should be let down to the bottom board, and placed where they are to stand, immediately before they go out to work; they ought not to be placed too near the old hive; swarms ought to be four feet apart. The second swarm may be expected in twelve days after the first; the third and fourth, if they swarm so much, within fifteen days, they sometimes swarm twice in one day, in consequence of hatching many young queens. The first swarm gives no previous symptoms, only by laying out; but after the first, you may have knowledge a day or two previous to their swarming, by listening in the evening near the hive; for there always may be heard, two and sometimes three days before swarming, a sharp, shrill sound, above, and entirely different from the humming of the common bees: this must be the young queens', of which the second and third swarms have a number; but the first swarm never has but one.

#### A DESCRIPTION OF PECULIAR HIVES.

As to hives, they ought to be so constructed that an addition can be put to them when it may be thought best. The plan I would recommend, both for profit and convenience, is this: have the hives all made of a breadth and square, say fifteen inches inside, and five or six in height; the common top board, which every hive is to have, must be fifteen inches square, and put within and flush with the top of the side boards; each is to have sixteen holes bored through it at equal distance from each other, i. e. four in a row each way, and not smaller than 3-4 nor larger than 5-4 of an inch, in one side, which is for the front; let, again, be cut in the bottom of each hive, for the bees to pass through, half an inch in depth and three inches in length, let two sticks the size of a man's thumb, be crowded or sprung in crossing each other from corner to corner; these are calculated to be set one up-

on the other, &c., as occasion may require; the top one must always have a top board eighteen or nineteen inches square fastened upon it with a large screw well tallowed to prevent rust. After a swarm is put into one of these hives, and has it nearly full, an additional hive is to be put beneath them without a top, except the one with holes through it. I do not recommend adding before the middle of July: an addition generally prevents their swarming for that reason, and I think they had better not swarm later, for it weakens the old stock too much. When they have got three such apartments full, or nearly full, the top may be taken off in the spring or fall with safety; in such cases it is most generally destitute of bees, but if it is not, puff a little smoke under it as you raise it, which will make them flee in a hurry. A top is to be screwed on in the place of it, or, if you choose, place another hive in the room of it, or otherwise you can put four small boxes in place of it, (which had better be covered with another hive.) They may be of wood or glass, or, if you choose, glass globes, bottles, bowls, jars, tumblers, &c.; they may be taken off at any time when they are full, and empty ones put on, or the holes covered.

#### GREAT PRODUCTS IN OHIO.

**Scioto Valley against the World.**—N. W. Thatcher, Esq., Secretary of the Agricultural Society, has handed us the following statement. It contains striking illustrations of the fertility of our soil, under skillful culture:

"One hundred and fifty-four bushels of corn, actual liberal measure, was produced the present season on one measured acre of ground, selected from a field of twelve acres, all equally as good, on the farm of Mr. George Renick of this vicinity. Mr. Felix Renick produced eighty-five and a half bushels of oats on an acre of ground; the seed of which he recently brought from England. The oats weigh about twelve pounds to the bushel more than the common oats of this country. Mr. Daniel Madeira of this place, raised in his garden, Cauliflowers of most extraordinary size, measuring from 29 to 33 inches in circumference, and weighing three pounds ten ounces in one solid head. And a stalk of corn, in the garden of Mr. Peter Douglass, produced eight good ears of corn!"—[Chillicothe Adv.]

"Premium Corn."—The premium was awarded to Mr. Asabel Renick, by the Agricultural Society of Piekaway county, on Monday last, for the best acre of corn. "One hundred and fifty-seven bushels and one peck!" Let those who can, beat that. We learn from the President of the Society, that the corn was planted in hills, a little more than three feet asunder, and received no more than the ordinary cultivation. So much for Darby Creek bottoms. We were gratified to observe an increased interest in the Society, manifested on the part of the farmers of the county."—[Circleville Herald.]

Estimating the cost of culture at \$15 per acre, and the price of corn at fifty cents per bushel, the growers of the above corn crops realized a net profit of \$62 per acre. We are not sure that the valley of the Hudson can compete with the valleys of the Scioto and Darby Creek, but we are sure that eighty bushels of corn per acre can be raised here, on proper corn ground, without extra expense; and this, at present prices, affords a profit of \$65 per acre,—[Cultivator.]

# GOVERNOR'S MESSAGE.

TO THE SENATE AND ASSEMBLY.

Fellow Citizens—

You are entrusted with the legislative authority of the people of this state, at an auspicious period in their affairs. Whatever is essential to the full enjoyment of civil and political rights, is placed within their reach by the free principles of their government. In the dealings of a kind Providence with them, they are permitted at this time to enjoy, in a liberal measure, the blessings which contribute to individual comfort and public prosperity. To our admirable form of government, to the wisdom of past legislation, and especially to the favorable regards of the Sovereign Ruler of Nations, ought we, in humble gratitude to Him, to ascribe our happy condition.

Until within a few days, wherever we directed our view throughout this flourishing commonwealth, we saw only gratifying evidences of unexampled prosperity; but we have now to lament that a portion of our constituents have been recently visited by a severe calamity. A conflagration, unprecedented in the history of this continent, and rarely exceeded in the past ages of the world, has consumed many millions of property, and laid in ruins an extensive district of our commercial metropolis. Destructive as this calamity has been to the fortunes of individuals, and extensive as its influence may be upon the general prosperity of the State, let us not yield to the desponding belief that we shall not soon recover from its effects. Though the sufferers have lost their property, they have not lost every thing. Their enterprising spirit and irrepressible energies still remain: their business relations are suspended, but not dissolved: their character as honorable merchants, and their capacity for business, fortunately are possessions beyond the reach of the devouring element. With these possessions, aided by the advantages which it is reasonable to expect will be liberally offered to them, they will soon resume their wonted pursuits under favorable auspices, and in a short time, it is believed, repair their losses.

Notwithstanding the disaster which has befallen this portion of your constituents, you enter on your legislative duties when the general condition of the state is unusually prosperous; but these duties are not, in my opinion, thereby rendered less responsible or less difficult to be performed. A high state of prosperity, is not generally less fruitful than a season of adversity, in developments which deserve the attention of the legislature. Many defects in existing laws and institutions are then disclosed, which it requires the profoundest wisdom to correct. Such a conjuncture as the present, seems to be a peculiarly appropriate time for reviewing the course of past legislation, and making needful reforms; for looking forward, and preparing our systems for the future exigencies of the state. Relieved, as you are, from the labor of guarding against external dangers, or repressing civil commotions, your minds are left free to mark the progress, & consider the tendency, of our present establishments: to check the operation of evil principles before they have produced their bitter fruits, and to give a right direction and efficient action to principles of an opposite character.

It is to be feared that the constitutional provisions relative to our judiciary system, will not permit it to be so expanded as to meet the public wants. The vast increase of business in our higher courts has demonstrated their inadequacy, under their present organization, to discharge the onerous duties devolved on them; and something must therefore be done for the public relief. If this relief cannot be obtained by the modification of the existing courts, or an enlargement of the system on the present basis, then your attention should be directed towards procuring an amendment of the constitution.—The importance of providing for a speedy administration of the laws, and the urgent demands for a system every way competent to this object, will, I trust, ensure some decided action on this subject at the present session of the legislature.

In a government like ours, which emanates from the people, where the entire administration in all its various branches is conducted for their benefit and subject to their constant supervision and control, and where the safety and the perpetuity of all its political institutions depend upon their virtue and intelligence, no other subject can be equal in importance to that of public instruction, and none should so earnestly engage the attention of the legislature. Ignorance, with all the moral evils of which it is the prolific source, brings with it also numerous political evils, dangerous to the welfare of the state. It should be the anxious care of the legislature to eradicate these evils by removing the causes of them. This can be done effectually only by diffusing instruction generally among the people. Although much remains here to be done in this respect, the past efforts of legislation upon the subject merit high commendation. Much has been already accomplished for the cause of popular education. A large fund has been dedicated to this object, and our common school system is established on right principles. But this is one of those subjects for which all cannot be done that is required, without a powerful co-operation on the part of the people in their individual capacity. The providing

of funds for education, is an indispensable means for attaining the end; but it is not education. The wisest system that can be devised, cannot be executed without human agency. The difficulty in the case arises, I fear, from the fact that the benefits of general education can only be fully appreciated by those who are educated themselves. Those parents who are so unfortunate as not to be properly educated, and those whose condition requires them to employ their time and their efforts to gain the means of subsistence, do not, in many instances, sufficiently value the importance of education. Yet it is for their children, in common with all others, that the common school system is designed; and until its blessings are made to reach them, it will not be what it ought to be. If parents generally were sensible of the inestimable advantages they were procuring for their children by educating them, I am sure the efforts and contributions which are required to give full efficiency to our present system, would not be withheld. If I have rightly apprehended the indications of public opinion on this subject, a more auspicious season is approaching.

At this time, a much larger number of individuals than heretofore, are exerting their energies and contributing their means to impress the public mind with the importance of making our system of popular instruction effective in diffusing its benefits to all the children in the state. I anticipate much good from the prevalence of the sentiment, that the efforts of individuals must co-operate with the public authorities, to ensure success to any system of general education.

The press, that powerful engine in moving and controlling public opinion, is at this time, and much more so than formerly, directed to this subject, and it will undoubtedly have a salutary influence in advancing the cause of popular instruction.

The difficulty of supplying the district schools with competent teachers, has presented the greatest obstacle to the complete success of our system. A beginning has been made with a view to the removal of this obstacle. A separate department for the instruction of common school teachers has been established in one of the principal academies in each of the eight senate districts of the state, and public funds have been appropriated towards the support of these departments.—That this measure cannot be otherwise than highly beneficial to the common schools, may be confidently anticipated.

The law of the last session of the legislature, authorizing the inhabitants of each school district to impose a very light tax upon themselves for the purpose of providing a district library, is a measure well calculated to aid the cause of public instruction. I have not the means of knowing to what extent the districts have acted under it, but I sincerely hope that they are generally disposed to avail themselves of its wholesome provisions, and to commence establishments from which it is reasonable to expect beneficial results. Although this matter is left at the option of the several districts, yet the usefulness of such libraries, is sufficiently obvious to induce a belief that the law will have nearly the same effect as if it had been made obligatory on them to use the powers it confers.

Reports have been received for the year, 1834, by the Superintendent of Common Schools, from all the towns and the wards in the State. The number of school districts therein is ten thousand one hundred and thirty two. And the number of children five hundred and forty-three thousand and eighty-five, of whom five hundred and forty-one thousand four hundred and one have received instruction in the common schools. The public monies distributed to these schools amount to three hundred and twelve thousand one hundred and eighty-one dollars and twenty cents, including the one hundred thousand dollars derived from the income of the common school fund, and eighteen thousand six hundred and twenty dollars and ninety-two cents from local funds belonging to particular towns. The residue was raised by taxation on the property of the several towns and cities. A further sum of about four hundred and twenty thousand dollars was also paid by the inhabitants of the several districts. The aggregate amount of these sums, seven hundred and thirty-two thousand one hundred and eighty-one dollars and twenty cents (except a few thousand dollars expended in the city of New York upon school houses), was paid for teachers' wages. The whole amount of expenditures on account of common schools in this state for the year 1834, was at least one million three hundred thousand dollars.

Our academies and seminaries of learning are objects of great public interest, and worthy of the fostering care of Government; particularly so in regard to their agency in supplying to some extent the demand for common school teachers. There are many of high character and extensive usefulness, that are not under the supervision of the regents of the University, and consequently receive no aid from the literature fund.—I have not the means of ascertaining their number or their particular condition. There are sixty-eight academies subject to the visitation of the regents, and all but five of them made reports to the regents last year. The whole number of students receiving instruction in them at the date of these reports, was five thousand two hundred and ninety-six; the amount of tuition paid by them in 1834, was seventy-three thousand four

hundred and seventy-two dollars; and the real and personal property owned by these academies, including philosophical apparatus and libraries, amounted to five hundred and seventy-one thousand four hundred and seventy dollars.

There are seven colleges in this state, including the two medical institutions. Hamilton and Geneva colleges have had to struggle with difficulties for want of a more liberal endowment. The plan of the University of the city of New York, is, in many respects, similar to that of the most extensive universities on the continent of Europe, and contains arrangements for imparting instruction on many other subjects than those usually embraced in the ordinary collegiate course.—This institution is in its infancy, and many parts of its plan are not yet put in execution. It is, however, reasonable to hope that it will in due time fulfil the expectations of its founders. Columbia and Union colleges are both in a very flourishing condition.

Our penitentiaries continue to present very favorable results. The number of convicts in the Auburn prison is a very little larger than that of the last year. The number in the Mount Pleasant Prison has been very much reduced. On the thirtieth day of September last, it was forty-five less than on that day in the previous year, and the number received in 1835, from the counties that are required to send their convicts to this prison, was also forty-five less than was sent from the same counties in 1834. The whole number of convicts in both prisons on the first of December last, was one thousand four hundred and fifty-one.

The earnings and profits of the Auburn prison, during the last fiscal year, exceeds the expenses for general support and ordinary repairs, seven thousand three hundred and eighty-eight dollars and thirty eight cents. Of this sum, there have been expended on buildings and for machinery, in payment of fees to sheriffs for transporting convicts, under the act in relation to the State Prisons, passed at the last session, and for expenditures on a few other unusual objects, five thousand six hundred and fifty-six dollars and ten cents.—The officers of the Auburn prison estimate the sheriff's fees, which by that law are to be paid from the earnings of the convicts, at more than seven thousand dollars, and they are apprehensive that this additional charge upon, and the diminution of, the income, which will result from that law, will make an appropriation from the treasury to some extent necessary to defray its expenses.

Creditable as this statement is to those who have managed this institution, the prison at Mount Pleasant presents still more successful results. The moneys received for the earnings of the convicts in this establishment, including ten thousand dollars for work done for the State, for which payment has not been required, amount to eighty-five thousand one hundred and sixty-four dollars and forty-two cents, and the expenses for general support have been only fifty-six thousand three hundred and sixty-one dollars and six cents. It should be recollected that this prison defrays the expense of supporting the female convicts. After deducting the sum paid for this object, and for building materials, which together amount to five thousand five hundred and ninety-six dollars and twenty nine cents, the surplus earnings of this prison for the past year are twenty-three thousand two hundred and seven dollars and seven cents.

When the old contracts shall have expired, the new direction which the law of the last legislature gives to the labor of the convicts, will undoubtedly cause a considerable reduction in the amount of their earnings.—The officers of these prisons have, as by this law they are required to do, given their attention to the subject of introducing the manufacture of silk, but not much has yet been done towards effecting it. The expense attending the introduction of this kind of manufacture, will be so great, that I fear it cannot be done in a manner to ensure its success, without an appropriation for this object from the treasury. In relation to the Auburn prison, such an appropriation will be indispensable.—The officers of both prisons have, pursuant to the late law, begun to cultivate the mulberry, and have already about fifteen hundred trees growing on the state property adjacent to the prisons.

With the exception of the varioloid, which prevailed among the prisoners at Mount Pleasant for a short time last spring, the inmates of both prisons have enjoyed more than a usual degree of health, and have conducted themselves in an orderly manner.

I am fully persuaded that if better means were provided for punishing petty offenders in a proper manner, the number of crimes which are punishable by labor and confinement in the state prisons, would be greatly diminished; and with a view to effect this desirable object, I have repeatedly called the attention of the Legislature to the condition of our county jails.—Referring you to the remarks in my former messages on this subject, I again present it as worthy of your favorable consideration.

In the course of the present year, the laws making most of the appropriations to the two institutions for instructing the Deaf and Dumb, will expire. The charter of the asylum located in the city of N. York, will also expire in 1837, and that of the Central Asylum in a few years thereafter. I presume that it will not be within the views of the legislature to withdraw

the public patronage from this unfortunate class of our fellow citizens, or to suffer these valuable institutions to go out of existence. They have both fulfilled public expectation. The New York Institution is, in all respects, one of the best in the country. The approaching events to which I have alluded, render it necessary for you to give your attention to this subject at the present session. The policy of consolidating them, and making a single institution, adequate to the wants of the whole state, is respectfully submitted to your consideration.

With the fullest conviction that it is the duty of the government, to give to the insane, and especially to the insane poor, for whom as yet comparatively little has been done, the benefit of a proper institution, I most earnestly call your attention to the subject. In my annual message of 1834, I presented my views of the strong claims which this forlorn class of our fellow beings have upon the legislature for its assistance, and the great public and individual advantages which would result from a well regulated institution of this kind. To these views I refer you, with an urgent request that you will not suffer this session to pass, without satisfying a claim supported by so many and such powerful considerations.

It is now ten years since the discontinuance of the State tax. The General Fund then accumulated, with an inconsiderable income from other sources, besides paying two hundred and ninety-four thousand one hundred and eleven dollars and sixty-nine cents for the support of the lateral canals, and many large appropriations for other objects, has sustained the ordinary expenses of the government far beyond the period anticipated when the state tax was discontinued. This fund is now not only exhausted, but the state at the end of the last fiscal year, was in debt to other funds for the current expenses of the treasury, four hundred and six thousand and sixty-eight dollars & ninety seven cents.

In consequence of the recent amendment of the constitution, the income from auction and salt duties, after July next, will be paid into the treasury of the state to the use of the General Fund. If this fund were relieved from the support of the lateral canals, the receipts of the present year, in the opinion of the Comptroller, would be nearly adequate to the ordinary expenses of the government. The amount required for those canals, increased as it will be by the Chenango canal, will, I hope, be provided by some system of finance applicable to internal improvements generally; but if it should not be, I trust the ability of the treasury to meet these demands will not be supplied by the generally and justly condemned policy of borrowing money for that purpose, without, at the same time, providing a revenue sufficient ultimately to pay both the interest and principal of the debt.

The productive capital of the Common School Fund is one million eight hundred and seventy-five thousand one hundred and ninety-one dollars and seventy-one cents. Its income during the last fiscal year was one hundred and thirty-four thousand dollars. This income exceeds the estimated amount about twenty-six thousand dollars, and is considerably larger than it will be in future years. It will not, however, fall in any year much short of one hundred and ten thousand dollars. The distribution to the common schools may therefore be permanently raised to one hundred and ten thousand dollars annually, as soon as an apportionment can be made under the census recently taken.

The Literature Fund is two hundred and sixty-five thousand three hundred and forty-two dollars and eighty-seven cents, and produced an income last year of fifteen thousand seven hundred and thirty-six dollars and twenty-five cents.

The Bank Fund at the close of the fiscal year, was four hundred and seven thousand and ninety-four dollars and ninety-nine cents, and the payment due on the first instant will add to it one hundred and thirty thousand dollars.

The great importance of internal improvements is conceded by all; and the claims of the several parts of the state to participate in them, so far as they afford capabilities and offer advantages, cannot in justice and fairness be contested. I have repeatedly expressed my anxious desire to have the state progress in the career which has been so honorable and advantageous to it.—I have described the character of such works as, in my opinion, should be executed by the state, and directed the attention of your immediate predecessors to those particular undertakings which seem to be most earnestly desired by our constituents. For a full exposition of my views on all these points, I take the liberty to refer you to my previous communications to the legislature. I have not been without apprehensions, and I still entertain them, that internal improvements cannot be long prosecuted on an extensive scale, unless sustained by a wise system of finance. No new work can be executed without using the public credit, and however high that credit is at this time, it cannot be liberally used and long upheld without some financial arrangement that will inspire confidence at home and abroad. If we look at the works undertaken in this State since the commencement of the Erie and Champlain canals, or at those in other States, as furnishing the means of an enlightened judgment, we ought not to conclude that any great enterprise of this kind now in contemplation, will, at its completion, or within any short period there-

after, yield a sufficient revenue to defray the expenses of its maintenance, and pay the interest on the debt contracted on its account; nor is it necessary, according to the views I have heretofore presented on this subject, that such a result should be anticipated from any proposed public work to warrant your favorable action upon it. But a work that does not produce such a result will impose a burden which must be sooner or later discharged. To suppose that your constituents require you to engage in the construction of any public work, and at the same time decline to bear that portion of the burden of it which fairly belongs to them, is not doing justice to their good sense and intelligence.

I have heretofore expressed, and I deem it appropriate now to repeat, my regret that we have departed from the wise system in relation to finance under which our first public works were commenced, to the evident detriment of the general cause of internal improvements. The improvident practice of borrowing money without providing available funds for paying the interest, has already been carried to a point beyond which it cannot be pushed without producing serious mischief. That this practice has not yet impaired our public credit, is to be ascribed to the fact that heretofore the treasury has been in a situation to meet the demand for the interest without relying, to any considerable extent, on loans for that purpose; but that can be done no longer. On a part of the debt already contracted for internal improvements, the interest can only be paid by new loans, unless you resort to taxes of some kind; and such will most certainly be the case in relation to any additional debt you may create. The surplus revenues of the Erie and Champlain canals cannot be applied to this object within nine years, and after the expiration of that period only to a limited amount, if at all, for several years thereafter. These revenues are by the constitutional pledge, placed wholly beyond your reach until the year 1845, and all but the annual sum of three hundred thousand dollars is already appropriated during twelve years at least, for the enlargement of the Erie and Champlain canals.

This condition of things is not presented for the purpose of discouraging your efforts in the cause of internal improvement, but because it is a difficulty that inseparably belongs to the subject, and if not removed, will greatly impede our onward course.

The suggestion, that we are to discontinue this system, will not, I confidently trust, be heard from any quarter. Yet very few, I should hope, would advocate the reckless policy of contracting a debt, even for such an object, and constantly and rapidly accumulating it by loans to pay the interest. I am sure our credit would ere long sink under such a policy. If at a period of unusual prosperity, with resources most abundant and unincumbered, with no demand for extraordinary expenditures on objects which can never be productive, the people are unwilling to submit to any burden whatever for the purpose of providing even for the interest on the debt they are creating for substantial and enduring improvements, conferring on themselves direct and incidental advantages, what good reason can be given to those who have capital to loan, to induce them to believe, that our successors will promptly pay, not only what is properly left for them to pay, but also that which in justice and good faith should have been paid by us?—Can we with propriety ask capitalists to put faith in our contracts on the ground that the people in some future age will do what we decline to do, burden their resources to pay the interest which in our time we suffered to accumulate on the debt we had contracted?—Can we claim the continuance of public confidence on the assumption that a future generation will take better care of public credit than we are willing to do?

There is another point of view in which this policy appears to me to be extremely objectionable. It violates the great principle of justice in regard to future generations. I must not be understood to maintain the position that the people of the present day should furnish the means of reimbursing the loans that they may make for the purpose of internal improvements. These improvements will be left for the benefit of future ages, and I see no injustice in transmitting to them, the obligation to contribute a fair proportion towards the expenses. But we also derive great and immediate benefits from such works; and a portion of these expenses, should, therefore, be paid by us. If we borrow the money to defray them, and also borrow to pay the interest on the debt, we take the benefits without the burden. On the supposition that a public work does not for 15 years produce an income more than sufficient to keep it in repair, the debt contracted for its construction will at the end of that period be doubled, if it be increased by loans to pay the interest. Those who at that time have the benefit of such an improvement, will take it encumbered with a debt amounting to twice the sum that it would cost them to make it for themselves. We should reflect, that if we prosecute public works with vigor, we shall not accomplish all that is to be done. Each successive age will doubtless be an age of improvement in this respect, and the people of each will be required to contribute from their means to such objects. I fear we are not sufficiently conscious of the peculiar felicity of our own times, if we indulge in anticipations that those which are to succeed will, like the present, be wholly exempted from the foreign wars and domestic troubles which wither the energies and impair the resources of nations; that Providence will

be as liberal in its bounties to our successors as it has been to us; and that our civil and political institutions will, at all times hereafter, exert the same benign influence as they do now upon the public welfare. We cannot reasonably expect that any future generation will be more willing or more able than we are to bear public burdens, and I can conceive of no reasons that can justify us in transferring to them any part of the share of such burdens that should be borne by us.

If you concur in these views, you will regard it as your duty to provide a certain revenue that will at least be sufficient to pay the interest on the public debt already created, for which no provision is now made, and also on any additional debt you may authorize to be contracted. This can be done by augmenting the receipts into the treasury, so as to leave a surplus, after paying the ordinary expenses of the government and other appropriations, fully equal to the amount that may be required to pay the deficit of interest on the public debt; or by an explicit and effective appropriation of the future surplus revenues of the Erie and Champlain canals. The occasion seems now to require you to determine the grave question, whether the surplus revenues of these canals shall or shall not be appropriated to the support of other works of internal improvement. The Oswego, Cayuga and Seneca, the Crooked Lake, and Chemung canals, are all in full operation; and we have already drawn from the public treasury for their support, two hundred and ninety-four thousand one hundred and eleven dollars and sixty-nine cents, beyond the income received from them.—The Chenango canal will much increase the amount required from the treasury for the support of the lateral canals. The treasury is entirely exhausted, and you are therefore required to provide for the support of these canals, and to pay the interest on the debt contracted on their account for the present year, more than one hundred thousand dollars. If you do not, and I trust that you will not, provide for the payment of this sum by a further loan, and thereby increase the existing debt without pledging a revenue sufficient to pay it, you will then have only the alternative of levying a tax of some description to raise a sufficient revenue for this purpose, or of borrowing on the specific pledge of the surplus revenue from the Erie and Champlain canals. If the sum of three hundred thousand dollars of the surplus revenue from these canals, reserved by the law providing for the enlargement of the Erie canal, is left without such a pledge, there will be no certainty that it will be applied to pay the debt, which must, without taxation, be accumulated to support the other canals. It therefore seems to be necessary that you should determine, at this present session, the question of appropriating the surplus revenues of the Erie and Champlain canals to sustain and carry forward other works of internal improvement.

It is estimated by the Commissioners of the Canal Fund, that the deficit in the revenues of the lateral canals, will be one hundred and twelve thousand three hundred and twenty-eight dollars and thirty-seven cents for the present year. The same state of things will exist in subsequent years, and the amount of the deficit will be increased with the increase of debt for new works. I am persuaded that the dictates of an enlightened policy will urge the establishment of a distinct system of finance applicable to this subject, whereby a fund will be provided adequate in amount at least to satisfy the demands for interest on the debts that are and may be created, and all other expenses, except the reimbursement of the principal borrowed for the construction of public works. I particularly recommend the adoption of such a system, because I am convinced it will have a salutary influence on the general cause of internal improvement.

I have received a communication from the president of the Board of Directors of the New York and Erie Railroad Company, together with other documents relative to the extensive and useful enterprise they have undertaken. As the principal documents have been heretofore printed, I presume they are in the possession of the members of the legislature; and I have not therefore transmitted them with the accompanying letter of the president, to which I refer you for information respecting the proceedings and views of this company. It appears by the communications I have received, that the subscriptions to the stock already obtained amount to two millions three hundred and eighty-two thousand one hundred dollars; and that more than twenty-seven thousand dollars had been expended, principally for surveys, previous to the first of October last. Since that time, forty and a half miles have been put under contracts about fourteen per cent below the estimated expense, and the company entertain a confident opinion that the whole work will be executed and put in operation for six millions of dollars. The magnitude of the undertaking, the public benefits it will confer, and the deep interest felt by the inhabitants of the section of the state through which this extensive line of communication is to pass, will induce the company again to ask the aid of the legislature. The mode and amount of the assistance which the state ought to contribute towards the accomplishment of this work, will deserve your mature consideration, uninfluenced by any other views than such as are inspired by a comprehensive regard for the public good.

The canals continue to increase in productiveness. The total amount of tolls collected on them during the

year ending the 30th of September, was one million four hundred eighty-five thousand seven hundred and seventy-five dollars and nine cents. The income from the tolls and all other sources of revenue during the year, was one million nine hundred and sixty-two thousand five hundred and twenty-three dollars and twelve cents. The disbursements for repairs and collection of tolls for the same time, were five hundred and five thousand seven hundred and eighty-eight dollars and seventy-eight cents, and the entire expenses on all accounts, including the interest of the canal debts, amounted to eight hundred and thirty thousand three hundred and fifty-three dollars and sixteen cents.

In January, 1833, the debt created for the construction of the Erie and Champlain canals, was a little more than seven millions, a part of which was reimbursable at the pleasure of the government after July, 1837, and the residue after July, 1845. At that time the Commissioners of the Canal Fund began to purchase and cancel the stock of this debt. On the 30th of September last they had paid out for this purpose, nearly three millions of dollars, and yet had a surplus of the fund on hand amounting to three millions four hundred and six thousand eight hundred and nine dollars and seventy-two cents. By the first day of July next, the surplus will be quite sufficient to extinguish that debt, which is now four millions three hundred and forty-nine thousand six hundred and thirty-four dollars and eighty-five cents. If such should be the case, the income derived from auction and salt duties, will then be transferred by the recent amendment of the Constitution, from the Canal fund to the treasury for general purposes.

Pursuant to the directions of the law, passed at the late session of the legislature, the Canal Board has settled the plan for enlarging the Erie canal. According to this plan, the canal is to be made seven feet deep and seventy feet wide on the surface of the water. All improvements now required on the line of this canal, will be made with reference to its enlargement. Measures have already been taken to change the location of the aqueduct across the Genesee River at Rochester, and to construct the new one on this principle.—When this canal is enlarged according to the proposed plan, it is presumed that boats carrying one hundred tons of freight will pass on it with facility. No very accurate estimate has yet been made of the expense of this work; but it will probably exceed twelve millions of dollars, including damages for individual property which must be taken for that purpose.

The amount of the appropriation for this work will not probably much exceed one million dollars annually; it will not, therefore, be completed in less than twelve years.

Notwithstanding the business has increased on the Oswego, Cayuga and Seneca, Crooked Lake and Chemung canals, the tolls have not been sufficient to defray the expenses of collection and repairs, and pay the interest on the debts contracted for their construction. For the year ending on the 30th September, the deficiency in the revenue to meet these expenses, was forty-four thousand four hundred and sixty-four dollars and thirty-nine cents, which has been paid out of the treasury.

Unforeseen difficulties have retarded the work on the line of the Chenango canal, and apprehensions are entertained that it will not be entirely completed during the next season. Great care has been taken to construct this work so as to give it permanence, and the expense of it will probably exceed the present appropriations, which amount to one million eight hundred and sixty thousand dollars. No fund whatever, except the premium on the loans, has been provided for the payment of interest on this debt, that can be available till after July, 1845. The premium on the first loan of one million of dollars has been already exhausted, and that which may be received on the loan of eight hundred and sixty thousand dollars, will not probably be sufficient to pay the interest on that portion of the debt for more than two years. You ought, therefore to make provision for paying the interest on the million loan, and eventually on that of eight hundred and sixty thousand dollars. It is now anticipated that after the canal is completed and in full operation, the necessity of such a provision will be superseded.

Goods usually arrive through the Canal at Buffalo in the spring, destined for the country farther west, several days before the lower part of Lake Erie is clear of ice. This occasions delay in forwarding them on, and has a tendency to divert the trade to the west from our channel of communication. It is worthy of your consideration, whether the inconvenience and injury arising from this cause is not of sufficient magnitude to make it a measure of good policy to extend our present line of internal communication from Buffalo to some point on the shore of Lake Erie, where the lake would be likely to be free from ice as early in the spring as the navigation of the canal may be opened.

I have heretofore expressed my decided opinion against the policy of legislating on subjects that needlessly interfere with the ordinary pursuits of our fellow citizens. These pursuits should be left wholly unembarrassed by any regulations whatsoever, except such as are obviously required to prevent abuses and promote some manifest public good. I recommend that you should entirely abstain from granting charter privileges, to be used in transacting such kinds of business as are

prosecuted by individuals, and which can be conducted as well by them as by incorporated companies. The association of capital for such objects with corporate privileges, subjects individuals engaged in the same or similar pursuits, to an unfair and injurious competition.

In regard to incorporations of a more general character, the public necessities and the public interest will indicate your duties, and beyond what these considerations demand, you will not, I presume, feel any inclination to multiply them.

In my last annual message, I communicated my views in relation to corporations which have a connection with, and an influence on, our currency, and so far as those views apply to the present condition of the state, I wish to be considered as presenting them again to the legislature. You will be solicited to add an immense amount to the banking capital of the state, at the present session. Notices have been already published of intended applications for ninety-three new banks, with capitals, including the increase to those of the existing banks, to the amount of more than fifty-seven millions of dollars. It is said, and I doubt not, generally believed, that the present banks are unable to afford the necessary accommodations which the increased and rapidly increasing commerce and business of the country demand. Before you undertake to supply this want of capital by legislation, you will doubtless satisfy yourselves of its actual extent, and investigate its real causes. If it shall be found, as I think it will, to arise, in a great measure, from a state of things that cannot probably long endure, and ought not to be upheld by you, so far, at least, you will be bound to withhold the proposed aid. There can be no mistake as to the fact, and it should not pass unnoticed, that an unregulated spirit of speculation has within the last year prevailed to an unprecedented extent. Our citizens, who have been influenced by this spirit, have not confined their operations to objects within our own state. They have made large investments in other sections of the Union. These operations have required something more than the use of our circulating credits. The amount of capital that has been thus transferred from this state, to others, cannot be ascertained with any degree of accuracy, but it must be very great. These transactions, large as they have been, bear no comparison to the enormous speculations in stocks, and in real property, within our own state.

The vacant land in and about several of our cities and villages, have risen in many instances, several hundred per cent. and large quantities of them have been sold at prices which seem to me to have been produced more by the competition of speculation, than any real demand resulting from the increase of our population and actual prosperity. That the sudden rise in the price of these lands, is ascribed to the true cause, is evident from the conceded fact, that most of them have been purchased, not for the purpose of being occupied by the buyers, but to be again put in market, and sold at still higher prices. No estimate can be made of the amount of these transactions; but a conjecture may be formed as to the extent of the sales, from the fact that a single auctioneer in the city of New York sold real estate during the year ending on the 30th September last, to the amount of more than twenty millions of dollars; and the character of these sales is indicated by the further fact that about eleven millions of this property was sold on the bid made by or for the owners. It is proper that I should remark, that the speculations in real property in this state, have not been confined to city and village lots, but have extended to farms and wild lands.

I presume it will not be denied that a very considerable portion of capital has been devoted to these speculations in lands and stocks. I have deemed it necessary to allude to these transactions, with a view to lay open the true causes of the alleged deficiency of capital to subserve the purposes of commerce, manufactures, and the other pursuits of the productive classes of our fellow citizens, deeming it very important that these causes should be well considered before you attempt to apply a remedy—particularly such a remedy as is asked for—an unexampled extension of our credit system.

It cannot, I think, be denied that a large amount of capital has been sent out of the State to subserve the purposes of foreign speculation. This is undoubtedly one cause of the want of sufficient capital to transact our ordinary business. It is not less true, I apprehend, that the existing banks have, to some extent at least, lessened their ability to accommodate persons employed in regular business pursuits, by affording assistance to those who are embarked in these speculations.—This is another cause of the present want of banking facilities. But the main cause of this want, which now presses so severely on our fellow citizens, is less obvious, but not the less entitled to your consideration. The passion for speculation pervades to an extent heretofore unknown, not only among capitalists, but among merchants and traders. The funds of these capitalists have been withdrawn to some extent from situations in which they afforded accommodations to business men, and they have consequently been obliged to press upon the banks to supply this deficiency in their means. Merchants and others, have abstracted from their business a portion of their capital, and devoted it to speculations in stocks and lands, and have then resorted to the banks for increased accommoda-

tion. To these causes I ascribe most of the embarrassment now felt for the want of sufficient bank facilities to conduct successfully our ordinary business concerns. The proposed remedy, judging from the applications, is to double the present number of banks, and nearly to treble the amount of banking capital. Before you apply this remedy, in whole or in part, you ought to be well satisfied that it will remove the difficulty, and that the use of it will not leave us in a worse condition than we are at present.

If the passion for speculation has engrossed the pecuniary resources of the state to such an extent as to interfere with the strong claims that commerce and trade have upon them, is it not to be apprehended that it will appropriate to itself a large portion of any additional accommodations you may provide for those and other branches of business? If I rightly apprehend its character, it will not be likely to abate while it can find means for its gratification. I am well aware that this spirit of speculation cannot be restrained by direct legislation; but you should be careful to avoid encouraging or sustaining it even incidentally by any measures you may deem it expedient to adopt for the purpose of repairing the injuries it has done to the business concerns of the state.

I do not doubt that the increase of commerce and manufactures among us has rendered more bank accommodations desirable, and that this cause has had very considerable influence in producing the numerous applications about to be presented to you; but I cannot give my assent to the proposition which the advocates for banks will urge as the rule for your action on this subject, that the increase of banks should be in proportion to the increase of business. This proposition assumes that whatever be the situation of the country as to the quantity of actual capital, the agency of banks is equally necessary, and the amount of accommodations required from them must be in proportion to its business transactions. It certainly cannot be true that a large capital, requires the same accommodations from banks as one doing an equal amount of business with little or no capital.

What is true in relation to individuals, thus differently situated, must be true as to the whole community at distinct periods, when circumstances have made a like difference in its conditions. When banks were first established in this state, and for some time thereafter, the amount of monied capital was small compared with the quantity of business that required the use of it. Banks were then chartered, not merely for performing the ordinary functions of such institutions—to furnish the public with a proper medium of circulation convertible into specie—safe places for deposits—facilities in transmitting funds to concentrate the floating capital at home, invite its introduction from abroad, and place it in a situation where it could be used more efficiently for the purposes of trade. Since that period we have had a long course of prosperity, our wealth has rapidly increased, and a capital has flowed in upon us from other countries. I cannot, therefore, adopt the conclusion, that there is at this day the same disproportion between the amount of monied capital and the quantity of business, that existed when the policy of the banking system was first adopted, and for some time thereafter. The conclusion would, in my judgment, be somewhat derogatory to the capacity of our citizens for business, and present their condition as much less prosperous than it is confidently believed to be. But if fortunately this conclusion be correct—if we have not in fact the amount of capital that our apparent condition implies—if our gigantic business concerns are principally sustained and carried on by a system of credit, and the system is wholly dependant for its stability upon our banking institutions, you will act on this subject under a fearful responsibility. A material error on your part would probably lead to results fatal to our general prosperity. All measures which you may adopt, affecting the currency or public credit, should regard particular interests as far only as they are subservient to the general good; they should be such as not merely to afford accommodations and facilities in prosperous times, but to secure confidence in our monied institutions in the most trying season of adversity, and enable them to withstand the rude shocks of pressure and panic. It is true that our present institutions have been severely tried, and they sustained themselves in a most alarming crisis; but, if their number had been much larger than it was, and credit and circulation proportionably extended, it is by no means certain that such would have been the result.

We have had too much and too recent experience of the sensitiveness of public credit and public confidence in monied affairs, not to have learned many useful lessons on this subject, and it is the part of wisdom to profit by them. We know how many and what slight causes affect them. The credit which sustains our paper currency rests on the belief that the banks have the ability to redeem in specie their bills in circulation, whenever payments are demanded. On the other hand, the banks must have confidence in the borrowers to make prompt payment, or they will withhold their usual accommodations, and a derangement in business will be the necessary consequence. Their ability as debtors depends on their security as creditors. In times of prosperity, there is a mutual confidence; there will then be a demand for large accommodations, and banks will grant them to the full extent allowed by their charters. A

change of times, or even what appears a capriciousness in public opinion, brings with it a mutual suspicion, and its concomitant evil, a pecuniary pressure. Overtrading at home and abroad; an unusual expansion of our credit system; over issues of paper currency; extravagant speculations; and extensive gambling in stocks—speedily followed by reactions; a derangement in our circulating medium; embarrassment in trade; and numerous bankruptcies, are the inevitable consequences.—The impulse and accelerated movements given to our business in the first stages of this progress, are a very inadequate compensation for the many evils which attend its termination.

We do not want more banks to supply us with a paper currency, for we have enough of that already; more would not make it better, and might make it worse. It can scarcely be said we want an increase of them for places of deposit; for we have now all that are required for that purpose. New banks do not of themselves, in any case, create capital; and under our present circumstances, they would not, as I apprehend, be the means of introducing any considerable amount of foreign capital. I therefore consider the multiplication of them to be a measure of very questionable policy, in regard to the general and permanent welfare of the state.

After a due consideration of the views I have now presented, and those in my former messages, as well as others that your own reflections will suggest, adverse to the multiplication of banks, and a large increase of banking capital, if you should come to the conclusion that these objections are outweighed or overruled by arguments of a different character, and that the public interest requires you to give your sanction to any of the numerous applications for new banks, or the increase of the capital of those now chartered, I indulge the hope that the number will be very small. I cannot believe that you will give heed to any of these applications, so far as they are supported only by the expected advantages to be conferred on individuals in the distribution of the stock, or by the accommodations they may afford to carry on new speculations, and sustain the factitious state of things, resulting from past transactions of this character. Nor will you will look, I presume, with much more favor on those applications which are urged, not so much on the ground of a want of facilities to conduct the present business, as on account of the agency it is assumed such institutions will have in creating new business.

These considerations being laid aside, if the actual demands of business—I mean only such business as banking facilities are most appropriately designed to subserve—shall prevail with you to extend these accommodations, you will, I trust, be careful to dispense them only to places where these demands are most important.

I perceive, among the numerous applications of this nature to be presented to you, several from the banks of the city of New York for an increase of their capital. In addition to the common and more general considerations which will apply with more or less force to all the applications for augmenting the amount of banking capital, a somewhat peculiar reason will be urged in favor of those emanating from these institutions. The branch of the U. S. Bank, in the city of New York, will cease its operations as a bank, on the fourth March next, and there will be due to it eight or nine millions of dollars. If the payment of this large sum should be immediately exacted, it would undoubtedly produce very considerable embarrassment. The banks in New York are so extended that they will not be in a situation to afford such accommodations to the debtors of the branch, as will counteract the effects of a sudden call on them for the payment of this large debt. If the evils which may ensue from this emergency are likely to be of such a character as to require any action from you to mitigate them, one, more suited to the circumstances of the case would be preferable to the permanent increase of the capital of these institutions. If the Bank of the United States should be disposed to do with the branch in the city of New York, what it has done in relation to most of its branches—transfer the debt; such banks as may unite together to purchase this debt, or such as should take any portion of it, might have their ability temporarily enlarged so as to enable them to do so, and gradually call it in, without withdrawing any considerable part of the accommodations which they now extend to their customers.

I am aware that a considerable increase of banking capital is contemplated by many as among the means of alleviating the distress resulting from the calamitous visitation which has recently befallen the city of New York. It is due, alike to the numerous sufferers upon whom this visitation has fallen with severity, and to the citizens of the whole State, whose interests are more or less affected by it, that you should act promptly and efficiently in administering relief, and I do not doubt you will do it in the largest measure and most effectual way

you can devise; but this is an event which I trust will produce only temporary embarrassments, and it should not therefore, be permitted to change, in an essential manner, a general system of policy in relation to our currency. So far as I am made acquainted with the views of the inhabitants of that city, they mean to rely in this great and pressing emergency mainly on their own resources—resources, which in themselves exceed those of almost any State in our confederacy. The real and personal property in the city of New York, according to the valuation of last year, exceeds two hundred and eighteen millions of dollars; it is more than double what it was in 1825, and more than two-thirds of the amount of the valuation of all the taxable property of the whole State, including that city, ten years ago. This immense wealth must give the city of N. York undoubted credit wherever and whenever she may choose to use it; yet if the objects to be attained by resorting to it in the present crisis, could be more effectually accomplished, or, in any respect, accelerated by adding to it the credit of the State, this should be done without hesitation.—When the individual resources of a large number of our fellow citizens are impaired by a sudden devastation, or exposed to imminent peril by a strangely adverse course of events, to such a degree as to threaten injurious consequences to the general welfare, it is unquestionably the duty of the Government to put in requisition the resources of the State to sustain them. The great losses which have fallen on the Insurance Companies in that city, have suspended the operations of most of them, and new incorporations of this description will probably be wanted. The public interest requires that their capitals should be large, their risks widely distributed, and their proceedings subjected to an occasional examination by persons to be selected by the court of chancery, or commissioners appointed by the legislature.

The act passed at the last session of the Legislature, prohibiting the circulation of small bills, has begun to operate on the currency, and promises to produce all the beneficial results that were anticipated. This law was intended to effect a substitution of specie for the bills to be withdrawn from circulation. It was distinctly foreseen, that, in the process of coming to this result, a public inconvenience would be felt before it could be completely effected, and that the specie required for this desirable purpose would be principally drawn from the banks. It was also foreseen that the banks would be curtailed in their profits, by being deprived of the privilege of furnishing the public with a medium of circulation composed almost entirely of their paper. If these effects had not been produced, the law would not have operated as it was expected; and yet these effects have, I believe, called forth some opposition to it. If the state of our currency required, as I am convinced it did, the application of such a measure to establish it on a firm basis, it is very unreasonable to complain of the inconvenience necessarily resulting from it. This inconvenience, so far as it is felt by the public, will soon pass away. The notion that the public will be subjected to a permanent embarrassment by the suppression of small bills, derives no support from reason or experience. The circulation of bank bills below the denomination of five dollars, has been for a long time, prohibited in several of the States, and, as I believe, without any considerable inconvenience. There is no country in the world where such a circulation would be more desirable than in England, and none where more mature consideration has been given to its currency; and there it has been deemed wise to suppress the circulation of all bank paper below a note of five pounds, which is more than twenty-two dollars of our currency. As I do not anticipate that any proposition to repeal or modify this law will be favorably received by you, I do not consider it my duty to enlarge upon its merits on this occasion.

As somewhat connected with the currency and the business transactions of the State, I deem it to be my imperative duty to invite your attention to a practice, which, carried to the excess it lately has been, is, in my opinion, very pernicious to the well being of the State. Dealing in stocks, so far as it assumes the character of stock-jobbing, is a species of gambling, and produces most of the evils, public and private, which usually result from the indulgence of that unfortunate propensity. If this kind of speculation has not recently been conducted in a manner altogether new, it certainly has been carried to an extent altogether unprecedented. Immense quantities of stock have been sold by those

who had it not, under a contract to be fulfilled at some future period, and purchased by those who did not expect a delivery of it. The results of these transactions are adjusted without the delivery of the stock, and the loss and gain ascertained by its market value on the day stipulated for performing the contract. This is no more nor less than a wager upon the price of particular stocks on a specified future day. It is worse than wagers upon ordinary contingencies, because the event may be controlled by artifice and management, and the persons concerned are too strongly tempted to resort to them to subserve their interest. It is true, our present laws regard these transactions with disfavor. Such contracts are not only declared void, but the persons who have gained by them may be compelled to refund to the losing party or his representatives; yet they are constantly made, and in most instances faithfully executed. The extent to which this species of gambling has been lately carried, and its injurious effects upon many individuals who have embarked in it, have given it the character and consequences of a public evil; and your official situation imposes on you, in my opinion, the duty to suppress it. I recommend to you to lay this practice under a strong legal interdiction—an interdiction that shall be rendered effective by pains and penalties.

I am informed, that in some instances, companies incorporated by the authority of other States, have established offices in the city of New York, at which deposits are received, and notes or bills are discounted. This, in my opinion, is in contravention of the laws of this State. I invite your attention to the subject, and if there can be any reasonable doubt as to the adequacy of the existing laws to suppress this proceeding, I recommend that you should make such further provisions in relation to it as the case may require.

The law passed at the last session of the Legislature, relative to unclaimed dividends and deposits, operates unfavorably, it is believed, on the savings banks. The inconveniences and hazards to which the publications required by that law will expose these institutions, have induced some of them to defer a compliance with it until the subject could be again brought before the legislature, with a view to procure some modification of that part of it which relates to them. I have received a communication from the trustees of the Bank of Savings in the city of New York, (which I herewith transmit to you,) showing what they apprehend would be the consequences to that institution, of making the publication required of them. The views therein presented, appear to be well worthy of your consideration; and I recommend a revision of this law, and such modification of it in relation to savings banks as will remove the injurious effects resulting from its provisions.

I regret that the constant violation of the law to suppress the sale of lottery tickets in this State, requires me again to remind the Legislature that it is a duty imposed on them by the constitution to suppress this traffic. The evils resulting from it, as well as the constitutional injunction, urge this subject upon your attention, and I hope some additional means will be devised to give complete efficiency to the existing law against this species of gambling.

The result of the enumeration of the people of this State, taken during the last year, will be soon presented to you by the Secretary of State.—Although this result is not accurately known, enough however is known to assure us that our population has greatly increased. The constitution enjoins upon you, as a duty to be performed at this session, the reorganization of the senate districts, making them, in regard to the number of inhabitants contained in each, as nearly equal as may be. You are also required, by the same authority, to apportion, at this session, the members of Assembly among the several counties of the State, according to their population.

The last Legislature directed the Secretary of State to prepare and submit to you, a plan for the geological survey of this State. His report will be laid before you at an early day. I am persuaded that a careful geological examination of this State will not only open new sources of wealth, and accelerate the development of those already known to exist, but, by these means, will greatly augment the productive industry of our citizens. In several of the States, surveys of this description have been already made, and in others they are in progress. From the partial examinations which have been made of this State, there is reason to believe

that it is at least equal to any other in the Union, in the richness and variety of its resources.

The development of these resources would be more or less beneficial to the various interests of the State, but it would be more directly advantageous to that interest which I doubt not you will feel a peculiar desire to advance—the interest of agriculture—by ascertaining the mineralogical composition of soils in different sections of our territory, and thereby causing such an improvement in the mode of cultivating them, as will best reward the labors of husbandry. In addition to further discoveries in relation to salt springs, beds of gypsum, and quarries of marble and stone fitted for architectural purposes, it may be ascertained by a critical and scientific examination, that the coal formations discovered in the neighboring districts of Pennsylvania, which have contributed so much to the wealth of that enterprising State, extend within our own boundaries. In the progress of these researches in a field greatly diversified in its geological character, and heretofore but imperfectly explored, science will doubtless receive acquisitions of no ordinary value. Under whatever aspect the subject is viewed, it deserves your attention; and I feel confident that such an undertaking would amply repay all the expenses incurred in its execution.

The events of the past year, here and elsewhere, have continued to exhibit the importance of a well organized militia, both for the defence of public liberty and for the protection of private rights. During the recent disastrous fire in the city of New-York, its patriotic militia voluntarily placed themselves under the civil authorities, and rendered, as on many former occasions, the most essential services to their fellow citizens.

A new edition of the act relating to the militia and public defence, including the amendments of the last session, has been published during the past year, and the principal part distributed, pursuant to the directions of the Legislature.

The provisions of the law passed at the last session, to secure a more faithful performance of duty, on the part of general officers and their staffs, have resulted, generally, in the beneficial consequences, which were anticipated. In several brigades, owing to this and other causes, an increased degree of discipline and military knowledge has been exhibited, and the most commendable exertions have been made, not without success, to maintain the respectability and efficiency of the present system. Experience, however, constantly admonishes us of the intility, if not of the impracticability, of attempting to sustain, in a proper manner, an organization suited to the exigencies of the country nearly half a century ago. The great change that has since taken place in its external relations and internal condition, has rendered the system they adopted unnecessarily burdensome. Satisfied of this fact, I have constantly indulged the hope that Congress would take measures to adapt the system to the present circumstances of the country. I have now the pleasure to state, that the President of the U. S. and the Secretary of War have recently presented such views to Congress on this subject, as warrant the belief that the desired modification will be effected at the present session of that body.

The annual report of the Adjutant-General, which will shortly be laid before the Legislature, exhibits the present numerical force of the militia of this State, at one hundred and ninety-three thousand five hundred and seventy-two.

At the request of the President of the United States, I submit to you the proposition to cede to the general government the possessory right to so much of the land belonging to the State of New York upon Staten Island, and heretofore used for military purposes, as may be necessary to construct and maintain proper defences for the protection of the harbor of New York. I recommend that you should authorize the sale to the United States of so much as they may desire to possess for the proposed object, and cede to them such a concurrent jurisdiction over it, as is usually granted in like cases.

Having concluded my remarks on the subjects in which our constituents have an immediate and exclusive interest, my sense of duty will not permit me to abstain from presenting to you, at this time, some considerations arising from our federal relations.

This State is a member of a community of republics, subject in many things to one general government, and bound together in political ties that must not be sundered. This relation gives us rights essential to our well-being, and imposes upon us duties equally essential to the well being of our

sister States. As we value the immense advantages that spring from this Union, so we should cultivate the feelings and interests that give it strength, and abstain from all practices that tend to its dissolution. A few individuals in the middle and eastern States, acting on mistaken motives of moral and religious duty, or some less justifiable principle, and disregarding the obligations which they owe to their respective governments, have embarked in an enterprise for abolishing domestic slavery in the southern and southwestern States. Their proceedings have caused much mischief in those States, and have not been entirely harmless in our own. They have acquired too much importance, by the evils which have already resulted from them, and by the magnitude and number of those which are likely to follow if they are further persisted in, to justify me in passing them without notice. These proceedings have not only found no favor with a vast majority of our constituents, but they have been generally reprobated. The public indignation which they have awakened, has broken over the restraints of law, and led to dangerous tumults and commotions, which, I regret to say, were not in all instances suppressed without the interposition of the military power. If we consider the excitement which already exists among our fellow citizens on this subject, and their increasing repugnance to the abolition cause, we have great reason to fear that further efforts to sustain it will be attended, even in our own State, with still more dangerous disturbances of the public peace.

In our commercial metropolis, the abolitionists have established one of their principal magazines, from which they have sent their missiles of annoyance into the slave holding States. The impression produced in those States, that this proceeding was encouraged by a portion of the business men of the city of New York, or at least was not sufficiently discountenanced by them, threatened injurious consequences to our commerce. A proposition was made for an extensive voluntary association in the south, to suspend business intercourse with our citizens. A regard for the character of our State, for the public interest, for the preservation of peace among our citizens, as well as a due respect for the obligations created by our political institutions and relations, calls upon us to do what may be done, consistently with the great principles of civil liberty, to put an end to the evils which the abolitionists are bringing upon us and the whole country. With whatever disfavor we may view the institution of domestic slavery, we ought not to overlook the very formidable difficulties of abolishing it, or give countenance to any scheme for accomplishing this object, in violation of the solemn guarantees we are under not to interfere with this institution as it exists in other States.

Domestic slavery existed in almost every State when the federal union was formed. Its character was as well understood then as it is now. The men who founded the general government had as much philanthropy, and as just an appreciation of moral and religious duty, and knew as well what was due to the cause of human rights as the present generation; yet so great did they regard the difficulties of abolishing slavery, and so disastrous to the public welfare would be, as they apprehended, any intermeddling with it in the respective States, except by the citizens and civil authorities thereof, that they delegated to Congress no power to act on this subject, further than to prohibit the importation of slaves after the year 1807; but they recognized the right of the several States to continue slavery, without interference, by obliging them to deliver up to each other all fugitive slaves.—They left the right to abolish slavery where only it could be safely left—with the respective States wherein slavery existed.

The State of New York had this right, and although the difficulties and dangers of exercising it, by reason of the small number of slaves in proportion to the whole population, were trivial compared with those which would attend the exercise of it in the Southern States, where this number is proportionably large; yet slavery was not finally abolished here until 1827. We were left to come to this result in our own time and manner, without any molestation or interference from any other State. I am very sure that any intermeddling with us in this matter, by the citizens of other States, would not have accelerated our measures, and might have proved mischievous. Such services, if they had been tendered, would have been rejected as useless, and regarded as an invasion of our rights.

If we view the labors of the abolitionists in the calm light of reason, undisturbed by any morbid sympathy, and uninfluenced by the spirit of fanaticism—if we look at their object, connected as it must be with the means they are using to attain it—if we regard the utter improbability of their ever reaching the end by the use of these means, and the certain consequences which must result from pushing forward their efforts in the present direction, we must, I think, characterize their schemes as visionary and pernicious.

Their avowed object is to abolish slavery in the southern and southwestern States; and their means thus far have been confined to the organization of societies among us, and to publications of various kinds on the subject of slavery, which are regarded throughout these States as libels on their citizens, and provocatives to insurrection among their slaves. So far as their proceedings are designed to operate upon this State, we may inquire what end or object they have in view. It cannot be to abolish slavery here, for it does not exist among us. Is it to convince the people of this State that slavery is an evil? Such is now the universal sentiment, and no man can be found among us who entertains a thought of returning to our former condition in this respect. If the abolitionists design to enlist our passions in their cause, such a course would be worse than useless, unless it had reference to some subsequent action. If it is expected in this manner to influence the action of Congress, then they are aiming at an usurpation of power. Legislation by Congress would be a violation of the Constitution by which that body exists, and to support which every member of it is bound by the solemn sanction of an oath. The powers of Congress cannot be enlarged so as to bring the subject of slavery within its cognizance, without the consent of the slave holding States. The proceedings of the abolitionists have rendered their object in this respect absolutely unattainable. They have already excited such a feeling in all those States, that a proposition so to enlarge the powers of Congress, would be instantly rejected by each with indignation. If their operations here are to inflame the fanatical zeal of emissaries, and instigate them to go on missions to the slave-holding States, there to distribute abolition publications and to promulgate abolition doctrines, their success in this enterprise is foretold by the fate of the deluded men who have preceded them. The moment they pass the borders of those States, and begin their labors, they violate the laws of the jurisdiction they have invaded, and incur the penalty of death or other ignominious punishment. I can conceive no other object that the abolitionists can have in view, so far as they propose to operate here, but to embark the people of this State, under the sanction of the civil authority, or with its connivance, in a crusade against the slave-holding States, for the purpose of forcing abolition upon them by violence and blood-shed. If such a mad project as this could be contemplated for a single moment as a possible thing, every one must see that the first step towards its accomplishment, would be the end of our confederacy, and the beginning of a civil war.

So far, therefore, as it respects the people of this State, or any action that can emanate from them, I can discover no one good that has resulted, or can be reasonably expected to result, from the proceedings of the abolitionists; but the train of evils which must necessarily attend their onward movements, is in number and magnitude most appalling.

Those devastations which in the course of Providence are sometimes permitted to visit populous and opulent cities, suddenly prostrating monuments of art and sweeping away the vast accumulations of years of patient and well directed industry—great and severe as we now feel them to be—are small indeed compared with the ruin and desolation which would attend the subversion of our federal government, and the progress of a civil and a servile war, spreading its ravages through half the States of this confederacy. Such are the fatal issues to which, in the judgment of our Southern brethren, the abolition efforts tend; and the recent indications of insurrectionary movements among the colored population of the slave-holding States, show that these fears are not entirely imaginary.

As all the schemes of the abolitionists are professedly prosecuted with particular reference to results to be produced in the slave-holding States, it is proper that we should inquire into the manner in which they design to bring about these results. Is it expected to operate on the slave population, and by their own immediate agency to effect their

emancipation? This can only be done by violence. The very first act in this scheme of abolition, which is carried on under the guise of religion, morality, and love for mankind, would open with insurrection, massacre, and a servile war, in which, if the slaves triumph, their masters must be the victims. Throughout those States, such is generally believed to be the deliberate design of the abolitionists. That their measures tend to such disastrous results, cannot, I think, be denied; but that the authors of them clearly foresee these results, and recklessly push on to them, willing to participate in such crimes, and to meet the fearful responsibility they would incur, I am not prepared to believe. So far as reason prevails among these deluded men, they will undoubtedly deny that this mode of effecting their object is embraced within their plan of operation. It is more charitable to presume that they mean to stop short of this bloody catastrophe; that they are willing to spread dire alarm among the white population of those States, with a view to make them feel that life, property and all human comforts are insecure where domestic slavery prevails, and by these means to aggravate its evils, that they will be led by the mere pressure of them to emancipate their slaves. Such a mode of attempting to effect this object, is characterized alike by folly and wickedness. To suppose that such means will conduce to such an end, betrays a lamentable ignorance of the universal laws of human action. If the slave owners ever concur in any plan for the abolition of slavery, it must arise from a better motive than fear. They will secure themselves from danger by acting on the objects from which it is apprehended—not by emancipation, but by multiplying safeguards, by increasing restraints, by preventing intercourse as far as practicable among the slave population, by withholding from them all moral and religious instruction, and by every conceivable means of making them harmless machines. To satisfy ourselves that such will be the consequences of exciting alarms, we have only to look at what they have already done and are preparing to do. Manumission is discouraged, and measures are about to be adopted to expel all free persons of color from the slave-holding States. Instead of an increasing disposition to co-operate in any plan of emancipation, there is now exhibited a more fixed determination than heretofore to maintain the institution of slavery.

The great engine which the abolitionists profess to wield, and by the operations of which they hope to bring their object within their reach, is free discussion. By the potency of abolition arguments, the slaveholders are to be instructed in their duty; to be taught lessons of humanity, of moral obligation and civil liberty; and to be induced to strip the bonds from their slaves, and receive them into social and political fellowship. After all that has been done to accomplish this end, it may not be unprofitable to look at the results. If we believe the concurring testimony of the citizens of the slaveholding states, not one convert has been made among them: On the contrary, their passions are aroused; a deep sense of indignation at unprovoked wrongs and a mischievous intermeddling with their domestic concerns, excites and agitates the entire mass of the white population. The abolitionists, and all their works, are loudly and universally denounced as seditious, incendiary and wicked; and the bonds of amity and concord which unite us to the people of the south, are threatened with severance because we tolerate within our borders these disturbers of their peace and violators of their laws. Such, we are assured, is the progress which the arguments of the abolitionists have made in bringing the slaveholders to a concurrence in their views.

When we consider the matter and manner of these appeals, and the character of the people to whom they are made, we ought not to be surprised that they have been indignantly rejected. In all that regards the civilities of life, in high intellectual cultivation and endowments, in moral conduct and character, in comprehension of the principles of civil and political liberty, in ability to give these principles a practical application, in love of country and devotion to its best interests, the people of the south have furnished as many eminent examples as any other section of the Union. When an attempt from any quarter, or under any pretence, is made to disparage them, if we forebore to vindicate their character, we might seem to be unmindful of what is due to them for the distinguished part they have acted in all the trials and conflicts through which our country has

passed, from the earliest stages of the revolution down to the present time. In all the views I have been able to take of the labors of the abolitionists, I have not discovered that they have produced a single benefit; but every step in their movements, thus far, has been attended with evil consequences. I will not undertake to describe the calamities which, in all probability, would result from their further progress, not only to the people of the several States, but to the whole human race, so far as the cause of civil liberty is concerned, because I indulge the hope that they have already reached the last stage of their onward career. I willingly turn from this view of the subject, to direct your attention to what has been done, and what may be required, to prevent further evils from this cause.

The people of this state continue to cherish an unabated attachment to the federal compact. The many signal advantages they have derived from it, and the many they still look for, bind them to a course of fraternal conduct towards their sister states, and lay them under the highest and most sacred obligations to fulfil in good faith, and to the utmost extent of its requirements, all the duties it imposes on them, and to abstain from all practices incompatible with these duties, or contrary to the spirit of any of its provisions.

Acting upon these principles, our fellow citizens very generally feel it to be their solemn duty, whatever they may think of slavery in the abstract, or in its actual condition in any section of the union, to leave its treatment, as it was left in their case, entirely and forever to the people of the States in which it exists. These States are not only entitled to the exclusive control of the subject, but, as they are immediately affected by it, they, and they only, best understand the proper mode of treating it; and it requires but a small share of good feeling towards them, and of diffidence in ourselves, to satisfy us that the matter may be safely left in the wisdom and humanity of those to whom it exclusively belongs.

If this State could be brought to think that the advantages it derives from the federal constitution, are not a sufficient compensation for the restraints imposed by that instrument; if, for the sake of displaying a morbid and fanatical spirit of false philanthropy, even at the risk of encountering the danger and incurring the responsibility of an attempt to reform the institutions of other States, it should be willing to give up these advantages, honor and duty would require it, before entering on such an experiment, to call upon the other States to release it from the solemn engagements it contracted in becoming a member of the Union; but so long as the people of this State cling to the advantage which this compact secures to them; so long as they profess to regard it as the source of their highest earthly good, and the object of their most cherished aspirations, they will, I trust, ever regard it as due alike to duty, to consistency, & to honor, to fulfil in its spirit every injunction it imposes, and to respect and observe with the utmost fidelity, all the great principles on which it is founded.

Under the influence of the foregoing considerations, and others of a kindred nature, our constituents have expressed their enlightened and deliberate judgment upon the subject under consideration. With an earnestness and unanimity never before witnessed among us, they have, without distinction of sect or party, in their primary assemblies, and in various other ways, expressed their attachment to the constitution of the federal government; their determination to maintain its guarantees; their disapprobation of the whole system of operations set on foot by the abolitionists; their affection for their brethren of the South; and their fixed purpose to do all that in them lies, consistently with law and justice, to render these sentiments effectual. It is not to be believed that these manifestations of public sentiment have been or will be disregarded by those who have engaged in, or given countenance to the abolition proceedings.

I am fully persuaded that the powerful energies of public opinion, as it has been called forth throughout the whole State, have already produced most salutary effects, in disabusing many persons who had inconsiderately concurred in the visionary schemes of the abolitionists.

When the very small number that still adhere to this cause, see that the immense majority of the people of this State, including certainly a proportionate amount of intelligence and worth, and embracing men of all sects in religion, and of all parties in politics, are utterly and irreconcilably

opposed to them; and that their measures are regarded with the deepest repugnance by all who affectionately cherish the Union and harmony of the States; including among them philanthropists at least as enlightened and sincere as any of themselves; they will, it is confidently hoped, be induced to pause in their career, and to sacrifice on the altar of their common country, the opinions and motives which have hitherto prompted them to exertions regarded with so much abhorrence by so great a majority of their fellow citizens.

When, to the just influence which may reasonably be anticipated from the sentiments of the people, so unitedly and powerfully expressed, and rendered still more efficacious, as I think they might and should be, by the opinions and views of their assembled representatives, is added the overwhelming weight of the arguments addressed to the reason and consciences of those who yet adhere to the abolition cause, it would be imputing to them a deplorable degree of mental blindness and fanatical delusion, not to expect a general abandonment of their wild schemes. All but those who are confirmed in fanaticism or reckless of consequences, it is believed, will be constrained by the decided and constantly increasing force of public opinion, to give up their dangerous attempts to act on the institutions of other states. Those who may not be thus reclaimed or controlled, will be too few in number and in influence, I am persuaded, to excite apprehension.

Relying on the influence of a sound and enlightened public opinion to restrain and control the misconduct of the citizens of a free government, especially when directed, as it has been in this case, with unexampled energy and unanimity to the particular evils under consideration, and perceiving that his operations have been thus far salutary, I entertain the best hopes that this remedy, of itself, will not only remove these evils, or render them comparatively harmless. But if these reasonable expectations should, unhappily, be disappointed; if, in the face of numerous and striking exhibitions of public reprobation, elicited from our constituents by a just fear of the fatal issues in which the uncurbed efforts of the abolitionists may ultimately end, any considerable portion of these misguided men should persist in pushing them forward to disastrous consequences, then a question, new to our confederacy, will necessarily arise, and must be met. It must then be determined how far the several States can provide, within the proper exercise of their constitutional powers, and how far in fulfilment of the obligations resulting from their federal relations, they ought to provide, by their own laws, for the trial and punishment by their own judicatories, of residents within their limits, guilty of acts therein, which are calculated and intended to excite insurrection and rebellion in a sister State. Without the power to pass such laws, the States would not possess all the necessary means for preserving their external relations of peace among themselves, and would be without the ability to fulfil in all instances, the sacred obligations which they owe to each other as members of the Federal Union. Such a power is the acknowledged attribute of sovereignty, and the exercise of it is often necessary to prevent the embroiling of neighboring nations. The General Government is at this time exercising that power to suppress such acts of the citizens of the United States, done within its jurisdiction, in relation to the belligerent authorities of Mexico and Texas, as are inconsistent with the relations of peace and amity we sustain towards those States. Such a power, therefore, belonged to the sovereignty of each of the States, before the formation of the Union, and as far as regards their relations to each other, it was not delegated to the General Government. It still remains unimpaired, and the obligations to exercise it have acquired additional force from the nature and objects of the Federal Compact. I cannot doubt that the Legislature possesses the power to pass such penal laws as will have the effect of preventing the citizens of this State and residents within it, from availing themselves, with impunity, of the protection of its sovereignty and laws, while they are actually employed in exciting insurrection and sedition in a sister State, or engaged in treasonable enterprises, intended to be executed therein.

I have recently received from the Governor of the State of South Carolina, a copy of a report and resolutions, in relation to the proceedings of the abolitionists, adopted by the Legislature of that State; and I herewith transmit them to you, in compliance with the request therein contained.

I have also received from the Governor of Alabama, a requisition to deliver up to that State, a person residing in the state of New-York, charged with the crime of distributing and publishing in the state of Alabama, a seditious paper designing and intending to incite the slave population of that state to insurrection and rebellion. The accused was not an actual fugitive from justice, and it did not appear that he had any other participation in the alleged crime than what arose from acts done within this state. I was therefore, convinced that neither the constitution or laws of the United States, nor of this state, imposed on me the duty, or conferred the right, to surrender him, and I declined to do so. A difference of opinion between the chief executive officers of the two states, in relation to an official obligation, due to one from the other, is much to be regretted: and the friendly relations subsisting between them render it proper that I should communicate the fact to you, together with the views of the Governor of Alabama, in support of the claim he has made on behalf of that state. I herewith transmit the documents and correspondence relative to this case.

In discharging the various and responsible duties, devolved on you as legislative guardians of this state, I shall give you my cheerful co-operation, in the confident hope that your labors will subserve the best interests and advance the general welfare of our constituents.

Albany, January 6, 1836. W. L. MARCY.

## AMERICAN RAILROAD JOURNAL.

NEW YORK, JANUARY 2, 1836.

Subscribers to the Journal who desire to obtain missing numbers, will please let us know as early as possible, that we may supply such as we may be able, from the few saved from the fire. A statement of the missing numbers should accompany the subscription for the fifth volume in advance.

With this number, it will be perceived that the Railroad Journal completes its 4th volume.

The work was undertaken at a period when very little, comparatively, was known in this country, except to a few Engineers, in relation to Railroads. The project was deemed, by most persons, as entirely visionary, and the idea of a Journal devoted to Railroads, was ridiculed by many. It was, however, believed by its projector, that the period was at hand, when the people of this country would view the subject of Internal Improvement, and especially of Railroads, in a more favorable light than at that period—and therefore a work of the kind would, most certainly, be useful to the country, and probably afford, at least, a return of the necessary investment to get it into circulation. Under this impression, the work was commenced January 1st, 1832, and has been continued regularly, until the present period, four years, with the exception of the delay caused by the late con-

flagration; and (although the subscription list has never yet come up to a thousand,) fifteen hundred copies of it have been regularly published, that the work complete, might be within the reach of those who desired to have it.

The publication of an edition so much larger than the subscription list, caused the expenditures, for the first three years, materially to exceed its income; but it was believed that the investment was at least a safe, if not an immediately profitable one; and so it would certainly have proved, as can be shown by the sale of back volumes, during the last year, but for the unparalleled calamity, which so many, in common with the proprietor of this Journal, will long have cause to remember. By that calamity, however, it has proved almost a total loss, as nearly the whole edition remaining on hand, or 400 complete sets, were entirely destroyed by the fire, leaving probably, not to exceed forty complete sets of the work unsold, and those mainly, scattered about the country, in the hands of agents—which are to be collected, before complete sets can be supplied.

In consequence of the inadequacy of the price, to meet its expenses, it was, after due deliberation and consultation, deemed advisable to increase the price to \$5 per annum, and then to make the work equal to the price, in preference to reducing the size to 8 pages, as was at one time contemplated. In accordance with that decision, the Journal will hereafter be charged at FIVE DOLLARS per year, instead of three dollars, as heretofore.

Such, indeed, have been my losses by the fire, that it is now highly essential to the continuance of the Journal, that the subscription for the ensuing year at least, should be paid in advance—and that all arrearages should be promptly paid.

The present number is to be considered a specimen of the work as it is to appear during the ensuing year, and as such it is sent to those who are, and to some few who are not, now subscribers to it, with the request that each gentleman who receives it, and who is willing to aid me in regaining, by my own exertions, what I have lost by the conflagration, will do something to extend its circulation.

The work must and will be continued, and as I have relinquished the publication of the New-York AMERICAN, with which I was connected over ten years, with a view of devoting myself exclusively to my periodicals, I shall be able to render them, and especially this Journal, more worthy of patronage, therefore every friend of Internal Improvement is requested to aid in its circulation, and support. D. K. MINOR.

New-York, January, 1836.

Editors of newspapers, who will call attention to the Journal, or publish the prospectus on the last page, and if they please, send their paper, may rely upon receiving the Journal hereafter in exchange.

SYRACUSE, COURTLAND, AND BINGHAMTON RAILROAD.—We find in the "Onondaga Chief," of the 6th inst., published at Syracuse, and publish, omitting the names, an account of the proceedings of the Convention held at COURTLAND VILLAGE, on the 24th of December, in relation to the contemplated Railroad from the Erie Canal at Syracuse, to the New-York and Erie Railroad at Binghamton. This Convention was, as might have been anticipated, and as we know from the list of names published, attended by a large number of the most respectable inhabitants of the counties of Onondaga, Cortland, and Broome—together with many others equally respectable from other counties adjoining.

This route is not only one of the most

feasible, but also one of the most important lateral Railroads in the State. It will not only pass through one of the most fertile, but also one of the levellest (save in one place) routes in the State. It is also the natural route for the exchange between New-York and Pennsylvania, of salt and gypsum on the one part, and coal on the other. It is also the most direct, and will eventually become the common, route between a large portion of the interior and the Commercial Emporium of the State; and it is only surprising to us that the intelligent, and enterprising inhabitants, of the country through which it will pass, have so long slept upon so important an enterprise. It only shows the want of correct information, in relation to the importance, and superiority, over other modes of travel and transportation, of RAILROADS. There can be no doubt in the minds of those who are familiar with their advantages, that they are destined to produce as great, and even greater, changes in the mode of doing business on land, as the application of steam to navigation has on the water. Indeed, the time is not distant when all the great thoroughfares of this country will be traversed by Railroads; and it will be as common for a man of business to travel *two hundred and fifty or three hundred miles a day*, as it now is for him to be *two, or three days* in travelling *one hundred miles*—through the mud. It will not then be thought more of, by the people of the interior, to visit the city of *New-York, Buffalo, Oswego, and Dunkirk, or Portland*, than it now is to visit the seat of justice, in the county where they reside; and what is of still greater, if possible, advantage to them, the improved facilities for business will in an equal ratio increase the value of property through the country.

In order, however, to realize these important advantages at the earliest possible period, information must be disseminated widely among the people. They must be made to feel and to realize the truth in relation to Railroads. They must be convinced, as they will be ere long, that, instead of being impassable in winter, they are more easily cleared, and kept clear, of snow than common roads. It must be recollected that they possess the most powerful apparatus for clearing the track, as has been abundantly proved by late experiments on the *Camden and Amboy Railroad*, according to the following extract from the "Courier and Enquirer" of the 13th, which says: "We were in error yesterday, in stating that the passengers by the Railroad line left Philadelphia on Sunday, at 12 o'clock, and did not arrive here until Monday evening at 8. It appears that they left Camden, opposite Philadelphia, at 2 o'clock on Monday, and were landed six hours afterwards in this city. We hasten to make the correction, with the remark, that nothing but the most indefatigable exertions on the

part of the proprietors, agents, and officers of this line, could have succeeded in clearing the track of such an immense body of snow, and keeping up an uninterrupted daily communication from city to city, as it has done, without the loss of a single trip, from the opening of the Road in 1832, to this day." It is indeed as much more powerful for that purpose, as it is for rapid travelling when the Road is clear. No one will pretend to deny that there has been, and probably will be again, days and storms so severe as to prevent travelling on Railroads, even as there are in the course of almost every winter, which prevent travel on any road; yet such days are few, and cannot be used as an argument against Railroads, any more than against common roads. It may therefore be assumed that prejudice will give, has already indeed given, way to a more correct state of feeling—and the day is near at hand, when the inhabitants on the route of this Road will be surprised that they have so long omitted, or delayed, a work of so much importance and convenience to them; and that they have so long waded, almost *wallowed*, through the mud of the "Indian woods."

This will be one of the most important among numerous other lateral Roads, which will connect the New-York and Erie Railroad with the Canal and the Lakes—this Road will undoubtedly be extended north from Syracuse into Jefferson and St. Lawrence counties, thereby making Syracuse the most central place in the State.

From Syracuse for about eighteen miles there is a gradual ascent of 10 to 20 feet per mile, to Tully. In this town there is an ascent, within the distance of 1½th mile, of about six hundred feet—which passes the ridge dividing the waters which flow into Lake Ontario, and into the Susquehannah River.

At this point there must be an inclined plane, with *stationary power*; and that nothing apparently should be wanting to render the route one of the most eligible in the country, this stationary power is supplied by never-failing springs of sufficient magnitude, which furnish several valuable mill seats—one of which might be used instead of a stationary engine. When the summit is attained, there is a gentle descent of from ten to twenty feet per mile to Binghamton, through a country every way eligible for the construction of a Railroad.

With such advantages, and the certainty of an early completion of the great New-York and Erie Road, and a fair prospect of a ready communication with the coal region of Pennsylvania, the inhabitants residing on, and near the route, will beyond all question press this work forward, so as to have it completed at least as early as to meet the New-York and Erie Road when it shall be completed to Binghamton.

#### SYRACUSE, COURTLAND, AND BINGHAMTON RAILROAD CONVENTION.

At a Convention of delegates from the several counties on and adjacent to the route of the proposed "Syracuse, Cortland and Binghamton Railroad," convened pursuant to public notice, at the Court House in Cortland village, on the 24th of December, the Hon. WILLIAM BARTLIT, was called to the Chair, pro tem., and HORATIO BALLARD appointed Secretary. On motion of H. S. Randall, of Cortland, Resolved, That a Committee of three be appointed to receive the credentials and collect the names of the delegates in attendance. The chair named the following Committee:—

Henry S. Randall, of Cortland,  
Vincent Whitney, of Broome,  
V. W. Smith, of Onondaga.

The names of over 300 delegates were taken, which it was believed were not the one half of those in attendance. It was however impossible to get them all in time, and the Convention proceeded to business as follows:—

On motion of Mr. Stephens, of Cortland, Resolved, That a Committee of ten be appointed by the Chair to report the names of suitable officers to preside at the Convention.

Whereupon the following persons were named said Committee:—

George Park, } of Binghamton.  
Christopher Eldridge, }  
Elam Lynds, } of Syracuse.  
Harvey Baldwin, }  
Cading Jackson, } of Lisle,  
John H. Hooker, " Truxton,  
Jonathan L. Woods, " Cortland,  
Fredus Howard, " Preble,  
William Andrews, " Homer,  
Alva Jarvis, " S'th Cortland.

Mr. Park from the Committee reported the names of the following officers, which on motion of Mr. Smith, of Onondaga, were unanimously adopted:—

ELAM LYNDS, of Onondaga, President.  
John Miller, Cortland, }  
J. Southard, Tompkins, } Vice  
Horatio Collins, Tioga, } Presidents.  
Elihu Ely, Broome, }  
S. S. Forinan, Onondaga, }  
Daniel S. Dickinson, Broome, } Secreta-  
Harvey Baldwin, Onondaga, } ries.  
Horace White, Cortland, }

On motion of Mr. Waterman, of Broome, Resolved, That a Committee of three be appointed to draft resolutions expressive of the views of the Convention, in relation to the objects for which it is assembled.

The following gentlemen were named said Committee:

Thomas G. Waterman,  
Henry S. Randall,  
Jonathan L. Woods.

Mr. Waterman from the Committee reported the following resolutions:

Resolved, That we regard the present condition, and anticipated progress of the great system of Internal Improvement, by Canals and Railways in the State of New-York, not only as justifying on the part of our citizens feelings of honorable pride and exultation, but as leading in its results to

the unexampled wealth and prosperity of the State.

Resolved, That the Erie and Champlain Canals on the north, and the New-York and Erie Railroad now in progress through the southern counties, are to be regarded only as the main arteries of internal communication between the great Western Lakes and the Atlantic, and that they afford vastly increased inducements through all the intervening sections of the State, to both public and private enterprise, to supply the minor and connecting veins in the general system.

Resolved, That among the works now in progress, or in contemplation, to unite these great commercial arteries, the one now proposed, and submitted to our consideration, that of a Railway from Syracuse to intersect the New-York and Erie Railroad, at or near Binghamton, is of commanding importance, whether regarded in reference to the profits of investment, or its convenience and utility to citizens on its route.

Resolved, That the friends of the grand system of internal improvement which has distinguished New-York, have abundant cause for congratulation in the commencement of the New-York and Erie Railroad, the great thoroughfare which is emphatically destined to give life, wealth and prosperity, to a section hitherto secluded, and virtually bring the fertile regions of the south and west to the confines of the great commercial emporium.

Resolved, That the Corresponding Committee prepare a petition to our Legislature for the required act of incorporation; that the petition be signed by the officers of the Convention, and be presented to the Legislature at the opening of the Session.

Resolved, That the name of the corporation to be so applied for, shall be "*The Syracuse, Cortland and Binghamton Railroad Company*," that the petition ask for a grant having Syracuse and Binghamton in view as points of termination, and that, as intermediate places to be named in the bill, as fixed points on the route, shall be both the villages of Homer and Cortland.

On motion, Resolved, That the sense of the Convention be taken on each of the resolutions separately. The 1st and 2d resolutions passed unanimously. On the reading of the 3d, Mr. Montgomery, of Tompkins, moved to amend the resolution, by striking out the words "to intersect the New-York and Erie Railroad at or near Binghamton," and substitute the following: "to strike the Susquehanna River by the most feasible route."

The Chair decided the motion was out of order.

Mr. Montgomery said he most earnestly desired that the amendment might be submitted to the decision of the Convention. There was another route than the one named in the resolution, which might be found to answer the same general objects, which he believed more feasible, viz: one passing through the south part of Virgil, Dryden, &c., and ending at Owego.

Mr. Guinnip, of Tompkins, concurred in the views of his colleague, and hoped the

amendment might be submitted to the Convention.

Mr. Whitney, of Broome, reminded the gentlemen from Tompkins that the motion had been pronounced out of order: if they were unwilling to acquiesce in the decision, their course was a plain one; they must appeal from it to the Convention.

Mr. Montgomery appealed from the decision of the Chair.

Messrs. Waterman, Dickinson and Whitney, of Broome; Messrs. Stephens and Canfield, of Cortland; Mr. Baldwin, of Onondaga, opposed, and Messrs. Montgomery and Guinnip supported the appeal.

The Chair explained; that having assembled under a call addressed to the friends of a specific object, and delegated, therefore, to act only in reference to that object, it was obviously beyond the powers of the Convention to entertain extraneous and adverse propositions to the original one, as the "friends" of which they had assembled.

The question on the appeal was then put, and the Chair sustained without a count. The question recurring on the passage of the resolution (3d), it was put and carried unanimously.

The 4th, 5th and 6th resolutions were read and passed unanimously. On the reading of the 6th, Mr. J. Miller, of Cortland, moved to amend, by striking out the word "Homer," and conforming the phraseology of the resolution to the omission.

Mr. Miller said he was willing to have Syracuse, Cortland and Binghamton as fixed points on the route of the proposed Road, but he lived on another branch of the Tioughnioga, the valley of which presented many perhaps equal facilities for the construction of such a Road, with that of the west branch, on which Homer stands. There was nothing, he contended, in the amendment adverse to the objects of the Convention.

Mr. Ross, of Cortland, opposed the amendment, and it being put, was lost, without a count: The original resolution (6th) then passed unanimously.

Messrs. Southard and Collins desired to be excused from acting further as officers of the Convention, which, on motion of Mr. Stephens, of Cortland, was unanimously agreed to. The Hon. SAMUEL G. HATHAWAY, and the Hon. WILLIAM BERRY, of Cortland, were nominated and appointed unanimously, to supply the vacancies.

On motion of Mr. Whitney, of Broome, it was

Resolved, That the Legislature be petitioned to cause the route of the proposed Road to be surveyed at the expense of the State.

On motion of Mr. Smith, of Onondaga, it was

Resolved, as the sense of this Convention, that the Legislature of this State may safely adopt the principle of granting Railroad charters to incorporated Companies upon liberal terms, whenever the citizens of different sections manifest a disposition to unite their means and efforts for effecting public improvements of that character.

On motion of Mr. Waterman, of Broome, it was

Resolved, That a Committee of three be appointed, to be known, and to act as the "Syracuse, Cortland and Binghamton Railroad Central Corresponding Committee."

On motion of Mr. Baldwin, of Onondaga, it was

Resolved, That the draft of a bill to incorporate the "Syracuse, Cortland and Binghamton Railroad Company," be referred to the Central Corresponding Committee, and that they be instructed to fill up blanks, &c.

The Chair announced the names of the following gentlemen to compose the

*Central Corresponding Committee.*

WILLIAM BARTLIT, }  
ADIN WEBB, } *Cortland Village.*  
HENRY S. RANDALL, }

On motion of Mr. Stephens, of Cortland, it was

Resolved, That a Corresponding Committee of three be named by the Chair in each of the places on and adjacent to the route of the proposed Road, as he may deem proper.

The Chair announced the following as such Committees:

*Corresponding Committees.*

*Syracuse*—V. W. Smith, Harry Raynor, James Manning.

*Onondaga Hollow*—Thaddeus Patchin, T. M. Dorwin, Samuel S. Forman.

*Jamesville*—I. W. Brewster, G. H. Richardson, G. W. Holbrook.

*La Fayette*—Ebenezer Colman, John Spencer.

*Tully*—H. F. King, Nichol Howell, Eli Earnham.

*Preble*—Fredus Howard, P. H. Burdick, Joseph Crofoot.

*Homer*—Horace White, E. C. Reed, A. Dounelly.

*Cortland*—C. Marsh, E. W. Edgecomb, Henry Stephens.

*Truxton*—D. Matthews, N. V. Allen, A. W. Otis.

*Solon*—S. G. Hathaway, D. Copeland, R. Rice.

*Virgil*—Wm. Woodward, R. Edwards, S. Roe.

*Freetown Corners*—C. Richardson, W. Birdsall, J. M. Roe.

*Marathon*—G. E. Peck, A. Carley, E. Perkins.

*List*—P. B. Brooks, J. Stoddard, jr., C. Salisbury.

*Whitney's Point, (Triangle)*—Thomas Whitney, G. Collins, J. D. Smith.

*Binghamton*—Tracy Robinson, J. S. Bosworth, Julius Paige.

On motion of Mr. Andrus, of Cortland, it was

Resolved, That the proceedings be signed by the officers of the Convention, and that the several newspapers on the route of the proposed Road, the Albany Argus, Evening Journal, N. Y. Times, American, and Courier & Enquirer, be requested to publish them.

On motion of Mr. H. S. Randall, of Cortland, it was

Resolved, That the thanks of the Convention be presented to its officers, for the able and dignified manner in which they have presided over its deliberations.

On motion of Mr. J. S. Bosworth, of Broome, the Convention then adjourned sine die.

OFFICE OF N. Y. & ERIE RAILROAD CO. }  
New York 14th Dec. 1835. }

To His Excellency WILLIAM L. MARCY,  
Governor of the State of New York:—

I have the honor, in behalf of the Directors of the New York and Erie Railroad Company, to transmit herewith, for the consideration of the Executive authority of this State, sundry documents, showing the situation of the enterprise in which they are engaged.

The interest which the progress of this work has excited in very extensive and important districts of the Commonwealth—the manifestations of public opinion, as exhibited by the proceedings of the Common Council of this city, and by the Convention of the southern and middle counties at Oswego, and the extent of the enterprise, embracing the whole territorial length of the State—(coupled with the right reserved by law, to take the work for public use at a comparatively early period after its successful operation shall have proved its value)—seem all to concur in rendering it proper, that the Chief Magistrate should be kept apprised of the progress of an enterprise, affecting so permanently and deeply the general welfare.

The particular details in respect to the prosecution of the work, will be found in the First Annual Report made by the Directors to the Stockholders, a copy of which is herewith furnished. To the facts therein stated, the accuracy of which has been verified, in nearly every instance, by the personal examination of the Directors,—the attention of the Executive is respectfully requested. The Board deem it necessary, also to state, that the fifteen members of this body who reside in the city of New York, have no private or personal interests whatever, involved in the prosecution of this work, except so far as they may partake in the public prosperity of this city, and in the expectation that the ultimate success of the enterprise may return to them, in common with all the Stockholders, a revenue affording a fair and reasonable equivalent for the risk which they may encounter, in embarking their funds in the undertaking.

A copy of a Resolution passed by their Board, pledging its members to abstain wholly from any pecuniary speculations in any of the counties traversed by the route, is herewith furnished.

A review of the documents, it is believed, will show, that the Directors have labored assiduously to ascertain whether this work is feasible—whether it will be useful—and at what expense it can be executed. The two first questions, as to its feasibility and usefulness, necessarily must be governed almost exclusively by the judgment of scientific and experienced Engineers. Although the members of this Board have satisfied themselves, by actual inspection of the route of the road, that the work presents no unusual or formidable difficulties, and that, with a single exception, its construction is singularly favored by the surface of the country, they have nevertheless deemed it their duty, to obtain evidence, from the most competent professional authority, of the ultimate utility of the work, before entering upon its construction. They have therefore submitted, during the present season, the whole plan of the road to the judgment of a Board of Engineers of the highest rank, and they are much gratified to be able now to lay before the Executive, the original Report of those gentlemen—establishing decisively the value of the road, and proving that it will afford the means of constant and rapid transmission of persons and property, at rates of speed, and in quantities, much exceeding previous expectations.

As to the expense of the work, the Board would remark, that the valuable experience acquired within this country during the last few years, has enabled Railroad Engineers to calculate at this

time, with very considerable precision, the cost of execution. Several instances might be adduced, if necessary, of public works in the neighboring States, (executed, too, under the direction of the distinguished Engineers who have been called upon for consultation upon the plan of this work,) which have been constructed within the sums originally estimated. The Board have never had any reason to doubt the accuracy of the survey, or the safety of the estimates, in respect to the New York and Erie Railroad, submitted at the last Legislature; and, nevertheless, when they regarded the unexampled extent of the work, they could not but await, with some anxiety, the result of their first attempt to obtain contracts for its actual execution. They have, therefore, felt it their duty, to use every means in their power, to detect any errors which might exist in the previous estimates, and for the purpose of subjecting them to a severe test, a section, unusually rugged in character, and sequestered in position, presenting far more than the average rate of expense, was selected as the portion first to be estimated. The result of that experiment is exhibited in the Report of the Executive Committee, presented to the Board during the last month, shewing that the graduation of 40 1-2 miles of the road, estimated by Judge Wright at \$366,286, has been actually taken by responsible contractors for \$313,551, being \$52,735 or 14 per cent less than the estimate.

The Board, therefore, have no hesitation in reporting to the Executive, that no reasonable doubt exists as to the ability of the Company to complete the whole of the road, from the tide water to the Lake, with all requisite vehicles, for the amount stated in their Report—and that the sum will not exceed, but will probably fall considerably short of, six millions of dollars. The sum of \$2,362,100 has been already subscribed to the stock of the Company, and will enable them to complete an extensive and profitable division of the work,—but they will be compelled, for the reasons set forth in their Report, to delay the completion of the residue, until the successful accomplishment of a portion shall demonstrate the value of the whole. It is obvious, however, that by the more tardy accomplishment of the work, the great public benefits to be afforded by its completion, from the tide water to Lake Erie, must be injuriously postponed, and that it therefore becomes the duty of the Board, to spare no effort to obtain additional funds with the least practicable delay.—They, therefore, deem it proper to communicate to the Executive authority of the State, their intention to apply to the next Legislature, for the requisite aid to enable them to hasten the completion of the work. They propose, however, in view of the heavy advances to which the public Treasury will be subjected in order to improve the Erie Canal, to ask only for a loan of the public credit, to be advanced in instalments, not exceeding in the aggregate three millions of dollars, and only as fast as the Company, with their own means, shall have previously completed continuous sections of the work, sufficiently extensive and valuable, to afford to the State a perfect security against any possible loss or inconvenience.

That such a measure of policy is supported by precedent, is abundantly manifested in the frequent instances referred to in the accompanying documents, in which the neighboring States have loaned their public credit to companies engaged in works of internal improvement within their territory, designed for the very purpose of diverting from this State, and its commercial metropolis, the lucrative trade heretofore enjoyed with the Western States. The liberal and energetic course of legislation thus pursued by those enlightened communities, in fostering those rival works, would seem to render it more peculiarly proper and necessary, that similar measures of protection should be speedily afforded to the citizens of our own State, by those who direct the public councils.

The importance of the New York and Erie Railroad, in connecting the navigable waters of the Hudson with Lake Erie and the Alleghany River and thereby securing to the city of New York the trade of the West, is fully set forth in the accompanying documents. The Directors charged with the execution of a work so important to the general welfare, therefore venture to express the hope, that its auspicious commencement and hitherto successful progress, may be regarded as a matter of public interest, properly falling within the respect annually submitted by the Executive to the representatives of the people, that the avenue of trade

and intercourse which it proposes to establish through the State, and with the rapidly increasing communities on our western borders, will be looked upon as an improvement calculated to augment the power and elevate the character of the Commonwealth,—and that such efficient measures of assistance, as may be deemed necessary to secure a speedy completion, and not inconsistent with the public interests, may be recommended to the favorable consideration of the Legislature.

I have the honor to be, with great respect, sir,

Your obedient servant,

JAMES G. KING,

President N. Y. & Erie Railroad Co.

**CHAMPLAIN AND ST. LAWRENCE RAILROAD.**—We find in the Montreal Courier, of December 17th, the proceedings of the half yearly meeting, of the stockholders of the above named railroad, accompanied by the Report of the Committee of Management, and the Chief Engineer. From the Report of the Committee, we make an extract, and publish the Report of the Engineer, Mr. Casey, with the proceedings of the meeting entire, together with some appropriate remarks of the Editor of the Courier.

The remarks of the Engineer and of the Editor, in relation to the benefit which the people will derive, from the expenditure of so much money amongst them, are equally applicable to most other works of the kind.

The plan of doing the work by days, and not by contract, is not common on such works. It may be, however, and we are inclined to think it is, where the people of the vicinity upon whom reliance can be placed, will engage in the work, a matter of economy.

By this report it will be seen that the spirit of improvement is spreading northward as well as southward—who can tell where it will stop?

**CHAMPLAIN AND ST. LAWRENCE RAILROAD COMPANY.**

At the half-yearly meeting of the Stockholders in this Company, held this day pursuant to public notice, J. E. Mills, Esq., Deputy Chairman of the Committee, opened the meeting with a few preliminary observations, and submitted the Report of the Committee of Management, which was, together with the Report of the Engineer, then read by the Secretary; after which, John Boston, Esq., was unanimously called to the chair, and the Reports were approved of and adopted by the meeting.

The election of a Committee for the ensuing year then proceeded, and Messrs. T. Follet and Charles Lindsey officiating as scrutineers, after examining the ballots, declared the following gentlemen:—

Messrs. Hon. P. McGill, J. C. Pierce, R. Jones, L. B. Ward, J. E. Mills, Jos. Shuter, B. Holmes, T. Bouthiller, and James Logan, re-elected by a large majority of votes.

The Chairman here took occasion, on behalf of the meeting, to convey to these gentlemen the high sense felt by the Stockholders of the value of their services, gratuitously rendered—a stronger expression of which could not be given than in the result of the ballot just declared.

**EXTRACT FROM THE REPORT.**

We, the Committee of Management of the Champlain and St. Lawrence Railroad

Company, in calling the attention of the Stockholders generally to this our Report of the operations for the past season, deem it expedient to revert to the peculiar circumstances attending the commencement of this undertaking—the very unfavorable season for such operations—the short space of time we have been occupied—and the freedom from litigation in all our engagements; which, taken together, when we reflect on the amount of work done, affords to all interested, ample grounds for congratulation, and will tend to show that, when unshackled by restraints or legal impediments so far from proving behind our neighbors in enterprise, we have, for promptitude and despatch, in this our *coup d'essai*, gone beyond any thing of a similar nature, even in the United States. Thus removing from among us that reproach to which we have hitherto so long, and of necessity, been obliged to submit.

When, in February 1832, when the Act was passed permitting the Petitioners to build a Railroad, it was apparently so cramped by restrictions, as, for a while, to become a dead letter, nor was it till November 1834, when Mr. Pierce, of St. John's, by his unwearied exertions, obtained a sufficient number of subscribers to preserve the Charter from falling through, that the provisions of the Act became fully understood. It is, therefore, to that gentleman and the Hon. R. Jones, that the country and community are chiefly indebted for the advantages already received, and likely to accrue.

We could not offer a more striking illustration of the change of public opinion regarding the value of the Railroad stock, as an investment, than by the facts, that, in December, 1834, after the number of subscribers required to preserve the Charter obtained, the balance of stock with difficulty found purchasers; whereas, in December, 1835, the stock is in great demand, and transfers have been made at 51. per share premium; and we flatter ourselves that the activity and determination evinced in our operations may have, in some slight degree, contributed to this desirable state of things.

In the United States, to which, from its proximity, we naturally refer, we believe it to be the custom to spend considerable time in surveying, planning, preparing material, making specifications, and giving out contracts. We, on the contrary, have "taken time by the forelock"—done the work by day-labor, and have the pleasure of adding are so far advanced, that there is ample prospect of its ultimate completion in the course of July next.

To the Chairman and Committee of Directors of the Champlain and St. Lawrence Railroad, I submit the following Report on the progress made in the undertaking, of which I have the honor of being the Engineer:—

The time between my appointment and the commencement of field operations, was occupied in giving the information and specifications necessary to enable the Committee to contract, without loss of time, for the timber, iron, and materials for fencing. This being accomplished, the quantity of land required from each farmer was ascertained and purchased by the Commissioner. The quantity taken was merely enough for the road, as that officer caused to be inserted in the deeds a proviso, that the Company may at any time, take the full quantity of land allowed by the Act, on the same terms, thus reserving the outlay of a considerable sum till absolutely required, and preventing the possibility of the Company's being put to any unnecessary trouble or expense in

enlarging the work at any future period. The importance of this arrangement will be more evident hereafter.

In undertakings of this kind it is usual to spend some time before commencing operations, in staking out the line, and preparing plans and specifications of every part of the work in detail. The contracts are then given out in the fall, and, during the winter, the necessary materials are drawn on the spot where they will be required, and every arrangement made to do that, the nature and extent of which has been accurately ascertained. But here, in the autumn of 1834, only five days were spent on the ground without time to bestow a single thought on any thing except the general location within the limits prescribed by the Act, consequently the season in which the grading was to be completed, opened upon us without the possibility of our having those definite plans and previous arrangements determined on, which contribute so much to the economy and success of all public works.

Owing to the inclemency of the weather, the staking out was not commenced till May and early in June ground was broken on the summit level near St. John's, on the only piece fenced in. The tardiness with which the materials for fencing were delivered, and the impossibility of entering on the farms till completely enclosed, compelled us to abandon the St. John's end of the line, for upwards of a month, a loss of time which the subsequent heavy and nearly incessant rains, rendered it impossible for us to recover.

Ten miles of the grading, forming about one-eighth of the entire expense, was done to advantage in the wet weather, but the remaining seven-eighths were principally occasioned by carting, a large proportion of the earth having been carried from one-quarter to one half, and even three-quarters of a mile over the worst kind of clay, in one of the worst seasons ever experienced, and, but for about four weeks good weather in the months of September and October, I should not now have the satisfaction of announcing the completion of the fencing, graduation, masonry, bridges, the large wharf at Laprairie and the frames of the station-houses. With the exception of the woodwork of the wharf, all has been done by the day. This, though contrary to established custom, was rendered unavoidable from the want of time to make the necessary preparations for putting the work under contract, and still more so from the fact, that no forfeit on the part of a contractor could have indemnified the company for the non-fulfilment of his contract, as it was of the last importance that the graduation should be completed this season; and, had not this plan been adopted, there can scarcely be a doubt that this indispensable object would not have been attained. The men were engaged, and all the materials and tools purchased by the Commissioner. The men were paid every Monday evening, and a degree of order and harmony prevailed throughout all departments seldom witnessed on public works, for which the Company are indebted to the unwearied assiduity and admirable management of the Commissioner, and the assistant Engineer, Mr. Livingston.

The bridges are built in the strongest manner, and may be crossed at high velocities without injury. The principal bridge is over the Little River, four hundred feet long and thirty feet above the water. The channel is crossed by a lattice bridge of sixty-seven feet span, the roadway passing on

the top. There are four other bridges, varying from one hundred and seventy to twenty feet in length.

The wharf at Laprairie is eleven hundred feet long, thirty-two feet wide, and one foot higher than the old wharf. It is built in the most substantial manner, and has elicited the praise of the hundreds who visited it during its construction, and is certainly not excelled by any similar work in the Province.

The frames of the station houses are raised, but they are not yet covered in.—The dimensions are one hundred by 40 feet. They are substantially built, and are intended to be finished without any unnecessary expense. Another will be required in a year or two at the Little River. Ground has been prepared for two turn-outs, one at the Battaille, the other at the Little River; and more may be added, as experience shows, where they will be most convenient.

The iron, and the various descriptions of timber for the road are delivered. The dressing of the latter has been placed under contract, and a considerable portion is already done. The drawing of the timber along the line has also been placed under contract on very advantageous terms.

Arrangements have also been made to procure a locomotive from England in the spring, four passengers' cars from the States, and the various castings for the road and the iron-work for the freight cars in this city; so that, with the different parts of the superstructure distributed along the line, and all requisite previous arrangements made, the Committee may confidently expect to open the road in July next, the exact time depending more on the season than on all other considerations united, as the settling of the ground varies at least three weeks in different years.

I now proceed to give a detailed account of the cost of the various parts hitherto executed, and an estimate of the amount required to complete the whole; remarking, that low as is the average cost of the graduation per mile, it has yet been much increased by the following circumstances:—Seventeen thousand cubic yards of slat-rock were encountered on the common of Laprairie: the carting, the grand item of expense, has been increased fifty per cent, by the rain, but little earth has been moved without the aid of the pickaxe; besides which, a large portion of the work was, from these various causes, crowded into the short days, in itself a very serious additional expense.

AMOUNT EXPENDED.

	£	s.	d.
Graduation, Masonry and Bridges,	8,514	19	9

2,790 0 0

£34,800 0 0

Being at the rate of 569¢ for Graduation, Masonry, and Bridges per mile, and 2,385 per mile for the Road complete, with Engine and Cars, Station Houses and Wharves.

I have now given at length the account of our summer's work, the amount expended, and the amount yet required; and feel confident that, taking into consideration the impossibility of making the usual preparations, the absence of experienced workmen, the nature of the ground, and the novel mode of conducting the undertaking, the Committee and Stockholders generally will be satisfied that the most has been made of six months, in locating the line, in completing the fencing, graduation, bridges, masonry and wharf, besides making all the necessary arrangements for opening the road in the least possible time next year.

For my own part, in reviewing our operations, I do not see where any saving worthy of notice could have been effected.

In conclusion, I beg leave to mention a circumstance which can scarcely be a matter of indifference to the Committee—that this, the first public work undertaken by a private Company in this Province, has, from the manner in which it has been conducted, already proved a public benefit, by giving employment and regular pay to hundreds of laborers, who, at parting, warmly expressed their satisfaction at the manner in which they had been treated, mingled with regrets that their services were no longer required. The Canadians formed by far the greater portion of the laborers, and maintained their character for behaving with a degree of order and good nature, when working together in large numbers, unequalled by any other people. Many of them had become much reduced by the misfortunes of the last three years, and to such the railroad has proved a signal benefit—furnishing the poorest with the means of softening the hardships of winter, enabling others to clear their farms from ruinous encumbrances, and banishing want from the doors of all whose land it has touched.

Respectfully submitted.

WILLIAM R. CASEY,

Engineer Champlain & St. Lawrence Railroad.

To the Hon. P. McGill,  
Chairman of the Committee.

The Reports of the Committee and Engineer of the Champlain and St. Lawrence Railroad Company, in another column, will, we are sure, be read with interest, as the undertaking to which they refer is the first of the kind projected in this Province. We see in its favorable prosecution, so far, the earnest of a success, that will embolden other companies to enter upon similar means to improve our internal communication. We feel convinced that this railroad, when fairly in operation, will put to flight a host of prejudices—will expand the mind of the public, and give a stimulus to the enterprise of all classes.

The undertaking will doubtless prove of incalculable advantage to the community, and we are happy to say, that from the eagerness with which the railroad Stock is sought after, it is shrewdly expected that it

will be a profitable investment for capital. It is calculated that when this and the road between Whitehall and Saratoga are completed, that the journey from Montreal to New-York, may be accomplished in thirty-six hours, which will effect a material saving of time. For fuller details of the progress of the work, and of the future arrangements, we must refer to the reports themselves.—[Montreal Courier.]

We beg to call attention particularly to the concluding paragraph of Mr. CASEY'S Report, which refers to the advantage which the country people have already derived from the railroad. They were, we understand, when dismissed, very anxious to know if any other work of the kind was likely to be undertaken in that quarter next summer, as they would gladly accept of another season's employment.

#### [From the Vermont Chronicle]

CONNECTICUT RIVER AND ST. LAWRENCE RAILROAD.—At a meeting of citizens of Windsor, 10th Dec. inst. it was resolved, in accordance with suggestions, from the North and the South, to call a general Convention, to take measures to construct the contemplated Railroad through the valley of the Connecticut to the St. Lawrence, connecting with New Haven and New York. The place designated was Windsor, Vt., and the time Jan. 20th, 1836.

Among the reasons for this movement are the following:

1. The Legislature of Vermont, at its late session, granted an act of incorporation for a Railroad, from the south line of the State, in Windham County, to the North line, in Orleans County.
2. It is understood that petitions are about to be presented to the Parliament of Lower Canada for the charter of Railroads from Lake Memphremagog in two directions, viz. to Montreal and Quebec, prospectively to connect with the Connecticut River Railroad. It is also understood that a lively interest is felt in Canada, in this enterprise, and that a convention of delegates from the towns on the respective routes in Canada, and in the valley of the Passumpsic, in Vermont, is appointed to be held at Derby Line on the 31st inst.
3. It is understood that a fresh interest is awakened among the friends of the enterprise on the southern part of the route.
4. The time has unquestionably arrived when a convention of citizens, from the towns on the whole route, can no longer be delayed, without manifest detriment to great and important interests.

The object of the measures to be taken at the Convention are these:

1. To obtain charters for those parts of the route not yet granted.
2. To procure a survey of the whole route, with estimates of the expense.
3. To collect and arrange facts concerning the amount of business that may be expected on the route.
4. By those and other means, to present to the public such a report as shall induce capitalists to make investments in the stock.

The great importance of this enterprise is obvious on a moment's reflection.

The agricultural susceptibilities of this whole country are very great—second to none in New England.

The water privileges and powers of manufacture are immense.

As a thoroughfare of business and pleasure, the route is unrivalled.

It will connect the great cities of New York and Canada, and bring them within twenty-four hours ride of each other.

The country is singularly adapted to the construction of a Railroad—no point, it is believed, will require a stationary engine.

The greatest activity prevails among the friends of other kindred enterprises in New England. The people on this route do not now put forth their best efforts in the accomplishment of this object, they will tamely give into the hands of others the advantages which nature has put into their own.

These considerations, it is confidently believed, will insure, at this Convention, a general attendance of delegates from all the towns on the route; and gentlemen into whose hands this Circular may fall, are earnestly requested to use their influence to cause the appointment of the same.

Gentlemen who may attend, are requested to bring with them as much statistical and other information, on the objects above specified, as possible.

THOMAS EMERSON,  
ALLEN WARNER,  
CARLOS COOLIDGE,  
JOHN RICHARDS,  
I. W. HUBBARD. } Committee.

Windsor, Vt., Dec. 21, 1835.

WABASH AND ILLINOIS RAILROAD.—A respectable meeting of the citizens of Pekin, Illinois, took place in that town on the 21st of November, for the purpose of taking into consideration the expediency of uniting with their fellow citizens of McLean, Champaign and Vermillion counties upon the necessary measures for the construction of a railroad from Pekin on the Illinois river to the point on the Wabash, where the projected Indiana canal is to terminate. Nathaniel Baley and Wm. H. Sandusky, Esquires, acted as President and Secretary of the meeting. The following preamble, adopted unanimously will shew the object of the meeting:

Whereas the cities on the Atlantic seaboard by the continually increasing emigration to the State of Illinois, are becoming of paramount consideration to all classes; and as the present existing facilities of communication between those cities and this State are very limited, and at certain seasons of the year of a very dangerous character—and as the people of Indiana have manifested their conviction of the importance of a more direct and safe communication with those cities by uniting the Wabash river with Lake Erie. And as the people of Illinois generally, as well as citizens of Vermillion, Champaign, McLean, and Tazewell counties are deeply interested in the construction of a Railroad from the Illinois river to the Wabash.

A committee consisting of five members was then appointed to confer with the citizens of the counties interested in the work, on the measures best calculated to carry it into effect, and five delegates were appointed to proceed to Vandalia for the purpose of co-operating with other delegations from these counties in relation to the subject matter.

The Secretary of the meeting who forwards us the proceedings—which it is quite out of our power to publish in *extenso*, asks us to request the papers of New York, Philadelphia, Boston and Providence, to copy them.—[Courier and Enquirer.]

#### From the Argus.

WESTERN RAILROAD.—(FROM WORCESTER, VIA SPRINGFIELD, TO WEST STOCKBRIDGE.)—At an adjourned meeting of the stockholders of this company, at Boston, the following gentlemen were chosen directors:

GEORGE BLISS, } Springfield,  
JUSTICE WILLARD, }  
T. B. WALES.  
EDMUND DWIGHT,  
HENRY RICE,  
FRANCIS JACKSON,  
WILLIAM LAWRENCE,  
JOSIAH QINCY, jr.  
JOHN HENSHAW.

The meeting of the stockholders is said to have been numerously attended, from the towns on the route, and from the city of Albany. It was announced, and statements

were read showing the fact, that the entire stock has been subscribed, with a sufficient excess to meet contingencies. This important work, which when constructed, will complete the direct railroad communication between this city and the city of Boston, will be commenced, we understand, at the earliest day practicable.

**LOCOMOTIVE ENGINES.**—We make the following extract from a letter dated Dec. 1, from a friend in Charleston, S. C., in order to show that improvements in Railroad Machinery is not confined to Baltimore, or any other one place, but wherever there is a Railroad, there also may be found improvements. It may well be asked, Who dared, ten, or even five, years ago, to predict that an Engine would be constructed, and especially in this country, capable of taking a load of 130 tons eighty miles in a day, and that too up inclinations of 37 feet per mile?

In relation to the comparison made with the Baltimore Engines, the statement is to indefinite to form an opinion—

Charleston, S. C. Dec. 4, 1835.

To the Editor of the Railroad Journal:

Sir—I take the liberty of giving you an account of the performance of the improved Six Wheeled Locomotive Engines, now at work on the Charleston and Hamburg Railroad, built after the plans and drawings of E. K. Dod, Chief Engineer of said Road.—These Engines perform a trip from Charleston to Aiken and back in three days, the distance is 240 miles, carrying a train equal in weight to 130 tons—with this load they surmount all the ascents, some of which are on a grade of 37 feet to a mile. You will perceive that this is more than double what the Engines on the Baltimore and Ohio Railroad are doing according to the accounts in your Journal. These same Engines are capable of travelling with our ordinary passenger train at a speed of 40 miles per hour, although the Engines are limited to run but 20 miles per hour, unless they are behind the regular time. The cylinders are 10½ inches in diameter and 16 in stroke, driving wheels 54 in. diameter, the cylinders being secured on the outside of the boiler, unable us to dispense with the Cranked Axle.

[We shall be gratified to hear farther particulars from the writer of the above letter, in relation to the Charleston Railroad and its machinery.—[ED. R. R. J.]

From the London Mechanics' Magazine.

PRINCIPLES OF RAILWAY LOCOMOTION.

Sir,—The writers on dynamics have demonstrated, that the force just necessary to prevent a heavy body from rolling down a smooth inclined plane (abstracting friction)

is  $\frac{ah}{L}$ , where  $a$  is the weight of the body,  $h$  the height of the plane, and  $L$  its length. This theorem is universally true, whether as respects our earth or any other of the celestial bodies. But in determining the space, time, velocity, &c., in and with which a body moves down an inclined plane, or when projected up a plane, it has hitherto been found absolutely necessary first to ascertain experimentally the value of the symbol  $g$ , which means the measure of the force of gravity or the velocity a body has acquired at the end of the first second, the motions commencing from a state of

rest, and the direction being in a vertical line; and from thousands of experiments, the value of  $g$  in our latitude has been found to be 32½ feet. I observe, however, in No. 618, your scientific correspondent, Mr. Herapath, has attempted, without the aid of  $g$ , to give us some very important formulæ on the principles of Railway Locomotion; I say important, if they shall turn out to be true; but on this point I must confess that I have some misgivings.

Mr. Herapath says, "that he has determined three rules as simple and correct as he believes it is possible, in the present state of our knowledge, to make them." Then follow the three formulæ (see p. 182, col. 2, and 193, col. 1). Mr. H. himself, however, seems a little puzzled at the result

of the expression  $1 \pm \frac{h}{22}$ , which repre-

sents the speed in miles per hour when the load is moving up or down the plane. For, as he truly observes, "we can hardly apply this formulæ to descents unless they be very small; for if the descent was 22 feet per mile, it would make the velocity appear to be infinite," &c. No doubt the formula produces such a result; and it is rather surprising that when Mr. H. found this was the result, he did not take it as a warning that there might peradventure be something wrong in his formula. An infinite velocity is no joke, and, perhaps, might be attended with some danger. Let us assume  $h=21\frac{1}{2}$  feet (and on this supposition gravity will not do all the work); the velocity in this case will be 1,290 miles per hour (quick enough, no doubt, for any ordinary purpose). Again, by assuming  $h=22\frac{1}{2}$ , the velocity will turn out to be negative at the rate of 1,320 miles per hour. A negative speed, although perfectly understood by algebraists, may, to some of our readers, who do not rank as such, require some kind of explanation. For their benefit, here it is. The carriage and load, instead of moving down the plane, as might be expected (as gravity in this case does something more than the whole work), will, to the utter surprise of every one, roll up the plane at the rate of 1,320 miles per hour!

Perhaps, however, Mr. A. meant that when  $h$  is greater than 22, the formula as-

sumes the form  $\frac{h}{22} - 1$ . But upon trial,

this change will not much mend the matter. I am afraid the formula will not be exactly true, except in the case when  $h=0$ . Mr. H., it is true, may say that the resistance of the air will prevent any thing like a velocity of 1,290 miles per hour. No doubt, if we had 30 square feet of opposing surface, and when the resistance of the air approaches "nearly to 344 horses' power," it would certainly be a very great check upon the velocity. Again, Mr. H. may state that he has premised that the value of  $h$  must be very small; I know he has said so, but in answer to this I beg to state, that he has not given the greatest limit to  $h$ , so that we may know when his formula presents a true or a false result. With respect to this formula, as it regards ascending planes, although it does not present such seeming absurdities, still, being derived from the same suspicious source, no faith can be placed in its accuracy.

I am well aware, Mr. Editor, that Mr. H. is considered by many to be both a mathematician and a philosopher of the first order; I well recollect the challenge he gave to the Royal Society on some phy-

sical questions, backed by a wager of 1000l.; still, notwithstanding all this, I maintain that his algebraical formulæ on Railway locomotion, are not founded upon true principles.

I am, sir, yours, &c.

IVER MACIVER.

June 30, 1835.

P. S.—I am much obliged to Kinclaven for the correction he has made in my last article; the only recompense I promise him will be, if he should ever fall into a like mistake, I shall endeavor to set him right.

I. M.

From the Journal of the Franklin Institute

MR. HERRON'S IMPROVEMENTS IN RAILROAD CARS.

(Extracted from the List of American Patents which issued in March, 1835.)

54. For improvements in Railroad Cars; James Herron, Civil Engineer, Richmond, Henrico county, Virginia, March 25.

There are several distinct improvements claimed by this patentee, all of which are described in a very full and clear manner, and illustrated by drawings, which leave nothing to desire on this point; it will appear, however, upon examining into the originality of the things claimed, that they are generally old, and have been fully described in this journal, or elsewhere in public works. The following are the claims.

"Specification 1st.—In this I claim as being the original inventor of carriages adapted to run alike on the edge railway, and on turnpike roads, as hereinbefore described.

"Specification 2nd.—In this I claim as being the original inventor of the roller flanches for retaining and guiding carriages on rail-roads, as hereinbefore described.

"Specification 3rd.—In this I claim as being the original inventor of the plans hereinbefore described for making the carriages conform to the curves on the railway.

"Specification 4th.—In this I claim as being the original inventor of the friction head, for reducing the friction of axles, as hereinbefore described.

"Specification 5th.—In this I claim as being the original inventor of the friction band, for reducing the friction of axles, as hereinbefore described.

"And I distinctly claim the right to apply my improvements, or inventions, herein specified and described, in whole or in part, as the nature of the case may require, to all carriages, cars, wagons, locomotive engines, and other machines."

The thing claimed in the first specification, which is for adapting the wheels to run on common roads, was the subject of a patent obtained by Samuel T. Jones, of Philadelphia, on the 22d of February, 1830; see vol. v., page 151; and also of one obtained by Mr. John pollock, on the first of October of the same year. The present patentee uses wheels of five feet in diameter, with a flat tread, and without the usual flanch, instead of which "there is placed alongside of each wheel a flat disk of iron, which I term a roller flanch, as it is at liberty to revolve on its own axis, entirely independent of the burthen wheel;" "when the carriages are used for streets, the roll-

er flanges are raised up to the position represented by the dotted circle." Mr. Jones, in his specification, above referred to, says, "I sometimes make my wheels without flanges, and, instead thereof, use friction rollers, fixed upon, or adapted to, suitable arms, or bearings, extending down to the rail, so that the rollers may bear against its side, and perform the office of a flanch." "I construct them so that they may slide up, when the car, or carriage, is about to pass off the railroad."

The plans claimed for making the carriages conform to the curvature of the railway are two, both of which require that the axles of the fore and the hind wheels should have their bearings on separate rectangular frames, which allow the axles to move from their parallel position, like those of common carriages, by means of the hounds; but in the case before us both frames turn, they being "connected by means of the coupling bar at a point intermediate between the axles, to which bars are attached toothed segments, adapting each pair of wheels equally to the curvature of the road."

By turning to vol. iii. p. 66, it will be seen that the late Dr. Wm. Howard obtained a patent, dated Nov. 22d, 1828, for the application of this principle, which he states in the following words: "The connexion of the two beds of the axles at a point equidistant from each; and in the same manner the connexion between the hind bed of one wagon, and the fore bed of that following it, or the fore bed of the leading wagon with any system of guide wheels, so that the wheels not only of one wagon, but of a train, will follow one another in the same curve, without more lateral friction than when on a straight line." This description is accompanied with plates, to which the reader may turn, and see a full exemplification of the principle.

Under this same head, Mr. Herron refers to a method of using jointed crossbars, instead of the circular segments, by which "the same object will be more simply effected." by turning to the patent of Mr. John Pollock, obtained October 1st, 1830, this coupling by jointed crossbars will be found represented in a drawing, together with several other things which the present patentee deems to be new, and among them the making the wheels without flanges, that they may run upon common roads; see vol. vii. p. 17.

The "friction bands," mentioned by the patentee as claimed under his fourth specification, are hoops, or rings, of iron, by means of which the carriage frames are suspended below the axles of the burthen wheels; the hoops pass over the prolonged ends of the axles, and under friction rollers upon the frame of the carriage, and are to roll around by the friction of the axle upon them, in the manner, though not for the purpose, of Winan's friction wheels. It will be found in practice that these hoops will frequently stand still, and allow the axle to turn within them, as has often been the case with Winan's wheels, which have in several instances been cut through by this means. Besides this, the idea of suspending the load upon revolving rings is

not new; N. Finlay, of Baltimore, suspended the load in this way; see the notice of his patent, dated October 27th, 1829; at p. 36, vol. v.

The cranked axle mentioned in the fifth specification is intended to allow the load to extend below the axis of the load wheel. This has been effected by Samuel T. Jones, in a car patented by him, and described, vol. v., page 149; it has also been effected by others. We could have cited other authorities, also in most of the cases above noticed, with some of which we opine that it would be well for civil engineers to make themselves acquainted.

#### BACHMANN'S FRAME FOR RAILROAD CARS, AND OTHER CARRIAGES.

(From the List of American Patents which issued in May, 1835.)

4. For an improved *Frame for Railroad Cars, and other Carriages*; Heinrich Bachmann, Lancaster, Pennsylvania; an alien who has resided two years in the United States: May 2.

We are informed that by the plan here proposed, Railroad Cars may turn the small curves necessary in leaving the track for a warehouse, a yard, &c.; and that the lateral friction on the rails will be no greater upon any curve than on a straight line. We wish that this was true, but, unfortunately, the theory of the patentee is incorrect, and the plan by which he proposes to produce this useful effect is without novelty, its essential principle being well known, and repeatedly patented. The plan for causing the fore and hind wheels to adapt themselves to a curve, simultaneously, is the same with that upon which we remarked at p. 249, when speaking of Mr. Herron's patent, and to which, in order to avoid needless repetition, we must refer the reader. As regards the correctness of the theory, let it be remembered that when the fore wheels of a car pass from a straight road on to a curve, the hind wheels are still upon the former, and that by the plan proposed they are adapted to a curve at which they have not yet arrived, and will, therefore, have to grind their way to it. The patentee proposes to place the hind and fore wheels ten feet apart, which will greatly augment the evil that he imagines he has removed.

As in turning curves the opposite wheels must move with different velocities, the patentee uses a separate axle to each wheel, thus admitting of this difference of motion; there is no more novelty in this than in the other parts of the plan. Separate axles have been repeatedly used; and the same effect was produced, many years since, by leaving one wheel on each axle loose, so that, when necessary, it could turn upon it in the ordinary way.

34. For *Increasing the adhesion of the hind wheels of Locomotive Engines*; Chas. and Geo. Escal Sellers, city of Philadelphia, May 22.

A patent was obtained by Mr. E. L. Miller, on the 19th June, 1834, for a method of obtaining a similar end, by throwing the weight of a car, or tender, on to the hind part of a locomotive engine.

The present patentees effect the object by "so coupling, or connecting the cars containing the load to be drawn, to the body of the locomotive engine, as that the load by its action upon a lever, or standard, shall tend to raise the fore end of the locomotive, in any desired degree, and thus to lessen the pressure upon the fore, and transfer the same to the hind wheels."

The patentees say that they "do not mean to limit themselves to any particular form or manner of constructing the parts concerned in producing the intended effect, but claim as their invention the connecting to a Locomotive Engine, the load which is to be drawn by it, in such a manner as to throw a larger portion of the weight of the locomotive upon its hind wheels than they are ordinarily intended to sustain, in the manner, or upon the principle herein before set forth."

It will be readily seen that the coupling bar, or jointed rod, by which the car is attached to a locomotive, if attached to it at a point considerably above that by which it is attached to the car, will tend to lift the latter, and to draw down the former, and thus to increase the adhesion of its hind wheels.

35. For an improvement in *Mills for Sawing Stone*; Joseph L. Dutton, city of Philadelphia, May 22.

This patent is taken for the particular construction of the building in which the sawing is to be effected. In the first place, the floor of the mill is to be raised to such a height from the ground "as to be on a line with the bed of the log or marble teams, by which means most of the expense incurred by unloading, and reloading, is saved." On this elevated floor are placed several short transverse railways, upon which run cars to which the blocks of stone are transferred, immediately from the common teams, and by which they are supported during the operation of sawing.

Above the before mentioned railways, the framework of the building supports other railways, upon which also there is a car furnished with a screw, by means of a chain dependent from which, a block of marble may be suspended and transferred to any part of the mill where it may be wanted. A crane is likewise constructed, which sustains a car similar to that last described, for aiding in the transfer of the stone from one part of the building to another. The arm of this crane is supported upon friction wheels, running upon a suitable curved way, erected for that purpose.

"I claim an exclusive right to the raising of the mill floor, as above described. The traversing car. The application of the upper car to saw mills. The crane, whether applied to saw mills, or for any other purpose; and the regulating spring of the saw slides."

We think that the foregoing claim is very susceptible of improvement. The mere raising of the floor, for the purpose pointed out, we do not think new in saw mills, for we err greatly if we have not seen, in Philadelphia itself, a mill, for sawing mahogany, with the floor so raised

"as to be on a line with the bed of the log" carriage. Nothing is said about any novelty in the traversing car which is to receive the stone, nor do the upper cars differ from such as have been used for raising and transferring loads, for other purposes. The crane is claimed, "whether applied to saw mills, or for other purposes;" now this assuredly does not mean a crane generally, yet we are not told in what particular this crane differs from others; a thing that should not be left to be inferred, but which ought to have been particularly specified. The fact is, that the novelty and utility of the structure consist not so much in the formation of its individual parts, as in the general arrangement and combination of the whole, by which it is adapted to the attainment of the object proposed, and upon this the claim to invention must mainly rest.

San Felipe de Austin, Oct. 26, 1835.

To Dr. John Sibley,

MUCH ESTEEMED SIR:—The very friendly declarations contained in the Resolutions adopted by the citizens of your place at a public meeting over which you presided, have come to us, and we are now under the necessity of calling upon you for the aid so freely and nobly offered. We send you two circulars, containing the last important information, which of themselves ought to be sufficient to excite our friends. We will also inform you that from information received the enemy still expects considerable reinforcements, and have therefore to tender our thanks through you to the meeting, and urge them to use their united influence to hasten the assistance which the destinies of Texas so loudly call for. A few men now may save Texas from sword and fire.—The accompanying please cause to be printed in your paper, requesting all editors friendly to our cause to do the same.

You will be good enough to inform those who will embark in our cause that provision will be made to receive companies at the mouth of Brazos (Velasco,) and their passage from N. Orleans paid; those who come by land will form themselves into companies, and the commander will draw on this council for payment of supplies and all other expenses necessary to a general outfit. Respectfully,

R. R. ROYALL, *President*  
Of the General Council of Texas.

A. HOUSTON, *Secretary*.

San Felipe de Austin, Oct. 26, 1835.

On Motion of D. PARKER of Nacogdoches, it was Resolved,

That the General Council address the people of the United States, making an appeal to their philanthropy in behalf of the people of Texas, whereupon the following address was unanimously adopted, and ordered to be printed and circulated.

R. R. ROYALL, *President of the Council*  
A. HOUSTON, *Secretary*.

# TO THE CITIZENS OF THE UNITED STATES OF THE NORTH.

The General Council of all Texas, by resolution unanimously adopted, have de-

termined to address you in behalf of suffering Texas, and to invoke your assistance.

A few plain facts will suffice to explain to you the political condition in which we are placed, and to satisfy you that we are engaged in a contest just and honorable, and one which should command universal admiration and sympathy.

Our citizens were invited to settle Texas by a government of a republican federal character, having for its model that of the government of the United States of the North. Under that invitation, and the promise of protection to our lives, persons, and property, thousands emigrated here, and have subdued a vast extended wilderness to the purposes of agriculture; and in place of the solitary region inhabited hitherto only by the savage and beast, now present a country prosperous in the highest degree, with a population varying between sixty and one hundred thousand inhabitants, and having on its whole face inscribed one universal assurance of its future greatness and prosperity.

Under this form of government, and this invitation, thousands have brought their property to this country, and invested thousands upon thousands of dollars in lands. They have expatriated themselves from their native country, torn themselves from connections dear, given up the conveniences and luxuries of life, and encountered for years back toils and dangers and privations of every sort.

They have given security to the Mexican frontiers from Indian depredations, and made the mountains the boundary of the savage. And now, when we had accomplished all this, when we had just fairly established ourselves in peace and plenty, just brought around us our families and friends, the form of government under which we had been born and educated, and the only one to which we would ever have sworn allegiance, is destroyed by the usurper, Santa Anna, and a military central government about to be established in its stead.

To this new form of government the people of Texas have refused to submit.—They ground their opposition upon the facts that they have sworn to support the Republican Federative Government of Mexico, and that their duty requires them now to stand out in opposition.

Texas was one of the units that composed the government, by the national constituent congress of 1834. She was acknowledged a sovereign and independent member of the confederacy. As a sovereign member, she voluntarily united in the confederacy that forms the government, and upon the breaking up of that government she has unquestionably the right to accede or to reject the new one that may be proposed.

The one now proposed is in opposition to her wishes, interests, and the education of the people. It protects only the interests of the military and clergy, securing privileges to the one, and intolerance of religion to the other. Such being its character, and our right undoubted, the people of Texas, with one united voice, have rejected the new form of government, and have resolved to abide by their oaths to sustain

the constitution. Public sentiment has already declared that Texas should be organized as a state government under the constitution of 1824, or such other form of government as circumstances may require.

Members to a convention have already been elected, and were to have met on the 15th of the present month. The invasion of the country by General Cos, has however, thus far prevented their meeting, as nearly every member is now in the field of war. At this time our army is besieging General Cos in San Antonio, but he is hourly expecting a large reinforcement, and the people of Texas wait with their once fellow citizens, friends and relations of the United States of the North.

What number of mercenary soldiers will invade our country we know not, but this much we do know, that the whole force of the nation that can possibly be spared, will be sent to Texas, and we believe that we have to fight superior numbers. But we believe victory in the end will be ours. But one sentiment animates every bosom, and all, every one, is determined on "Victory or death."

Citizens of the United States of the North, we are but one people! Our fathers, side by side, fought the battles of the revolution. We, side by side, fought the battles of the war of 1812 and 1815. We were born under the same government—taught the same political creed, and we have wandered where danger and tyranny threaten us! You are united to us by all the sacred ties that can bind one people to another. You are, many of you, our fathers and brothers—among you dwell our sisters and mothers—we are aliens to you only in our country, our principals, both moral and political, are the same—our interest is one, and we require and ask your aid, and we earnestly appeal to your patriotism and generosity. We invite you to our country—we have land in abundance, and it shall liberally be bestowed upon you. We have the finest country on the face of the globe. We invite you to enjoy it with us, and we pledge to you as we are authorized to do, the lands of Texas, and the honor and faith of the people, that every volunteer in our cause shall not only justly but generously be rewarded.

The cause of Texas is plainly marked out. She will drive every Mexican soldier beyond her limits, or the people of Texas will leave before San Antonio the bones of their bodies. We will secure on a firm and solid basis our constitutional rights and privileges, or we will leave Texas a howling wilderness.

We know that right is on our side, and we are now marching on the field of battle, reiterating our father's motto, "to live free or die." And to the people of the United States of the North, we send this assurance, that though numbers may overwhelm us, no other feeling than that of the genuine American glowed in our bosoms, and though danger and destruction awaits us, no friend of theirs prove recreant to his country.

Done in the Council Hall on the 26th day of Oct., 1835.

(Signed) R. R. ROYALL, *President*.  
A. HOUSTON, *Secretary*.

## METEOROLOGICAL RECORD,

For the months of August and September, 1835, kept at Avoyles Ferry, Red River, La., (Lat. 31° 10' N., Long. 91° 59' W., nearly,) by P. G. VOORHIES [Communicated for the American Railroad Journal]

## AUGUST.

Red river fell this month 1 foot 9 inches—below high water mark 7 foot 9 inches.

## AGRICULTURE, &amp;c.

**HORTICULTURAL SOCIETIES AND AGRICULTURAL FAIRS.**—We take the following account of the meeting of the Ontario and Wayne counties Horticultural Society, from the Geneva Courier. The meeting was held at Blossom's Hotel, in Canandaigua, on the 30th of September. We omit the list of premiums, giving merely that part of the proceedings which may be of service to others; and we would call especial attention to the statement made by Mr. Samuel M. Hopkins, in relation to the "nature and cause of Mildew" of the Grape—it will at least be found interesting, and we hope valuable to our wine growing friends.

The fruits, vegetables, and flowers were arranged for exhibition, on tables in the dining-room of the hotel, the walls and ceiling of which had been dressed and decked in a very tasteful way, by the excellent gardeners in the employ of Messrs. Greig, Duncan, and Blossom, with a drapery gathered from forest, orchard, and garden, beautifully appropriate, and variegated with the rich dyes of autumn, among which, hung up at various intervals, were seen double pears, twin plums, apples in great clusters, and other anomalies of vegetation.

The committee were engaged in their examinations and in adjudging premiums, from about 12 till a little after 1 o'clock, and the premiums were announced after dinner.

After this report, Mr. Hopkins gave an exceedingly interesting statement of various experiments, which he had made during the past season, on the management of grape vines, with a special reference to the ascertainment of the nature and cause of Mildew. The statement was wholly oral, and it is impossible to give a full and exact report of it here: though the general conclusion, which Mr. H. drew from his experiments, was that the mildew of grapes was analogous to the rust of wheat; that is, an exudation, or oozing out, of the juice of the young grape through its tender skin, bursts in the very early stages of its growth, by excessive stimulation by too high manuring, and then acted on by the intense heat of our American summer sun. Mr. H. had examined the grapes, in all stages of their progress, with a microscope, and was entirely convinced that he was right, as to the nature of mildew, and believed that he had ascertained one of its causes, if not its only one. He exhibited samples of clusters taken from different parts of his vines, to illustrate his positions and exemplify the effects of his different modes of management. He considered that the treatment, indicated by his experiments, was to avoid high manuring, and to prune little, or none, so as to leave to the clusters the shelter of all the shade the vine can furnish, and even to train the vines on trees for the sake of additional umbrage, as the custom has always been in Italy. On this point, Mr. H. referred to the natural habits of the grape, and to the methods of culture pursued in the more sunny regions of sunny Europe, and thought that our modes of treatment should be drawn from those climates, as being more like our own, rather than from countries many degrees north of us, as England and Scotland, where the humid, chill, and unsunned atmosphere about the vines, render

ed much stimulation and pruning necessary.

Such is a very succinct, but, it is believed correct, outline of the views presented by Mr. H. Before the society adjourned a resolution was passed, requesting Mr. H. to furnish a detailed and full statement of his experiments and views on this subject for the press.

The following are the officers for the ensuing year:

John Greig, President; Samuel M. Hopkins, Wm. H. Adams, Oliver Phelps, Wm. S. De Zeng, Alexander Duncan, Abraham L. Beaumont, Vice Presidents; Joseph Fellows, Treasurer; O. L. Holley, Corresponding Secretary; Z. Barton Stout, Recording Secretary.

The Corresponding Secretary was directed to prepare a circular on behalf of the Society, and have 300 copies printed, for distribution in the counties of Ontario and Wayne, in the hope of enlarging the numbers of the Society and extending its usefulness.

It was resolved that the next June meeting be held at Lyons, and that Wm. H. Adams be Chairman of the Committee of Arrangements for said meeting, the day and place of which to be seasonably advertised in the newspapers.

Z. BARTON STOUT, Rec. Sec'y.

## AGRICULTURAL CONVENTION.

Believing that important benefits may result from the deliberations of a State Agricultural Convention—that a moderate appropriation of public money, to induce emulation, to reward merit, and to diffuse useful knowledge in the arts of productive labor, would tend essentially to advance our prosperity, and to improve and elevate the character of our State; and knowing that the concert of many can alone insure success in the most laudable undertaking,—the subscribers respectfully invite a convention of gentlemen, desirous of giving a new impetus to agricultural improvement, either individually, or as delegates from towns and counties, at the City Hall, in Albany, on the second Monday in February next.

AGRICULTURAL CONVENTION.

It will be seen, by the notice inserted in to-day's Cultivator, that an Agricultural Convention is proposed to be held in Albany, on the second Monday in Feb. next.—The notice has appended to it the names of many highly respectable citizens, to whom the proposition was submitted—enough to give to it all the weight and consequence which is desirable in a preliminary measure. This is the era of conventions; and when their object is praiseworthy, they are seldom otherwise than beneficial. They tend to bring about a concert of action, and to concentrate the energies of many for the accomplishment of a common good. And if the agricultural community can in this way do any thing to advance their interests, we may rest assured that the State will be benefited, so intimately is the prosperity of the first identified with that of the latter. The discreet farmer must graduate the extent of his purchases from the merchant, manufacturer, &c., by the net profits of his farm. If he can double these profits, as we feel assured may be done, the other classes of society will be correspondingly benefited.

There are many topics which present themselves as worthy the consideration of an Agricultural Convention, and in which the whole community have a deep interest. We will endeavor to point out some of the more prominent ones.

1. *The establishment of a School of Agriculture.* "It remains to us," says Chaptal, "to improve agriculture by the application of physical science. All the phenomena which it presents, are the consequences necessarily resulting from those eternal laws by which matter is governed; and all the operations which the agriculturist performs, serve only to develop or modify these causes. It is, then, to the acquisition of a knowledge of these laws, in order to calculate their effects, and modify their action, that we ought to direct our researches." These laws relate not only to the organic and ponderable matters with which we have to do, as animals and vegetables, earths and manures, but to light, heat, and moisture, which exercise a controlling influence over animal and vegetable life. "Discoveries made in the cultivation of the earth," it is well remarked by Davy, "are not merely for the time and country in which they are developed, but they may be considered as extending to future ages, and as ultimately tending to benefit the whole human race; as affording subsistence for generations yet to come; as multiplying life, and not only multiplying life, but likewise providing for its enjoyment." And if the sciences, as is often asserted, are worthy of our ardent pursuit, merely on account of the intellectual pleasures they afford—"by enlarging our views of nature, and enabling us to think more correctly with respect to the beings and objects around us,"—how much more worthy are they of our regard, when employed to multiply the products and profits of human labor—to increase the comforts and happiness of the human family.

But it is not desired to make mere scientific farmers, but intimately to blend the practice, and the best practice, in all the departments of rural labor, with the theory, and to test and correct the one by the other. In the plan of a school which has been partially promulgated, it is set down as an indispensable rule, that during the seven farm-

ing months, both teachers and students shall devote at least one half of the time to the practical labors of the field, the garden, or the mechanic's shop. The plan has been objected to on the ground, that few, comparatively, can become its inmates. The same objection exists to all our higher literary schools; not one individual in five thousand receives instruction in our colleges; and yet it would subject one to ridicule to contend, that these colleges do not exercise a highly salutary influence, indirectly, upon the best interests of the community. So of our canals and public improvements; they do not directly benefit property where ample facilities of commercial intercourse previously existed—they have in fact comparatively and seriously diminished the value of real estate in some districts; yet no one doubts their utility to the community at large. Besides, should the predictions of the usefulness of agricultural schools be verified, schools of the kind can be readily multiplied.

The pupils of an agricultural school would not only carry with them into business life, those principles of science, and that general knowledge, which would be calculated to improve our husbandry, and to add to the stock of general knowledge—but they would carry with them, and disseminate, practical knowledge, in all the departments of agricultural labor. They would carry with them a knowledge of the various breeds of farm stock, of their relative value—of the diseases to which they are incident, and the methods of treating them, when well or sick—a knowledge of the nature and proper management of different manures—of the principles and methods of draining and irrigation—of the principles and value of alternating crops—of the best varieties of fruits and culinary vegetables, and the modes of propagating, cultivating and preserving them—a knowledge of all new plants, profitable in our rural culture, method of treatment, the soils to which they are adapted, and mode of preparing for market—of the leading principles of mechanical science, highly essential in the construction and management of farm implements. They would carry with them, also, habits of application and reflection—hands inured to labor, and minds imbued with light and truth, and animated with an ardent desire to obtain distinction for usefulness. The example of a good farmer exerts a magic and benign influence upon all around him. His light is not hid under a bushel; but shines forth to illuminate and instruct all who are within its influence. Who will set bounds to the benefits which would result from annually locating one or two hundred such pupils in various parts of the State?

2. *The standard of instruction in our common schools should be rated, to fit the pupils for the high duties and responsibilities of freemen, and to aid them in their future business of life.* This is required, as well by political and moral considerations, as by a desire to keep pace, in the arts of labor, with the improvements of the age. The preservation of our civil rights depends upon the intelligence and independence of the middle class of society—the pecuniary prosperity of our State upon their habits of profitable industry. It is in our common schools that we are to lay the foundation of this intelligence and independence, and to inculcate principles and habits of useful industry.

The reports from our penitentiaries furnish us with two remarkable facts, viz., that of 180 convicts, in the Connecticut state-prison, "there is no one who, before his con-

viction, could read and write, and who was of temperate habits, and followed a regular trade"—and that "there never has been, in that prison, a convict who had received either a collegiate or classical education." Volumes could not enforce more strongly the propriety of adopting a high standard of common school instruction, nor urge stronger considerations for multiplying incentives to honest labor. These matters come within the special province of the agricultural class, who must, from their numbers and influence, give the impress to our character, so long as our freedom shall survive. How little is now done in our common schools to instruct the boy in his future business of life, or in his civil rights and responsibilities!

The importance of the middle class of a population, under a free government, is forcibly shown in the following extract, which we make from Sismondi's History of the Fall of the Roman Empire.

"But one effect," says this historian, "of the long duration of states, and of their extended power, is to separate the inhabitants into two classes, between whom the distance is constantly widening, and gradually to destroy the intermediate class, together with which all the social virtues are gradually uprooted and annihilated. From the time that this gulf is once opened between the two extremes of society, every successive revolution does but continue to widen it; the progress of wealth had been favorable to the rich, the progress of distress favors them still more. The middle class had been unable to stand the competition with them during prosperity; in adverse times it is crushed under those calamities which only the wealthy can stand against. The corruption of Rome had begun from the time of the republic, from the time that the middle class ceased to impress its own peculiar character on the whole nation; this corruption increased in proportion as the intermediate ranks disappeared; it was carried to the highest pitch when the whole empire consisted of men of enormous wealth, and populace.

"It is, in fact, in the middle classes that the domestic virtues,—economy, forethought and the spirit of association,—mainly reside. It is in them that a certain degree of energy is incessantly called into operation, either as a means of rising, or of keeping the position already acquired. It is in them that alone the sentiment of social equality, on which all justice is based, can be kept alive. We must see our equals, live with them, and meet them daily and hourly, encounter their interests and their passions, before we can get the habit of seeking our own advantage in the common weal alone. Grandeur isolates a man; vast opulence accustoms each individual to look upon himself as a distinct power. He feels that he can exist independently of his country; that his elevation or his fall may be distant; and, ere long, the servile dependents, by whom a man who spends as much as a petty state is sure to be surrounded, succeed in persuading him that his pleasures, his pains, nay, his slightest caprices, are more important than the welfare of the thousands of families whose means of subsistence he engrosses.

"The morality of a nation is preserved by associating its sentiments with all that is stable and permanent; it is destroyed by whatever tends to concentrate them on the present moment. So long as our recollections are dear to us, we shall take care that our hopes be worthy of them; but a people who sacrifice the memory of their ancestors, or the welfare of their children, to

the pleasure of a day, are but sojourners on a country—they are not citizens."

3. *A portion of public money may be usefully applied in aid of county agricultural societies, to call forth talent and to excite industry.* Of the salutary effects of premium rewards, for skill and enterprise in agricultural improvement, we have testimony enough in the experiment which our State made in 1817, and which is yet exerting a beneficial influence among us. We see it confirmed also in the States which surround us, some of which have for a long time been liberal of their funds to this object, while others, yet in their infancy, have recently began to copy the provident example. There is no country which has made greater advances in improved husbandry, during the last fifty years, than Scotland, and there is none perhaps which now excels her. Her Agricultural Society has been in existence about fifty-one years, and in that time has distributed, to the tillers of the soil, premiums to the value of about half a million of dollars. The value of her agricultural products has been augmented, in the mean time, several millions annually. Who will deny, that her premiums have contributed largely to bring about this wonderful improvement in Scotch husbandry? The remarks of Chaptal upon this subject, inserted in our October number, are so pertinent and forcible, that we beg leave to refer to them, as further illustration upon this head.

4. *We want better Common Roads.*—The existing laws are defective, or they are not faithfully executed. Nothing tends so rapidly to improve and enrich a district, as good roads. The profits of agricultural labor, as well as the stimulants to industry, are increased by every new facility for transporting its products to market. The attention of our legislatures has been so much engrossed by party politics, private claims and monied incorporations, as to leave little time to deliberate upon the matter, and to digest a better system. In truth, a goodly portion have been strictly political or professional gentlemen, whose study has been more to improve the road to office, and the road to preferment, than the common roads of the farmer. Plans of improvement have been suggested, and we are advised that some of these will probably be submitted.

5. We have a formidable enemy in the *Canada Thistle*, which it requires the united efforts of all landholders to put down, aided by legal penalties. Lastly,

6. The serious depredations of the *Grain-worm* upon the wheat crop of some districts, and the apprehended danger that it will extend itself over the State, is a matter highly worthy the consideration of an Agricultural Convention.

We have thus suggested some prominent subjects which may engage the attention of an Agricultural Convention, of manifest importance to the farmer and the public. Whether all or any of them will be discussed, it is not our province to say. And we will close our already too protracted remarks, by calling upon the agricultural interest in the several counties to weigh the matter with all deliberation, and if they concur with us in the belief, that much good may result from the proposed meeting, to give it their cordial and efficient support. We would in particular address those who are just entering upon the stage of business life—who are anxious not only to acquire fortunes, but reputations for public usefulness, and who are to give a character to our agriculture in coming years. "Nothing," said an ancient sage, "can be more despi-

cable than an old man, who has no other proof of having lived long in the world than his age." "It should be the object of our ambition that we should all signalize the period of life allotted to us, by some exertion, either mentally or bodily, which may be useful to mankind, and give us a claim to their remembrance, to their respect, and to their gratitude."—[Cultivator.]

The following short treatise on the Management of a Kitchen Garden is from the pen of Charles F. Crossman, a member of the Society of Shakers. In it will be found much that is useful, at least to some of our readers.

#### MANAGEMENT OF A KITCHEN GARDEN.

Previous to commencing the work of the garden, a few matters essential to success should be particularly attended to. In laying out a garden on an oblong form, it will generally be found most convenient to have the rows of vegetables run lengthwise of the garden, so that the plough or cultivator may run through freely, without interruption, allowing an alley at each end for the horse and plough to turn round upon: The ground should be ploughed or dug to a good depth, especially for long rooted plants, and be well incorporated with rotten manure or rich compost. The essential advantage of deep ploughing is not only best calculated to give room for the roots to expand freely, but the crops on a deep ploughed soil will be much less liable to injury from the extremes of wet and dry weather. Every garden should have a good supply of well rotted manure or old compost, ready for use when wanted; also a portion of soot, tobacco dust, ashes and lime, for the purpose of scattering over seed beds and hills of plants in dry weather, to destroy insects, which often cut off the young plants as fast as they come up.

The next matter of importance is, to work the ground and put in the seed when it is in proper order to receive it. A light, sandy soil will be benefitted by working it when moist, as this will have a tendency to make it more compact, and better adapted to retain its moisture; but if a clay soil be worked when too wet, it will become hard and stiff, and not only prevent the seeds from rising freely, but materially injure the plants in their subsequent growth. Rolling or pressing the earth over the seeds, will tend greatly to promote their vegetation, especially when the soil is loose and dry; but when moist and heavy, if done at all, it should be done very lightly.

If the ground be very dry at the time of sowing, let the seed be soaked a few hours in water strongly impregnated with sulphur or soot, and keep the ground moist by frequent watering: This will have a great tendency to forward the vegetation and prevent the ravages of insects.

Transplanting is generally attended with the best success when performed immediately after the ground has been newly ploughed or dug; as it will then work light, and the moisture arising from newly stirred ground is highly beneficial to the growth of young plants. If the soil of the bed be dry when the plants are to be taken out of it, let it be watered freely, and then raise the plants carefully with a trowel or a flat-pointed stick; and before setting them out, dip the roots into a mixture of rich mould or rotten manure and water, with the addition of a little lime or ashes, and reduced to the consistence of thick whitewash. This preparation is found highly beneficial to the

young plants of cabbage, turnips and others when transplanted, by promoting their growth and preventing their roots from being injured by destructive insects. In setting young plants, the earth should be pressed a little over the roots, and raised around the stem, sufficient to support the plant, and prevent it from falling or leaning aside. The ground should be stirred often, and kept loose and light by frequent hoeing through the season.

A good garden, well supplied with useful vegetables, in a healthy, thriving state, kept neat and clean from weeds, affords a striking evidence that the cultivator possesses a good portion of wisdom and economy, and is attentive to his business; but when I see a garden containing a small quantity of such as are evidently from good seed, promiscuously planted, without order or regularity, faintly struggling among the weeds for existence, I readily conclude that the proprietor's mind needs cultivation, and that some noxious weeds of domestic or foreign growth have taken deep root there, which will require the strong hand of an industrious and persevering cultivator to eradicate.

The numerous benefits afforded to a family from a well cultivated garden are too little considered by many of our country farmers, for their own interest and the health and prosperity of their families. The cheap and healthy varieties which may be furnished, (much less expensive, and far more healthy than the same quantity of meat without vegetables,) the pleasing and healthy exercise and enjoyment attending their cultivation is beyond description: indeed the cultivation and produce of a good garden are the life and health of a family, upon every principle of rational enjoyment and temporal economy.

1. *Asparagus. F Asperge. S. Espargago.\**—This is a very delicious vegetable, and easily cultivated, after the first operation of preparing the ground. It requires some of the deepest soil in the garden: a rich, sandy loam is the best. The ground should be trenched or spaded up, and a plenty of rotten manure well mixed into the soil to the depth of one foot and a half. Then mark out your beds six feet wide, forming two feet alleys around them, by throwing up six inches top soil on the beds. Next use the rake and hoe, till the ground is well pulverized and made level and smooth. Then mark out your drills one foot apart and two inches deep. Soak the seed twelve hours in warm water; drop it about one inch apart in the row; rake it in, and press the soil over the seed with a board or garden roller. When the young plants are up, hoe them carefully, and keep them clear of weeds through the season. After the second hoeing, pull out the weakest plants, leaving them about four inches apart.

A bed of asparagus, well managed, will produce buds fit for cutting the third spring after sowing. The buds should be cut one inch or more below the surface of the ground. The cutting may be continued until the first of July; then let it grow up, but hoe it frequently till it covers the ground.

*Spring dressing.* As soon as the ground is dry, so as to work light, separate the stalks from the ground with a hoe, cutting them off beneath the surface, and loosen the surface of the ground all over the beds. Some dry straw, little or fine brush may be added to these stalks when dry, and the

\* The French and Spanish names of the various vegetables are added to our common English names, and marked with the letters F. and S., for the information of foreigners who purchase our seeds.

whole burnt together on the ground. This will promote the growth of the asparagus, and destroy many insects' eggs, seeds of weeds, &c. The ground should then be covered one inch or more with rotten manure or compost, well incorporated with the soil above the roots; then rake the beds smooth and level. An application of swamp earth, salt or brine spread on the beds, has been found to promote the growth of asparagus.

Though this vegetable grows naturally in a poor, sandy soil, yet the sweetness and tenderness of the buds depend much on the rapidity of their growth, which is greatly promoted by richness of soil and good attendance. Beds of asparagus may be formed by preparing the ground, as before stated, and transplanting the root of two or three years' growth, setting them with the crown upwards, four inches below the surface.

A good bed of asparagus, if well attended to, will flourish many years; ours occupies one-eighth of an acre of land, the greater part of which has been planted more than forty years, and is now as good as ever.

**Directions for cooking asparagus.** Cut the buds when from three to six inches high; clean them well in cold water, cutting off most of the white part, as that which grows beneath the surface of the ground is apt to be tough and bitter. Take water enough to cover the stalks, and put in salt sufficient to season them well; boil and skim the water, then put in the asparagus. Be careful to take them up as soon as they become tender, so as to preserve their true flavor and green color; for boiling a little too long will destroy both. Serve up with melted butter or cream.

**2. Beans. F. Feve. S. Haba.**—A dry, warm soil, tolerably rich, is the best for beans. The ground should be worked fine and mellow. Plant, for early use, from the 20th of April to the 1st of May. The early kinds may be planted in drills two and a half feet apart, and at the distance of three inches in the row, or in hills a foot apart.

The *Early Purple* is the earliest bean, and consequently preferred for early use. The *Early China* and *Early White* are excellent, either for stringing or shelling; they will be fit for use, if the season is favorable, in about six weeks for planting. The *Royal White* is a large, rich bean, excellent for shelling. This kind should be planted in rows three feet apart, and if in hills, two feet from each other, with four beans in a hill; if in drills, six inches apart in the row. The *Running* or *Polé Beans* should be planted in hills, three and a half feet distant each way. They should be planted as early as possible, in a rich, mellow soil. We prefer setting the poles before planting. For this purpose we stretch a line, and set the poles by it; then dig and loosen the earth, and drop five or six beans in a circle round the pole, about three inches from it, and cover with mellow dirt one inch or one and a half in depth. When the plants are well up, stir the earth around them, and pull out the weakest plants, leaving three to each hill. This should be done when they are perfectly dry; for beans never should be hoed when wet, nor when any dew is on them.

The green pods of beans may be kept and preserved fresh by laying them down in a jar or tub, with a layer of salt between each layer of beans.

**3. Beet. F. Betterave. S. Betarraga.**—Prepare your ground as early in the spring as it will work light and mellow, by ploughing or digging to the depth of eighteen inches. A deep rich soil produces the finest roots. If a small bed of the earliest kind

is sown as early as the season will admit they will be fit for use in June. After making your beds fine and smooth, mark out the drills eighteen inches apart, and one inch deep; drop the seeds along the drills, two inches apart; cover them, and press the soil a little over the seeds. When the plants are up and sufficiently strong, thin them to the distance of six inches apart in the rows. The ground should be often hoed round the plants, and kept free from weeds. Beets for early use, should be sowed about the first of May; for winter use, two or three weeks later, the beds kept clean through the summer, and the roots taken up before hard frosts in the fall. Care should be taken in cutting off the tops, not to injure the crown.

A good method of preserving beets fresh through the winter is, to lay them in a circular form on the bottom of the cellar, with the roots in the centre and heads outward; cover the first course of roots with moist sand; then lay another course upon them, and cover with sand as before, and so on till all are packed and covered.

The *Mangel Wurtzel* and *Scarcity Beet*, also the *Yellow Swedish* or *Ruta бага* turnip, are often raised to great perfection by field culture, for which we give the following directions:

**Field culture.** Select a deep mellow soil; if not sufficiently rich, make it so with well rotted manure, thoroughly mixed with the soil to the depth of a foot or more. This should be done by ploughing and harrowing when the ground is in good order to work light and fine. You may then throw up moderate ridges with the plough, about the distance of three feet apart. Pulverize and level the top of the ridges with a rake. Then, with a dibble or with the fingers, make holes on the centre of the ridge, two inches deep, and eight inches apart; and for beets, drop two seeds in each hole, and cover with fine dirt, pressing it a little over the seed. For the *Swedish* or *Ruta бага* turnip, we generally prefer sowing the seed in a bed of light, mellow soil, from the 1st to the 10th of July. After having attained a sufficient size for transplanting, the ground being prepared as above directed for beets, set the plants about ten inches apart in the row; while the plants are young, the ground should be often stirred around them, and kept clean from weeds through the season. The horse plough should be often used between the rows, especially in dry, hot weather.

The average crop of these roots, on good land, with proper management, is about fifteen tons to the acre. The quantity of seed required for the *mangel wurtzel* or *scarcity beet*, is about four pounds to the acre; for the *Ruta бага* or *Swedish* turnip, about one pound and a half. To quicken vegetation, the beet seed in particular, should be soaked twenty-four hours in the water.

There are various methods of field culture recommended and practised by different people. Some sow the seed broad cast; others in rows on level ground, from ten inches to four feet apart; some sow or transplant on moderate ridges, and others on very high ridges. But those who have had most experience in this branch of agriculture, will doubtless find their own experience and judgment the most successful guide; and those who have not, may follow the directions we have given, with such deviations as the nature, situation and circumstances of their soil, according to their best judgment, may require; and experience will doubtless prove the best teacher in the end.

These roots are highly and justly recommended for feeding milch cows in the fall and winter, & especially in the spring, if well preserved; also for fattening beef and pork. If fed in the raw state, they should be cut fine; if boiled, a little Indian meal or bran may be mixed with them.

**4. Cabbage. F. Chou. S. Col.**—This vegetable requires a light, rich, and rather moist soil. The seed may be sown about the middle of May, either in a bed for transplanting, or where they are intended to grow. The transplanting should be done when the ground is light, just before a shower, or in cloudy, moist weather, but never when the ground is wet and heavy. Before transplanting, dip the roots into a mixture made of rich mould and water. They should be hoed often while young, at least twice a week; the best time for hoeing is when the dew is on. If lice should appear on the plants, wet them with a strong decoction of tobacco, put on with a small brush, or rubbed on with the hand.

Cabbage should be secured before very cold weather, and their roots buried in the dirt; but never let them rot in a cellar under your dwelling house, unless you wish to destroy the health of your family.

**5. Cauliflower. F. Chou fleur. S. Cauliflor.**—This requires the best of rich, light soil. The early kind is most suitable for this climate. It should be sown about the 20th of September, for spring use; and it requires much care to keep them during the winter. For fall use, they may be sown in a hot bed in March, or in the open ground about the 20th of May. They should be protected from the northwest winds by walls or hedges, and great pains must be taken in every stage of their growth, as the extremes of heat and cold operate very unfavorably upon them.

**To cook Cauliflower.** Cut it when close and white, and of a middling size; cut the stem so as to separate the flower from the leaves below it; let it lie in salt and water a while; then put it into boiling water, with a handful of salt. Keep the boiler uncovered, and skim the water well. A small flower will require fifteen minutes boiling—a large one, about twenty. Take it up as soon as a fork will easily enter the stem: a little longer boiling will spoil it. Serve it up with gravy or melted butter.

**5. Carrot. F. Carotte. S. Zanahoria.**—The long orange or red is generally preferred, both for garden and field culture: the short orange is the earliest and deepest color.

**Soil.** Carrots require a light, mellow soil, with a mixture of sand. The ground should be dug or trenched deep, and well broken up, in order to give plenty of room for the roots to penetrate into the soil; it should also be made fine, smooth and level.

**Sowing.** As the seeds have a fine, hairy furze on the borders or edges, by which they are apt to cling together, they should be well rubbed between the hands in order to separate them. To forward vegetation, they should be soaked in warm water about twenty-four hours, and then mixed with dry sand, so as to separate them as much as possible in sowing. They should be sown in a calm time, and scattered as equally as possible.

The seed should be sown in drills about an inch in depth; the rows from eighteen to twenty inches apart, so as to give plenty of room to hoe between them. Some recommend from nine to twelve inches, and others from eight to ten: this may answer in small family gardens, where the land is scarce; but where there is a sufficiency of ground, the carrots are more easily cultiva-

ted, and will thrive better and grow larger at a greater distance.

**Field Culture.**—The best soil for field carrots is a deep, rich, sandy loam. To obtain a good crop, the soil should be a foot deep at least, and well prepared by very deep ploughing and thorough harrowing, so as to make the ground perfectly mellow, smooth and level. It is a matter of importance to wet the seed and cause it to swell, so as to hasten vegetation; because the weeds are apt to start very quick after sowing, and if the seed is not quickened, the weeds will get up and overpower the carrots, before they get large enough to hoe. The seed may be sown in drills, as directed for garden culture or on moderate ridges, from two to three feet apart, and cultivated between the rows with a horse plough. In hoeing, they should be thinned to three or four inches apart in the rows. Two pounds of seed is considered sufficient to sow an acre of ground in drills two feet apart.

Carrots are excellent for fattening beef, and for milch cows, horses are remarkably fond of them. When cut up small, and mixed with cut straw and given them, with a little hay, it is said they may be kept in excellent condition for any kind of ordinary labor, without any grain.

**7. Celery. F. Celeri. S. Apio.**—The *White Solid* is considered the best kind of celery. We have had the best crops by sowing the seed the latter part of March, in a hot bed. After the plants have attained the height of about six inches, they may be transplanted into trenches. Select for this purpose, a piece of rich ground, in an open exposure; lay out your trenches about eighteen inches wide, allowing six feet space between each trench; plough or spade out the earth from the trenches to the depth of sixteen or eighteen inches, if the depth of soil will admit; put about three inches of very rotten manure into the trench; then throw in upon this manure about five inches of the best soil; mix and stir the manure and soil well together; then set your plants by a line in the centre of the trench, leaving a space of four inches between each plant. If the weather be dry, water the plants freely. They should be shaded till the roots strike and the plants begin to grow; the covering should be taken off at night.

When they have attained the height of ten inches, you may commence earthing them up; but never do it while the plants are wet. In performing this, care should be taken to gather all the leaves up with the hand while drawing the earth up equally on each side of the row, being careful to leave the hearts of the plants open. Repeat the earthing once a week or oftener, till about the last week in October; then bury the whole with dirt, to remain till time of digging.

Celery may also be raised by sowing the seed in a rich, moist soil, and removing it into trenches as before directed; or by sowing it in the trenches where it is to grow. As the seed vegetates very slowly, it should be soaked, in warm water for twenty-four hours before sowing. To preserve it through the winter, dig it before the ground freezes deep, and pack it away in casks or tubs with dry sand, and keep it in the cellar.—Some recommend to cover the ridges with boards, and dig the celery as it is wanted for use. This may answer in a dry, sandy soil; but in a wet or moist soil it is apt to rot and spoil.

**8. Corn. F. Mais. S. Maiz.**—The *Early Canada* is the earliest kind of corn we raise, and is preferred only for being several weeks earlier than the common field corn. The *sweet* or *sugar* corn is the best

for cooking in its green state, as it remains much longer in the milk, and is richer and sweeter than other kind. It is rather later than the common field corn, and is therefore fit for the table when the field corn has become too hard. Alluvial, or any gravelly or sandy soil, if made sufficiently rich and properly cultivated, will produce a rich crop. It should not be planted till the weather becomes settled and warm, and the soil sufficiently dry. It may be planted in hills, like the common field corn, or in a garden in drills, like broom corn; as in this way a larger crop may be produced from the same quantity of ground. Care should be taken that no other kind of corn be planted near it, as by intermixing, it will soon become adulterated and injure the crop. This corn may be preserved for winter use, by par-boiling it when green, and cutting it from the cob and drying it in the sun. It then affords a wholesome and agreeable dish when cooked like bean porridge, or what is called *succotash*.

**9. Cucumber. F. Concomber. S. Cochambro.**—The early kinds are most suitable for early planting. For the purpose of obtaining them very early, some plant the seed in a hot bed, or in elevated hills, well manured with rotten horse-dung, and covered with glazed frames. But in order to grow fair, handsome cucumbers, the soil should be rich, light and warm, and well mixed with rotten manure; or a good shovel full may be put into each hill, and thoroughly mixed with the soil in the hill. We generally plant the early kinds about the first of May, in hills about four feet apart each way, elevating the hills a little above the level of the ground. Put in six or eight seeds into each hill, and cover them half an inch deep with fine dirt, and, as in all other planting, press the earth a little over the seeds with the back of the hoe.

When the plants are up, examine them closely, as they are frequently attacked by the yellow bug or fly. To prevent this, take rye flour, sifted ashes and ground plaster, equal parts of each, well mixed together, and dust the plants all over with it. If the plants are dry, sprinkle them with water before you dust them. Snuff, tobacco dust, or the stalks boiled in water, soot, or a decoction of elder and walnut leaves, are all very good to prevent small bugs and insects from injuring any young plants. Keep the ground loose and clear of weeds, and in dry weather, water your plants freely. After they have attained a vigorous growth, and the danger from insects is over, they may be thinned out, leaving two of the most thrifty in a hill.

Those intended for pickling may be planted from the 10th to the 20th of June. If the soil is rich and warm, the 20th is preferred. The long kinds are preferred by some for pickles. The cultivation and management of these is the same as the others excepting that the hills should be at least five feet apart each way. Some gardeners recommend nipping off the first runner bud of cucumbers and melons, from an idea that they will become more stocky and fruitful.

**10. Lettuce. F. Laitue. S. Lachuga.**—Lettuce requires a mellow soil. It should be sown as early in the spring as possible: to insure a very early supply, it may be sown late in the fall—it will then start early in the spring; but to obtain a constant and regular supply through the season, it should be sown broad-cast, moderately thin, or in rows from twelve to eighteen inches distant, according to the usual size of the different kinds. Rake in the seed lightly, with a fine tooth garden rake. When the plants are up, stir the ground lightly while

it is dry, and clear out the weeds: thin the plants where they crowd each other. Those intended for large heads should stand eight or ten inches apart: the hardy kinds, such as the *early green*, *early curled*, and *ice coss*, may be sown in September, and covered with straw at the approach of severe weather. Or any kind may be sown in a hot bed in March, and transplanted in the open ground at the proper season.

**11. Melon. F. and S. the same.**—This plant requires a warm gravelly or sandy soil, made very rich with well rotted manure from the hog-pen, or rich old compost, well mixed with the soil. The hills may be formed after the manner recommended for cucumbers. But if the natural soil is not sufficiently warm for melons, then dig a hole of sufficient size, and put in a large shovel full of rotten horse dung; upon this put the compost or rotten hog dung, with a quart of slacked lime: then add some good mellow soil, and mix it up well on the surface without disturbing the horse dung at the bottom. The hills may be made from six to eight feet apart: for water melons, on rich, warm land, where they grow most thrifty, nine feet is near enough.

Plant about the middle of May, if the weather be warm and the ground in good order. The seed should be soaked a few hours in warm milk and water, with a little soot in it. Put six or eight seeds in a hill, and cover half an inch deep. When the plants become strong and thrifty, so as to be out of danger, pull out the weakest, leaving only two in each hill; indeed one would always be sufficient, if secure from all accidents. The ground should be often hoed round the hills, and kept loose and light. If you would raise good melons, you must plant them remote from any other vines; for in the vicinity of cucumbers, squashes, pumpkins, gourds and the like, they will infallibly degenerate. In this respect, therefore, they require great care and attention. To secure them from the ravages of insects, pursue the directions given for cucumbers.—[See cucumber]

(To be continued.)

The most remarkable result of barometrical measurement was recently obtained, by Baron Von Humboldt, showing that about 18,000 square leagues of the north-west of Asia, including the Caspian Sea and the Lake of Aral, are more than 320 feet below the level of the surface of the ocean in a state of mean equilibrium. This enormous basin is similar to some of those large cavities on the surface of the moon, and is attributed by Humboldt to the upheaving of the surrounding mountain chains of the Himalaya, of Kuen-Lun, of Thion Chan, to those of Armenia, of Eterum, and of Caucasus, which, by the undermining of the country to so great an extent, caused it to settle below the usual level of the sea. The very contemplation of the destruction which would ensue from the bursting of any of those barriers which now shut out the sea, is fearful.—[Mrs. Somerville.]

**Mexico.**—According to the New Orleans Bee of 24th ult., the closing of the Mexican ports, heretofore alluded to, was only a partial and not a general measure, and had not been sanctioned by the Central Government. The Bee adds, "the ports of Mexico are now open to our trade, and greater tranquillity prevails in that country, than we had anticipated."

SUMMARY.

From the New-York American.

COMMENCE OF FRANCE.—In the Journal des Debats of 27th Nov., we find an examination of the official Custom House returns of the commerce of France for 1834, the results of which are presented in the annexed tabular form.

Table of the Imports and Exports of France.

Countries whence Imports, and to which Exports, are made.	Value of merchandise imported in France.	Value of merchandise exported from France.
	fr.	fr.
Russia	17,600,028	6,910,547
Norway	10,617,146	1,328,792
Prussia	12,511,543	7,025,998
Hanseatic Cities	4,307,259	10,447,935
Holland	7,271,321	13,743,508
Belgium	51,539,596	27,661,817
Egypt, including Gibraltar, Malta and the Ionian Isles	27,095,068	62,431,586
Spain and Canaries	21,251,133	33,130,581
Sardinia	82,816,252	30,331,464
Scilly	11,038,548	5,839,629
Switzerland	12,713,348	29,833,960
Germany	21,493,123	36,079,117
Tunkey & the Archipelago	10,835,093	10,591,614
British India and S. Wales	16,135,001	4,392,508
United States	76,363,796	78,136,275
Brazil	6,212,953	18,937,108

Annexed to this table, are the following observations, which we translate, of the writer in the Journal des Debats. "What will first attract notice in this table, are the columns which indicate the importance of our commerce with the United States. We were prompted to look into the returns for 1833, to ascertain our then relations, and we found that the importations thence into France amounted to twenty-three millions eight hundred and eighty-five thousand francs—not varying much from those of 1834; but our exports thither reached one hundred and seven millions, nine hundred and eighty-four thousand francs. It is reasonable to suppose that the apprehensions of war between the two countries, have had their full influence in bringing about so striking a reduction of our exports: but even in the actual amounts stated in the above table, enough exists to show to each, how much they would lose by a bloody controversy: and this consideration alone will keep them at peace. At least it is fair to assume this ground, until it shall be demonstrated, that of two alternatives, the most absurd one is that, which two great nations must necessarily embrace."

Copy of General Rule adopted by the Supreme Court, 5th January, 1836.

"When a writ shall be brought, pursuant to 2 R. St., 457, §1, by a foreign corporation, security shall be given by Bond, executed by two persons, in the penalty of \$500, conditioned to pay all costs which may be awarded to the defendant, which bond shall be filed with the writ or declaration, by which the suit shall be commenced. The defendant may except to such sureties, and they shall justify according to the practice. 2 R. St., 620."

Gov'r. Ritner, of Pennsylvania, has vetoed a resolution passed by both houses, for the purchase of certain locomotive engines for the Columbia and Portage Rail Ways. This proceeding appears to have produced considerable excitement at Harrisburg, and upon a motion to print an extra number of copies of his Excellency's message on the subject, considerable debate ensued; the motion, however, was carried by a vote of 41 to 25.—[N. Y. Amer.]

IMPORTANT DISCOVERY.—Peter Ritner, Esq., of Kirtland Clearfield co., Pa., has succeeded in making iron with mineral coal. This iron has been tried, and pronounced by iron masters to be of an excellent quality.—[Ib.]

It is stated in the Boston papers, that the Independence 74, in Charlestown Navy Yard, is about being raised into a frigate of the larger class, to mount 61 guns. The sloop of war Boston, of 24 guns, is nearly ready for sea, at the same yard.

The Philadelphia papers announce with every manifestation of regard and regret, the death, after a very short illness, of Robert Vaux, one of the Justices of the Common Pleas of that city, but better known here, and elsewhere, as the intelligent and indefatigable friend, and promoter, of every plan designed to improve education, restrain crime, and augment individual and national happiness.

Two men, Russell and Crockett, convicted of arson in Boston, have been sentenced to be hung.

BANK OF THE UNITED STATES.—At an election, on the 5th instant, the following gentlemen were

chosen Directors of the Bank of the United States for the ensuing year:

Nicholas Biddle, Thomas Cadwalder, Daniel W. Cox, Manuel Eyre, John Bolden, Ambrose White, John R. Neff, Caleb Cope, William Platt, Robert Ralston, Jr., Alexander Henry, Charles A. Davis, of N. Y., Matthew L. Bevan, Roswell L. Colt, of N. Y., Richard Willing, James Swan, of Maryland, Joshua Lippencott, John M'Kim, Jr. of Maryland, Henry Pratt, Wm. Drayton, of S. C.

And at a meeting of Directors, held the 6th, N. Biddle, Esq., was unanimously re-elected President.

MAIL ROBBERIES.—Some weeks ago, it was discovered that a depredation had been committed on the great mail between Maysville, Ky., and Zanesville, Ohio. A prompt investigation was made, and we learn with pleasure has resulted successfully.

A driver of the name of Reynolds and his confederate Wickerham, a storekeeper, it is said, at Sinking Spring, Ohio, have been arrested. Reynolds has confessed, and delivered up money and drafts. They were immediately taken to Columbus, where the Court of the United States being in session, they have been indicted.

At the same Court, Smith, a mail robber heretofore indicted, was convicted.—[Wash'n Globe.]

EXPERIMENT ON A DRUNKARD.—Ignition of human blood.—An experiment was recently made in Berwick, (Maine) by a student of medicine, on the blood of a common drunkard. The sot had probably swallowed two gallons of rum during the previous five days, during which time he had taken little or no food. The student remarked to him that he was in danger of perishing by spontaneous combustion, and stated that his blood was so much encumbered by alcohol that it could be ignited.—The drunkard asked to be bled. A pint of blood was taken from him. A bowl containing this blood was handed to one of the spectators, who ignited a match, and on bringing it in contact with the contents of the bowl, a conflagration ensued, burning with a blue flame for the space of twenty-five or thirty seconds.

[From the Albany Argus.]

ONONDAGA SALT SPRINGS.—The annual report of the superintendent of the Onondaga salt springs, and the inspector of salt in Onondaga county, made to the Senate on Saturday, exhibits the following results: Quantity of salt manufactured and inspected during the year 1835, bu 2,209,867 38-56 Amount of duty collected, \$132,792 Amount paid into the treasury, 121,856 28 Expenses of pumps, &c., 6,130 60 Collected for pumping, 4,445 67

LOWER CANADA.—To judge by the newspapers this province of the British Empire is on the eve of a revolution. The line of demarcation, which has for some time been rapidly manifesting itself, between the British settlers and the native French population, is now so distinct, that the British settlers are called upon by ardent writers in the newspapers, both of Montreal and Quebec, to refuse the payment of taxes, "because they are not represented," the Canadians having elected a great majority of their own countrymen to the Legislature.

Lord Gosford, the new Governor General, is charged with partiality for the Canadians and every thing that is French.

We infer, however—looking on as a spectator merely—that strict impartiality on his part is construed by those who have heretofore been the petted party, into partiality for their opponents.—At any rate the Governor General does not apprehend any difficulties, and thus cavalierly decline the aid of a volunteer rifle corps, raised "to preserve the constitutional rights of British subjects in Canada."

{ Castle of St. Lewis,  
Quebec, Dec. 28, 1835.

Gentlemen,—I have received and laid before the Governor in Chief your memorial dated the 23rd instant, in which, on behalf of yourselves and others, you pray the sanction of His Excellency to the organization of eight hundred effective men, in Montreal, under the appellation of the "British Rifle Corps," for the purpose of assisting, as far as may be in your power, to preserve inviolate the connexion which exists between Great Britain and Lower Canada, and to maintain unimpaired the rights and privileges confirmed to you by the Constitution.

I am desired to acquaint you in reply, that the

connexion and the rights which you mention, are not considered by His Excellency to be in danger; and that, if they were, their safety would be best provided for by the authority of the Government, and not by the formation, in a time of entire peace, of an armed corps at the instance of private individuals. Such a measure is calculated not to promote the good purpose you state you have in view, but on the contrary to endanger the public tranquillity, which, His Excellency desires me to assure you, he is resolved to maintain against all attempts, from whatever quarter proceeding, to the full extent of the powers vested in him by law.

I have the honor to be, Gentlemen, your most obedient humble servant,

S. WILCOTT, Civil Secretary.

Francis C. T. Arnold, M. D., Francis Hunter, Robert Weir, Jr., Aaron Philip Hart, Robert Mackay, Esquires.

This reply was submitted to a large meeting of the corps. Several addresses were made, and it was ultimately resolved that an answer should be transmitted to His Excellency, setting forth at length the numerous grounds which, in the opinion of the inhabitants of Montreal, call for the establishment of an armed body, for the maintenance of British supremacy. The corps still continues to advance in numbers, and are long will be composed of a thousand instead of eight hundred, as was originally contemplated.

MEXICO.—The unsuccessful attack by Mejia, aided by an American force, which he took with him from N. Orleans, upon Tampico, has led to the military execution of twenty eight prisoners, taken by the Mexicans on that occasion.

Abhorrent as such cruelty is to every feeling of humanity, it was a fate which those who left their own country to take part in a predatory attack upon a nation with which we are at peace, must have foreseen as possible—and have resolved to risk: there can, at any rate, be no ground for the interposition on the subject of the United States.

List of persons shot at Tampico at 8 o'clock in the morning of the 14th December, 1835.

EXECUTIVE APPOINTMENTS.—Among many of those recently made to, and confirmed by, the Senate, the following are of general interest:

Powhatan Ellis, to be Chargé d'Affaires to the United Mexican States.

R. M. Patterson, to be Director of the Mint.

J. C. Pickett, to be Fourth Auditor.

Franklin Peale, to be Melter and Refiner of the Mint at Philadelphia.

Edward D. Ingraham, Henry Tyland, Cheney Ickman, James Rogers, David Henshaw, to be Directors of the Bank of the United States.

In our State and vicinity:

Hiram Perry, Surveyor and Inspector at Albany, vice J. T. Vernon resigned.

J. R. Hardenberg, Surveyor of Perth Amboy, and Inspector of revenue for the port of New Brunswick, vice H. V. Low resigned.

The New York Stock and Exchange Board have appropriated to the Relief Committee \$1000. Fire Department \$250.

## A CARD.

TO THE SUBSCRIBERS AND FRIENDS OF THE  
RAILROAD JOURNAL, MECHANICS' MAGAZINE, NEW-YORK  
FARMER, AND APPRENTICE'S COMPANION;

All of which publications have been delayed nearly a month, in consequence of the destruction by the late conflagration of the press and materials with which they were printed. The Editor and Proprietor desires to say, that they will all be again regularly issued in a few days, and forwarded with care and punctuality.

In consequence of the heavy loss sustained by the fire, including not only nearly all my printing materials, but also nearly all my stock of back volumes, sheets, and numbers of the different publications, and all of my stereotype plates of five volumes of the Mechanics' Magazine, I am compelled to ask the indulgence of their patrons for a few days, until I can get a new office arranged, so as to present the works to them improved both in appearance and in matter—and as I have relinquished the management of the business department of the New-York American, for the purpose of devoting myself exclusively, hereafter, to my publications, I hope to render them more interesting and more useful than I have heretofore been able.

I am also induced by my losses, which amount to over eight thousand dollars, to request each friend of my publications to aid in extending their circulation, and of each present subscriber the favor to remit the balance due, if any there be, and in advance for the year EIGHTEEN HUNDRED AND THIRTY-SIX, that I may be able to make the works worthy of increased patronage, and useful to community.

D. K. MINOR, EDITOR AND PROPRIETOR.

New-York, January 15, 1836.

The following publications are issued by the subscriber, at No. 13 NASSAU STREET, New-York, viz:—

RAILROAD JOURNAL,

Devoted to INTERNAL IMPROVEMENTS, and the Improvements in Machinery—in weekly numbers, of 16 quarto pages each—price FIVE DOLLARS a year, in advance.

MECHANICS' MAGAZINE, AND REGISTER OF INVENTIONS AND IMPROVEMENTS,

Devoted to the interests of Mechanics and the Arts—published monthly, in large octavo form, of 64 to 72 pages each number—price THREE DOLLARS, in advance, or four copies for ten dollars.

NEW-YORK FARMER, AND AMERICAN GARDENER'S MAGAZINE,

Devoted to Agriculture, Horticulture, and Floriculture—published in monthly parts, of 32 to 40 quarto pages each—at THREE DOLLARS—in advance—per annum.

QUARTERLY JOURNAL OF AGRICULTURE, MECHANICS, AND INTERNAL IMPROVEMENTS,

Which will contain the choice articles of the above three publications—price THREE DOLLARS per annum, in advance—or four copies for TEN dollars.

APPRENTICE'S COMPANION,

A small work, in monthly parts, of 16 pages each, designed for APPRENTICES—price FIFTY CENTS a year, or eleven copies for five dollars.

The volumes of the above works all commence with January.

All letters or communications designed for either of the above works, should be addressed,  
post paid, to

D. K. MINOR,

No. 13 Nassau street, New-York.
